Florida's Fruit Industry Menaced

State and Nation Use Vigorous Measures to Control Fruit Fly

EDITOR'S NOTE—Producers in AMERICAN AGRICULTURIST territory are naturally interested in the probable effect of the Mediterranean fruit fly on their own business. We understand, because of our climate, that the insect will not spread this far north. We will be affected indirectly by high prices of citrus fruits and by the possibility of an increased demand for northern grown fruit and vegetables. Judging from past experience there is little chance that the pest will be eradicated, though it will doubtless be controlled. We, in this section, may well be thankful that our business is not menaced by this or a similar pest.

THE discovery of the Mediterranean fruit fly in central Florida on April 6, 1929, one of the most dreaded insect pests which attack fruits and vegetables, and the subsequent organization of both governmental and unofficial forces to undertake its eradication or control are matters of vital interest to the fruit and vegetable industry of the entire nation. In this, its first appearance on the North American continent, the fly invades the only continental division on the globe which has heretofore been able to boast the entire absence of infested areas, and it becomes the fifth unwelcome visitor on the list of destructive insect pests which are capable of destroying annually millions of dollars' worth of fruits and vegetables in the United States.

On Saturday, April 6th, J. C. Goodwin, Nursery Inspector of the State Plant Board of Florida, discovered some larvae in grapefruit which he was preparing for the evening meal in his home in Gainesville, and becoming suspicious as to the nature of the whitish grubs, asked some of his associates

By MARTIN HASTINGS

to assist in examining them. A tentative identification of the insect as fruit fly larvae was made, and on Monday specimens of the infested fruit were taken to Washington by the state quarantine inspector and definitely identified.

Federal government officials and depart-

in the infested area, the climax of these being a meeting of the State Plant Board on April 15th, at the conclusion of which an announcement of the discovery of the pest was given to the press, an area about twelve miles in length and six miles in width in Orange, Seminole and Lake counties was placed under complete quarantine, and regulations governing clean-up work and shipment of fruits and vegetables were published. Gov. Carlton of Florida and the State Plant Board released for immediate use an emergency fund of \$50,000 which had been in the State Treasury since 1925, and Federal and State officials and specialists met with the Governor and State senators and representatives who were then attending the biennial session of the legislature at the Capitol, to formulate plans for further legislative appropriation of funds for eradication work. The Adjutant General of Florida was sent at once to Orlando to cooperate with the State Plant Board and was given authority to post State troops on guard over fifteen roads leading out of the quarantined area.

Headquarters for the Plant Quarantine and Control Administration, United States Department of Agriculture and for the State Plant Board were established in the old Court House building at Orlando under the direction of Dr. Wilmon Newell, State Plant Commissioner of Florida. By April 17th a force of sixty officials, scientific workers and inspectors of the Federal government and State Plant Board was on the ground and with the assistance of Orange county and Orlando authorities the destruction of suspected fruit and treatment of groves had been begun. Intensive clean-up methods were utilized, preventive

Truckloads of oranges and grapefruit as they are dumped in pits to be treated with quicklime before they are buried.

"We can't take chances with oil"
say the men who make your tractor

41 out of 45 manufacturers use Mobiloil in Nebraska tractor tests*

The Nebraska state tractor tests mean more than just permission to sell in that state.

For these tests set a standard. The tractor manufacturer realizes, that no matter where your farm is located, you're apt to look to the results of the Nebraska tests to guide you when you buy a new tractor.

The tractor manufacturer can't afford to take chances.

He can't risk poor performance, unnecessary wear and tear or repairs. He wants to keep his fuel and oil consumption down to rock-bottom.

So—41 out of the 45 manufacturers whose tractors passed these tests relied on Mobiloil to lubricate their engines.

In fact, 31 farm tractor manufacturers go so far as to urge you, in their instruction books, to use Mobiloil in their tractors.

And Mobiloil is recommended by more automobile instruction books than any 3 other oils combined.

Cheaper than ever to use

The Mobiloil you buy now is the New Mobiloil, better even than the Mobiloil which has for so many years established one record after another.

The New Mobiloil may cost you a few pennies more a gallon—but less by the year. For you may save from 15% to 50% in oil consumption—you will have less carbon and fewer repair bills.

Buy in quantity and save

Buy a season's supply—the 55- or 30-gallon drum with convenient faucets. Your dealer's complete Mobiloil Chart tells the correct grade for your car, tractor and truck.

* Anyone selling tractors in Nebraska must first submit a stock model to the Agricultural Department of the State University for a series of thorough tests.

VACUUM OIL COMPANY
Makers of high-quality lubricants for all types of machinery

Wyandale Grange Burns Its Mortgage

By MRS. LESLIE COSLINE

IN a little hollow among the Concord Hills of Erie County, on a cross-roads corner stands the home of Wyandale Grange No. 1369. Motorists passing through often pause, map in hand, to read the road sign and inquire "Where is Wyandale?"—and when told "This is Wyandale"—glance around at the three or four houses, back at their map and then at the native, as if to question his sanity.

Time was, when with post office and store, blacksmith and wagon shops, and two nearby cheese factories—but that is another story. Feb. 23, 1915, this Grange was organized by County Deputy Walter A. Clark with a membership of thirty-three and when two years later the store building, large, comparatively new and well suited to its needs, was offered for sale and the question of buying arose, there was a sharp division of opinion. The conservative element said it could not be done; that it was impossible for so small an organization to pay so large a debt and that such an attempt would be sure to end in disaster.

An Incentive to Work

However, those having the vision prevailed, a majority voting to buy providing the financing could be arranged. Being without funds this was accomplished by giving notes, taken by members, to raise the amount necessary for the first payment and this little Grange found itself the owner of a home encumbered by three mortgages—and faced by the necessity of earning the money to meet its obligations. Once embarked on the venture, its opposers became zealous supporters.

Of income, the principal sources have been money received yearly for entering a Grange exhibit at Erie County Fair, Grange dances, dramas presented here by neighboring Granges and High Schools, and dramas given here and elsewhere by its members. To the public it is greatly indebted for hearty support. On dance night and drama night the roads are a-twinkle with lights of cars bringing the friendly crowds that have filled Grange hall and made possible the "impossible". Like many other Granges it has had its ups and downs. Following a considerable increase in membership interest after a while languished and meetings were attended only by a nearby and faithful few.

Burning the Mortgage

Then it took on a new lease of life and today with a membership of 50 is in a prosperous condition, free of all debt and planning on various alterations and improvements in the near future. Its 14th anniversary falling in the winter, the mortgage burning was deferred until May 25th when it was honored by having as speaker of the evening State Master Fred J. Freestone and State Treasurer, John Klies and wife of Hamburg and County Deputy Walter A. Clark and wife of Eden, also were present.

After the regular Grange meeting the families of members were admitted and Master Glenn C. Woodward, who also is Master of Erie County Pomona Grange, gave a brief address of welcome. The following program, well interspersed with music, was in charge of the lecturer, Miss Neva Tyrer. A detailed and interesting history of the Grange, given by its first Master, Willis G. Clark, was followed by a song "The Mortgage" composed for the occasion by a Grange member and sung by Overseer George Kestner. Then Master Glenn Woodward with appropriate ceremony, gave the mortgage to the flame and in an impressive silence it burned to a heap of blackened ashes. Deputy Clark afterward remarked that it should instead have burned to the sound of triumphant music.

State Master Freestone in an interesting address, brought out much that was instructive and entertaining, and State Treasurer Klies and County Deputy Clark each spoke in his usual pleasing manner after which there was a social half hour, with dancing, followed by the grand march to supper.

Mobiloil

Electric Power Companies Are Merging

Future Electrical Progress Depends on Fair Rates

IT was recently announced in the financial columns of the newspapers that many of the electric power and light companies in New York State have been combined or merged into four companies. This is of vital importance to every man, woman and child who lives in the country.

The table in the center of the page gives you the number of companies and the counties or parts of counties that they covered before the combine, and the companies and the territory covered by them after the merger. The consolidation was backed and financed by J. P. Morgan & Company of New York City. One super-power system will have a financial backing of \$450,000,000, and will connect every important city in New York State from Albany northward and westward. The system supplies more than 600,000 persons with electricity and the Niagara Falls plants and other power installations have a capacity of 1,700,000 horse power. There are also several large gas plants in the system.

These organizations and combinations are going forward with the electric light and power companies in the same way as they are with nearly every other kind of American business, except farming. Some time, possibly when it is

too late, farmers of America will wake up to the fact that they are unable to do business as individuals with the great corporations on every side of them. Teddy Roosevelt used to fight the trusts with his "big stick." Now we recognize that they have their good points if controlled. Can the people keep the power trusts under control?

Whether or not this combine of power companies of New York State will be detrimental to the people's interests will depend upon circumstances and in particular on the way in which the policies of the big power companies are conducted in the future. There is much potential possibility for good or evil.

Undoubtedly the next big development in the progress of country life will be electrical. In New

York State, for example, about 50,000 farms are equipped with electricity from power lines, and it is estimated that there are from 20,000 to 25,000 more individual home plants. So electricity is coming to the farm and the country home very rapidly. When the great water power resources of the State are properly harnessed and made to produce electrical energy as they should, then we will see a new day in mechanical development both in the cities and on the farms of this country. We have only begun to scratch the surface of mechanical possibilities.

Great Water Power Resources

New York State is especially rich in water power resources. These resources belong to the people. They should be and must be properly safeguarded so that the people keep control. On the other hand, we do not believe that the government should go into the business of developing and distributing electrical current, or into any other business for that matter. Some kind of a policy must be worked out by the State whereby the great power companies are given initiative and free hand enough to allow them to develop rapidly the electrical resources of the State and make a

Are You Getting Your Money's Worth

Potato Spraying Must be Thoroughly Done to Pay

WHEREVER potatoes are grown to any extent, sprayers are now busy in the field. Growers are practically unanimous in their belief that spraying pays though there is some indication that much spraying is done which does not give full returns.

The first point which is neglected at times is the method of making Bordeaux mixture. The important ingredient which prevents infection by blight is copper, but unless this is made insoluble it will cause severe burning of the foliage. The ordinary formula for making Bordeaux is 5 pounds of copper sulphate; 5 pounds of quicklime and 50 gallons of water. The first step is to make stock solutions of lime and copper sulphate at the rate of a gallon of water for each pound of material needed.

One common mistake is to mix these stock solutions of lime and copper sulphate together and then to dilute them to the proper point in the spray tank. Experiments show that where this is done the material will settle much more rapidly than it will where the copper sulphate is first diluted before the stock solution of lime is added. The spray in which the material stays in suspension longest is the best spray and for this reason the copper sulphate and lime should be diluted before they are mixed together.

Some of our subscribers report that it is difficult or impossible to buy lump lime locally. In many cases hydrated lime is used for making Bordeaux mixture. There are two reasons why it may not be quite satisfactory. The

first reason is that it may not be as fine as quicklime and there is also a chance that slaked lime which has been exposed to the air for some time will become air-slaked and useless for making Bordeaux mixture. It is also possible for quicklime to air-slake, but when this happens it turns to a powder but inasmuch as slaked lime is already a powder, the air-slaking is not apparent to the eye. Where slaked lime is used, it is necessary to use about one third more than where quicklime is used. Where slaked or hydrated lime is used, the Bordeaux will stay in suspension better if the lime is mixed to a creamy consistency with water and allowed to stand for some time before it is used. The spray material

will stay in suspension longer and will be less likely to clog the nozzles. Hydrated lime should also be bought as fresh as possible and then it is a good idea to test the Bordeaux mixture before it is applied.

This test is made by buying a little potassium ferro-cyanide at a drug store and dissolving it in water. This can be kept in a bottle and a few drops put into the Bordeaux mixture. If the drops remain yellow in color, the mixture is safe, but if they turn a brownish color it will be necessary to add more lime to the mixture. A few years ago it was discovered somewhat by accident that the addition of sugar to Bordeaux mixture tended to preserve it and to prevent possible spray injury. Bordeaux should always be applied soon after manufacture but even then a good precautionary measure is to add a tablespoonful of sugar dissolved in water to a hundred gallon spray tank.

Another point which has received a lot of emphasis is the necessity for applying the spray under heavy pressure. Bordeaux mixture acts as a protection to foliage and is in no sense a cure for blight after the plant has once been infected. This makes it apparent that it is necessary at all times to keep the plant entirely covered with Bordeaux. Bordeaux properly made and applied will stick for a long time, but the plant is continually putting out new foliage which makes it necessary to spray at frequent intervals. A sprayer which operates at low pressure will cover the tops of the leaves fairly satisfactorily,

Although good work can be done with a traction sprayer, a power rig can develop a higher pressure.

Why Not Standardize Milk?

IT is against the law to standardize milk sold in New York State. If standardization were permitted, there might be some chance of unscrupulous dealers taking advantage of the situation. But on the whole, the advantages of standardization far outweigh the disadvantages, provided of course that nothing is added or subtracted from milk but pure cream. What consumer, for example, can possibly object to milk that is testing 3 per cent having enough cream added to it to raise it to 3.5 or 4 per cent?

We would be interested to know what our dairymen readers think about asking the State legislature to pass a milk standardization law.

Replacing Cattle After the TB Test

WE have just been in a dairy section that has been through the TB test. Quite a large number of the cows reacted and were appraised and disposed of. We were interested in the fact that there was considerable opposition at first when the test began to be talked over in this community, but now, after the test is over, in spite of the fact that a large number of cows reacted, most of the farmers, with few exceptions, are satisfied. We were told that many of them were agreeably surprised at the fairness with which the appraisals were made and with the way in which the whole matter was handled. One farmer told us that most of his neighbors felt they got all that their cattle were worth.

Unfortunately, locating the reactors and disposing of them are only a part of this problem. The State authorities are handling the TB tests in a fair, and for the most part, satisfactory manner, but when it comes to replacing the old cattle with new ones, the trouble begins.

In the first place, when the farmer gets his money from the State, he may be tempted to put it in an automobile or in some other equipment which he thinks he needs, so that he does not have much left to buy new cows with.

Then he is faced with the loss of production for a time so that the money, upon which he may have to depend for a living, is short, and so he believes he is forced to buy new cows quickly. Then he finds there is a shortage of good cows in his neighborhood on account of the test and concludes that there must be a shortage

everywhere and that therefore high prices are justified. Such a situation makes a harvest for cattle dealers.

Our suggestion is for farmers to go as slowly as possible in making their replacements after a TB test. What if you keep a few less cows anyway? Records often show that a smaller dairy returns bigger profits than were obtained before the test was made. Take time to look around for new cows outside of your own community.

May we suggest also that if you do any buying of cows this summer try to get those that will freshen this fall in time to increase the milk supply during the short period. This will mean more money to you in the long run and will help to preserve our market from outside.

May we add that there is plenty of young livestock coming on. A year or two more and cattle will be much cheaper. Therefore, you should refuse to pay exorbitant prices.

New Egg Grades Are Good On the Whole

ALL of you who produce eggs in large or small quantities will be interested in the explanation of the new New York State egg grades which we are publishing on another page in this issue. On the whole, Commissioner Pyrke and the Department of Agriculture and Markets are to be commended for the very big improvement in these revised egg grades over the old ones. The new grades will help the market situation materially.

There are one or two provisions that we do not think will work out well. For example, there is the provision that Grade A eggs which are sold within thirty days may be called "fresh". Speaking strictly as a consumer of eggs, which we all are, no egg, no matter how well preserved in cold storage or otherwise, can be called a "fresh" egg in any manner of means that is thirty days, or even twenty days, old. It is just such regulations as these, which enable the dealers to call eggs "fresh" that really are not, that discourage consumers from buying, particularly those who are willing to pay high prices for really good eggs. Furthermore, we do not believe this provision can be adequately enforced.

Another provision in the new grades which we do not think will work out well provides that eggs containing blood clots may be sold in Grade C, provided there are not more than two such eggs to the dozen. Who wants to eat eggs containing blood clots? The answer is, very few persons, if they know it.

Rural Representation Decreasing

CONGRESS has recently passed the Fenn Reapportionment Bill giving the new population basis upon which representation in Congress will be based after the census of 1930. Farmers will be interested to know that they will lose rural representation in Congress by this new reapportionment. It marks officially the transfer of numerical control of the House from country to city voters.

The Fenn Act will cause most of the farming states to lose one or two representatives each, and other states showing a big and rapid increase in population will gain an equal number. In states where the total number of representatives remains the same, the large cities will gain at the expense of the rural sections. For example, Illinois as a whole will probably retain her present number of representatives, but Chicago will gain and the rural sections will lose. New York State will probably lose one representative and New York City gain one or more.

According to our Constitution, representation in the House of Representatives is based on the population. It is an interesting, and to a lover of the country rather a sad fact, that all representation, both in Congress and in the state legis-

latures, has rapidly changed in the last fifty years from country to city control.

Rural population is defined as people living in towns of 2500 or less. In 1900, the rural population on this basis represented 60 per cent of the total; by 1910 it had declined to 54.2 per cent, by 1920 to 48.6 per cent, and probably the new 1930 census will show barely 40 per cent rural population still classified as rural. Even this figure includes large numbers of persons essentially urban in their interests.

Actual farm population at the time of the 1920 census was less than 30 per cent of the total population, and in 1930 it will probably be not far from 25 per cent.

The most that we can hope for in our representation is to convince people who live in the smaller cities and towns, and possibly many of those in the larger cities, that their own welfare depends upon a successful and happy farm population.

Barnyard Golfers Warming Up

THE barnyard golfers are warming up, looking forward to the big statewide tournament to be held under the auspices of the Farm Bureaus, the State Fair and the AMERICAN AGRICULTURIST, at the State Fair this fall. We are beginning to get notices that the local county contests are being held, and some local winners are already set to go to Syracuse.

Let the good work go on. We know of no other game more adapted to every farm and country neighborhood, nor one in which there is more fun. If you are interested in taking part in the county or state contest, get in touch with your County Farm Bureau Agent.

Are You Going to St. Louis?

WELL, how about that St. Louis excursion to the National Dairy Show? It comes on October 12-19, you know, so it is none too soon to begin to make your plans. Is it not time that you and your good wife had a vacation? Here is the train schedule giving you the nearest city to get on the train:

Leave New York.....	5:30 P.M.
" Harmon	6:23 P.M.
" Poughkeepsie	7:30 P.M.
" Albany	8:11 P.M.
" Schenectady	8:40 P.M.
" Utica	10:07 P.M.
" Syracuse	11:18 P.M.
" Rochester	12:50 P.M.
Arrive St. Louis	5:00 P.M.

The fare and a half excursion rate is good from your own station.

AMERICAN AGRICULTURIST is organizing this train for our dairymen in order to give them a good time and to let them see first hand western milk production conditions. If interested, write us for further information.

Eastman's Chestnut

THE very efficient and genial Lecturer of the New York State Grange tells a good story that I am going to steal.

John and Mary had worked hard on the old farm for twenty years, and concluded that they needed a vacation. So they went down to Washington and among other wonders they visited the Washington Monument, and went up into the tower more than five hundred feet high.

Mary looked off across the panorama of one of the most beautiful cities of the world, a city of trees and parks. She gazed to the south into old Virginia and then turned to watch the historic Potomac winding its way to the sea. Finally, she turned to John and whispered:

"I'm speechless! Absolutely speechless!"

And John said:

"Let's buy the darn thing!"

News from the Publisher's Farm

THE State Agricultural College at Ithaca is certainly doing everything in its power to get the dairymen of New York State to increase their production next fall.

As a dairyman, I have received so far a very excellent leaflet, describing the various farm practices by which I can maintain my production through the summer months. In this morning's mail I have also received the following post-card:

Henry Morgenthau Jr.

"Dear Dairyman:

65,000 other New York State dairymen are reading this message this morning.

Watch the DAILY production of your cows. When it begins to drop, feed grain (18-20%) 1 pound to 5 pounds of milk for June and 1 pound to 4 pounds for July and August. On good pasture less grain than the above amounts may hold the daily production. It takes about 150 pounds of green feed to make 20 pounds of milk; 438 pounds of water for every 100 pounds of milk. Feed green feed and watch the water supply.

Hold the daily production of your cows.

SAVE YOUR MILK MARKET.
County Agricultural Agent."

These suggestions from the College are splendid and, if followed, will be very helpful.

Unfortunately, the path of least resistance is for us dairymen to make the maximum amount of our milk in the spring. The production figures for my own farm for the last five years give you a fairly good idea of how I have run my dairy where there has been no financial incentive to even out our production over a period of twelve months.

The following table shows that under the present price plan we have been making twice as much milk in June as in November.

	June	November
	Lbs.	Lbs.
1924	43,643	23,854
1925	41,761	26,431
1926	32,129	14,742
1927	41,827	22,053
1928	36,094	18,758

Beginning with April 1st I made a year's contract whereby I agreed to deliver a minimum of eleven and a maximum of thirteen cans of milk a day three hundred and sixty-five days in the year. I no sooner had made this contract when I immediately began to formulate plans to try to do everything I could to make good on our production.

The first thing that I did was to try to get as many cows as possible to freshen in the fall. Then I decided I would not breed any cows during the months of August and September in order that none of our cows would freshen during May and June which have been our peak months.

I have planted a considerable acreage of oats and peas to furnish green feed when the pastures are short. I have sown an extra large acreage of silage corn as I hope to fill my two silos full to the very top and, lastly, if I find that I am running short of milk, I am going to buy some cows that will freshen in the fall to tide us over our short period.

What I have told you above is the effect on me of a maximum and minimum milk contract. It means money in my pocket to try to produce almost as much milk in November as I did in June. I ask our subscribers who are dairymen, "What effect would it have on you, if you knew now that the quantity of milk that your cows produced during October, November and December this coming fall would be a basis on which you would be paid in the nine months following?"

I believe that the answer would be that you would go through exactly the same mental process that I have, namely, that you would get busy and try to increase your production next fall just as rapidly as possible because you know that it will mean dollars in your pocket.

If the dairymen of the New York Milk Shed wish to keep the metropolitan market, I think that some new

plan or a modification of the present fine plan will have to be devised which will not only increase the production of milk in the fall but also reduce the peak of production through the months of May and June.

Henry Morgenthau Jr.

Visits with the Editor

EUGENE Field was born in St. Louis in 1850. His father's people came from New England and Eugene spent many summers with his grandmother on an old Vermont farm. It is strange how ancestry counts in the lives of all of us. Eugene's grandfather was a lawyer of distinction in Vermont and his father and uncle were gifted in music, in the ability to express themselves, and both of them were fun-loving, joke-playing boys, never so happy as when getting a joke or a prank on somebody else.

All of these characteristics showed up in Eugene. He loved folks just as they were, made light of their faults, and emphasized their virtues. After two or three days' acquaintance, all of his friends called him by his first name. The two things that I like to remember about him above all else are, first, his boyishness, which, no matter how much he was afflicted with ill health or trouble, was forever showing up in his pranks and harmless jokes; and, secondly, his love of children. No writer in American or English literature has ever written quite so well on the joys and sorrows of childhood, or put into words the real feelings of all friends of boys and girls.

What a shame that the world should lose such genius right in the middle of his best work. Eugene was never very well and died in 1895 at the early age of forty-five.

Let us take a few moments to illustrate some of Field's Fun and Humor. Personally, I have great respect and love for any man who can make us laugh. It is easy enough to make us cry but what the world most needs is more laughter.

Unfortunately, Field was a busy newspaper man, and had little time for outside literary work. Also, much of his humorous work, printed in the newspapers of the time, has been lost.

The first book which he published, called the "Tribune Primer," was, however, composed of humorous sketches and was made up of short lessons in the form of a first reader. Probably there are not more than two or three copies of this old book still in existence. Here are a couple of "lessons" from this primer which I was able to find:

"The Peach"

"The Peach is hard and Green. He is Waiting for a child to come along and Eat him. When he gets into the child's little Stomach he will make things Hot for that Child. The Child who eats the Peach will Be an Angel before he Gets a Chance to Eat another. If there were no green Peaches there would not be so many Children-Sizes of Gold Harps in Heaven."

The following lesson was called "Mental Arithmetic":

"How many Birds are there in Seven soft-boiled Eggs?"

"If you have Five Cucumbers and eat Three, what will you have left? Two. No; you are wrong. You will have More than that. You will have Colic enough to double you up in a Bow Knot for Six Hours. You may go to the foot of the Class."

"If a Horse weighing 1600 pounds can Haul four tons of Pig Iron, how many seasons will a Front Gate painted Blue carry a young Woman on One Side and a young Man on the Other?"

Every man who knows the virtues of good old New England apple pie like Mother used to make will appreciate the sentiments expressed by Eugene Field in his humorous poem, "Apple-Pie with Cheese."

I'm glad my education
Enables me to stand
Against the vile temptation
Held out on every hand
Eschewing all the tittles

My Favorite Poem

WE WERE very much pleased the other day to receive a letter from Dorothy Schwerdtfeger, age 10, of Hicksville, Long Island, enclosing the verses of "The American Flag" by Joseph Rodman Drake. The poem was very carefully and neatly copied. Dorothy said that this was her favorite poem. Her judgment is excellent, better than lots of grown folks. Read the words of this stirring old piece which we print below in part and see if you do not agree with Dorothy.

Remember that we should be very glad to have you send in your favorite poem, and those poems that get the most votes will be published later in American Agriculturist and broadcast over station WGY, the General Electric Company's station at Schenectady. Tune in on station WGY every Thursday at noon and see if you do not like the readings prepared by E. R. Eastman, editor of American Agriculturist, entitled "Visits with the Poets of the Farm and Home," then send us your favorite poem.

The American Flag

When Freedom from her mountain height
Unfurled her standard to the air,
She tore the azure robe of night
And set the stars of glory there:
She mingled with its gorgeous dyes
The milky baldric of the skies,
And striped its pure celestial white
With streakings of the morning light;
Then from his mansion in the sun
She called her eagle-bearer down,
And gave into his mighty hand
The symbol of her chosen land.

Flag of the brave! thy folds shall fly,
The sign of hope and triumph high,
When speaks the signal trumpet tone,
And the long line comes gleaming on.
Ere yet the life-blood, warm and wet,
Has dimmed the glistening bayonet,
Each soldier's eye shall brightly turn

To where thy sky-born glories bairn;
And, as his springing steps advance,
Catch war and vengeance from the glance;
And when the cannon-moanings lead
Heave in wild wreaths the battle-shroud
And gory sabers rise and fall
Like shoots of flame on midnight's pall;
There shall thy meteor glances glow,
And cowering foes shall sink beneath
Each gallant arm that strikes below
That lovely messenger of death.

Flag of the free heart's hope and home,
By angel hands to valor given!
Thy stars have lit the welkin dome,
And all thy haes were born in heaven.
Forever float that standard sheet!
Where breathes the foe but falls before us,
With Freedom's soil beneath our feet,
And Freedom's banner streaming o'er us!

With vanity replete,
I'm loyal to the victuals
Our grandsires used to eat!
I'm glad I've got three willing boys
To hang around and tease
Their mother for the filling joys
Of apple-pie and cheese!

Your flavored creams and ices
And your dainty angel-food
Are mighty fine devices
To regale the dainty dude;
Your terrapin and oysters,
With wine to wash 'em down,
Are just the thing for roisters
When painting of the town;
No hippant, sugared notion
Shall MY appetite appease,
Or baste my soul's devotion
To apple-pie and cheese!

Another type of Field's whimsical humor is shown in the "Awful Fate of Little Jim":

Children, hear this dreadful story
Of a little boy named Jim,
That upon this day, Thanksgiving,
You may warning take of him.
Jim sat down to eat his dinner
On a bright Thanksgiving day,
Nor for bib nor even blessing
Would the little fellow stay.

Venison, partridge, quail and rabbit,
Sardines, lobster, chicken pie,
Down his little gullet vanished
In the twinkling of an eye.
"Look a'here my son," said Papa,
"You have eaten quite enough,
You'll be sick if you continue
To fill up on this 'ere stuff."

Last of all the round plum pudding;
Jim was looking very pale,
"James, my dear," his Ma protested,
"Something you must surely ail."
Jim rolled up his little eyeballs,
Put one hand upon his head
And the other on his stomach,
"I am feeling sick," he said.

Papa hastened for the doctor,
Mamma shrieked and tore her hair,
All too late to save poor Jimmy,
He had climbed the golden stair;
For there came a loud explosion,
Rending Jimmy all asunder,
Nevermore his form was witnessed,
He had barsted all to thander.

How many of us men may wish for Eugene Field's ability to express himself on an occasion like this, described in the little piece, "Only A Woman's Hair."

Only a woman's hair
Binding the now to the past,
Only a single thread
Too frail to last;
Only a woman's hair
Threading a tear and a sigh,
Only a woman's hair
Found to-day in the pie.

Field did not have much use for politicians, and when a campaign was on in his city his column in the newspaper was apt to be filled with little verses like these:

Some Bosses were playing with a mule
One cold November day,
The mole's still there, with apraised leg,
The Bosses, where are they?

Sing a song of caecus,
Senatorial pie;
Six or seven candidates
And none of them are high;
While the caecus wrangles
O'er the precious prize,
Along comes a dark horse
And nips it 'fore their eyes!

The poet loved to have his friends gather around him, and was always the life of the party, because there seemed to be no end of nonsense rhymes like the following that he could contrive at a moment's notice. Here are a few examples of these rhymes that have survived the years:

A maiden once ate a cucumber
And then she lay down for to slumber;
The next thing she knew
Up to heaven she flew,
Her casket was made of new lambs.

A certain young lady at Golden,
Once sought her best beau to embolden,
By observing, "Don't you
Think one chair's 'naff i'r two?"
And now when he calls, she is holden.

The beautiful belle of Del Norte,
Is reckoned disdainful and horthy,
Because during the day
She says, "Boys, keep away,"
But she yums in the gloaming like forty!

I cannot sing the old songs
I sang long years ago,
And yet I cannot say I'm sad
That time hath changed us so,
For when I used to sing those songs,
My Papa blankety-blanked,
And Mamma took me on her knee
And I, alas! was spanked.

There is a smile in this one called "The Good Boy and the Bad," and also more truth than fiction.

There was a worthy little boy
Whose name was Willie Hood;

A.A.'s Western New York Farm and Home Talk

Fruit Growers to Visit Virginia

By M. C. BURRITT

THE close of the third week in June saw the hot, dry weather relieved slightly by light showers here and there over the territory but in the main, Western New York is still in

the grip of a drouth which is becoming serious. Many of those who did not get their plowing done early have had to give it up—unable to keep their plows in the ground. And anywhere one sees teams or tractors fitting land they are followed by clouds of dust. Farmers who planted corn, beans, potatoes and cabbage early found moisture enough to bring up the crop in good shape, but late plantings are coming up slowly and unevenly if at all. A trip across the state during the week indicates that this dry condition is quite general.

M. C. Burritt

Haying Starts Early

Haying is well under way, earlier than usual and at least two weeks earlier than last year. The dry weather has checked growth and forced early bloom. Clover is in full bloom and alfalfa nearly so. It has been good haying weather. These factors are no doubt mainly responsible for the early haying which may be as much as 20 per cent under way now. But probably the educational propaganda by college and by the Dairymen's League for earlier cutting of hay to improve the quality has had considerable effect. At any rate the two factors have worked together well.

The fruit crop is in that stage of development where it is hard to say just what the crop is likely to be. This is the stage of pessimism when so many growers report that they have very few apples. The fruits are small, green like the leaves and hidden among the lush June leaf growth and very hard to see. And the "June drop" is still taking place. Apparently this is quite heavy both on account of frost injury and inadequate pollination. Scab, leaf roller and bud moth are taking their toll in poorly sprayed and unsprayed orchards. But from now on the crop will look bigger. There seems to be very general agreement that the crop is far from the promise of the heavy bloom. Many varieties including McIntosh, Greening and Twenty Ounce will be quite light. Early varieties like Duchess and Wealthy will be good, and where it bloomed well Baldwin has apparently set a good crop. While it is still too early to tell definitely what the crop will be, it is certain that early estimates will have to be revised downward. Pears will be a very light crop, peaches only a moderate crop, while cherries are spotted but generally light.

Thinning Pays

Where the set of apples is heavy as with many trees of the early varieties and in some cases with Baldwin, now is the time to thin. The earlier thinning can be done the better it is both for growing fruits and for next year's buds. By severe early thinning, it is possible to develop a tendency for annual bearing. Removing the excess fruits at this time gives the buds now forming for next year a much better chance. Severe thinning by pruning of such varieties as Wealthy may have somewhat the same effect. At least, after such pruning I have the best crop of Wealthys in the "off" year after a big crop last year that I have ever had. It has been well demonstrated that thinning pays not only in size, color, uniformity, and quality of

the crop, but in quantity as well. Increased size more than makes up for fruits removed and saves handling. Thinning is a practice which more of us should find time to do.

The State Horticultural Society has given up its annual summer meetings, both eastern and western and instead is planning with the help of farm bureaus in fruit counties, a big trip to the Shenandoah-Cumberland sections of the Virginias on August 7, 8 and 9. The trip which will be an extensive one, is being carefully planned by a special Farm Bureau-Horticultural Society committee, and it is hoped that several hundred growers will be able to go. The trip will begin at Martinsburg, West Virginia, on the morning of Wednesday, August 7, and the day will be spent in that state. Starting from Winchester, Virginia on the morning of the 8th the group will proceed southward down the valley to Harrisonburg and Stanton. There it will turn eastward across the Blue Ridge through Crozet into the Piedmont section to Charlottesville where it will break up in the evening of the 9th.

Plans Will Be Carefully Made

College and Farm Bureau representatives will go over the route in July in advance and carefully plan every stop so that there will be something worthwhile to see at each one. Eating and sleeping arrangements are being worked out with the same care and we can assure growers who go that they will be able to get an adequate idea of what this great competitive apple area which now exceeds New York in total production, is doing and how it does it. All the indications to date are that large numbers of growers are planning on making this their annual vacation trip. Many are expecting to take their families along. The total distance down and back will be about one thousand miles. —June 23, 1929, Hilton, New York.

Yields from Old Apple Trees

FRUIT growers will be interested in the table given below, showing the average yield of apple trees over thirty years old, taken from a recent survey of Western New York and published in Farm Economics by the New York State College of Agriculture.

It is interesting to note that the three best varieties were Twenty Ounce, Baldwins and Rhode Island Greenings. The yields were for packed fruit and did not include culls and ciders. For all varieties combined, culls averaged 15% of the tree-run-fruit.

For young bearing orchards 15 to 29 years of age, Wolf River and N. W. Greenings yielded the best. Rhode Island Greenings ranked fifth and Baldwins eighth among the twenty-eight varieties. McIntosh ranked twelfth yielding 2.27 bushels per tree. Of the twenty-eight varieties, the yields of Delicious were the poorest.

AVERAGE YIELD OF APPLE TREES OVER 30 YEARS OLD BY VARIETIES

Newfane-Olcott Farms 1918 to 1926		
Variety	Total number of Bushels of packed trees 1918 to 1926	fruit per tree
Twenty Ounce.....	3,022	5.50
Baldwin	157,668	5.33
R. I. Greening.....	82,786	5.33
Northern Spy.....	2,627	4.82
Tompkins King.....	12,436	4.78
Roxbury Russet.....	12,385	4.16
Tolman Sweet.....	2,128	4.11
E. Spitzenburg.....	3,006	4.05
Cranberry Pippin....	2,710	4.00
Golden Russet.....	1,377	3.55
All varieties.....	288,462	5.19

Well-colored apples have a higher market value than that of pale fruit. Cultivation of the orchard after June adds to the cost of the crop and reduces the color of the fruit.

Florida's Fruit Crop Menaced

(Continued from Page 1)

measures were used, extended scouting investigations were employed to locate other centers of infestation, all shipments of fruits or vegetables from infested areas were stopped, shipments from protective or secondary zones were permitted only under rigid inspection and government certification, and all traffic and transportation by rail, highway or other means out of the quarantined area were subjected to inspection and to confiscation of fruits or vegetables known to be possible hosts of the fly.

Federal quarantine regulations paralleling and supplementing State rules were put into effect, and within a short time headquarters for the Federal government's activities in eradication and educational work in ten southern states was established, in Atlanta, Georgia with P. A. Hoidale in charge. Shipments of all Florida citrus fruits and host vegetables to eighteen states and Porto Rico were prohibited by Federal order on May 16th. The State Legislature appropriated \$500,000 for eradication work, and the Federal government, upon recommendation of President Hoover, appropriated \$4,250,000 in addition to the \$40,000 emergency fund previously authorized by Secretary of Agriculture Hyde. Within two months from the time of the discovery of the fly the Federal and State officials in charge had assembled a force of 4,500 persons, including scientific authorities, specialists in various phases of insect eradication (among these being a number sent by other states and countries), administrative officers, accountants, stenographers, clerks, inspectors, field workers and laborers to handle the many details of a systematically organized fight against the insect. Fourteen carloads of machinery were sent by special freight from Toledo, Ohio, having been used there in corn borer eradication work. A large garage building near Orlando was secured, together with adjacent vacant property and trucks, spraying equipment of all kinds, tanks, tractors, insecticides, tools and other necessary materials were concentrated there in large numbers. Laboratories and a photograph studio were established and preparations made for a vigorous and possible prolonged campaign against the diminutive invader.

How the Insect Lives

The adult Mediterranean fruit fly is smaller than the ordinary house fly, with conspicuous markings of two white bands on a yellowish abdomen, glistening black spots on the back, and diagonal yellow bands and black vein outlines on the wings. The abdomen is quite broad and tapers off to a sharp point with which the female drills very small punctures in the skin of fruits in order to deposit her eggs. These punctures are too small to be seen except upon close examination. Within from two to four days the eggs hatch into minute larvae which feed upon the fruit, causing decay and the formation of soft spots. As the larvae

increase in size the spots spread, an opening appears in the middle of each and in a short time the fruit drops to the ground. The larvae burrow into the ground to a depth of two inches or less or hide under any object upon the ground. Here they are transformed into the pupa or chrysalis stage, becoming small brown seed-like objects, and in a few days the adult flies break forth, fly back to the tree or field and soon seek for fruits or vegetables in which to lay eggs. The time required to pass through these three stages depends upon climatic and other conditions, but in warm weather a generation every month is possible.

Affects Seventy Two Plants

The Mediterranean fruit fly is known to affect more than 72 kinds of fruits and vegetables, although most of the infestation thus far found, in Florida has occurred in citrus fruits. The manner of its introduction into the state is a subject for conjecture, as no satisfactory explanation of its presence has yet been offered. The fly cannot survive cold weather, nor does the female lay eggs in fruits which are not at least partially ripe.

The fly has been known to science for a hundred years and since 1842 has become established in the Azores, Spain, Algeria, Italy, Sicily, Tunis, South Africa, Australia, France, Tasmania, New Zealand, Brazil, Egypt, Asiatic Turkey, Argentina, Greece, the Island of Madagascar, Bermuda Islands, and the Hawaiian Islands, in which last named place the presence of unusually favorable conditions for propagation and spread of the fly has seriously handicapped horticultural development. Local conditions govern the economic importance of the pest, and in certain countries climatic checks on its development are of such a nature as to prevent it from becoming a serious menace.

Briefly, the plan of eradication now being employed in Florida provides for the establishment of a three-zone system, in which Zone 1, of the infested area, covers everything within a mile of the place where even one larva, pupa or adult fly has been found. Within this area all fruits or vegetables known to be hosts to the fly are completely destroyed, no further planting is permitted and no shipments of fruits or vegetables of any kind are allowed. The destruction of the fruit is accomplished by stripping from the trees and gathering from the ground all mature fruit, regardless of condition, dumping it into a deep trench or pit and covering it with abundant quicklime. Water is sprinkled over it to get action from the lime, and oil is then poured over the fruit and it is buried under at least three feet of soil. Previous to the removal of the fruit the trees are sprayed with a mixture of arsenate of lead, molasses and water, or some other spray of proven efficacy in attracting the newly hatched flies, which eat it and are killed. In some instances fruit

(Continued on Page 13)

THE THRILL of DISCOVERY

THE thrill of discovery is part of the reward meted to the pioneer. But to the pioneer in industry the real reward comes in the knowledge that he has given the wheels of progress another forward turn. And having done so, his burning purpose is to pioneer again, to progress further, to find a better way.

The value of the pioneer in the fields of scientific poultry and dairy feeds would be hard to compute in actual dollars and cents. But just one of the discoveries of the present century, dry mash feeding—first introduced by The Park and Pollard Company—must have effected economies in labor and increased profits to the tune of millions of dollars within the past twenty-five years.

In order to pioneer a new feed so that it is of value to the public we must accomplish far more than mere discovery. The public must be able to buy it easily and must learn to appreciate its advantages. Yet all the effort has to be directed with the end of economy in view, for you must be able to buy the feed at a price that will show you a profit.

And further pioneering must continue. New feeds that are better than the old must be developed. There can be no standing still for those who have pioneer blood.

*To be sure of profit-making feeds—

What happens when you don't say "LARRO"?

IF YOU think all feeds are alike, or if you judge value by price comparisons only, consider what's happening in the feed world today.

"FEEDSTUFFS", a weekly newspaper for the manufacturer, jobber, broker and feed dealer, says:

"Retail feed dealers are making inquiry for flax and wheat screenings in which molasses have been mixed. These are used in preparing dairy feeds."

A Machinery house advertises to feed dealers:

"Plenty of scabby or rusty barley can be had at low prices. By giving it a good mechanical scrubbing it can be made quite satisfactory for feeding purposes. The appearance is improved 100 per cent."

Those who judge value by price comparison only always come out on the short end of the deal.

Wise feeders everywhere have learned that the best way to maintain the health of their cows, hogs and poultry is to say "LARRO."

Ask any user of Larro Feeds and he will tell you that they do not contain any fillers or off-grade ingredients. They will tell you further that year in and year out Larro Feeds do not vary in appearance, chemical analysis or profit-bearing results.

Years of careful testing on the great Larro Research Farm developed the formulas that excel all others in sustaining health and making money.

Don't take chances when it is so easy to say "LARRO," and so make sure that your farm stock will be healthy and your profits will measure up.

With the A. A.
DAIRYMAN

A Personal Experience with the TB Test

IN 1926 my dairy consisted of 110 head of untested cattle. Of this number, 70 were milking, the balance being young stock. The best day's milk from these cows was 2,235 pounds. In September and October a few of these cows began to lose flesh and gave very little milk although fed the same as the rest of the herd. A short time later these cows died and upon opening them, I found them badly affected with T.B. In the spring of 1927 I raised twenty heifer calves, but even with this addition my herd was growing smaller owing to losses.

From January 1st, 1927 to January 1st, 1928 I lost thirty head of cattle. In the spring of 1928 I raised eleven calves but was still losing cows with T.B. I decided that I would have to stop this disease or quit dairying. Therefore, in July 1928 I canvassed the entire town of Lewis in Lewis County, with a petition with the result that 95% of the dairymen of the Town signed the petition to have their herds tested for T.B.

Every Cow in Town Tested

During the first part of September the testing was started and before these herds were all tested the balance of the dairymen in the Town signed for the test with the result that every cow in the Town of Lewis has been tested.

Within one week from the time the reactors were shipped the farmers received a check for the amount for which the cows sold in Buffalo, N. Y. The balance was paid by the State within thirty days.

At the time the test was made, I had (87) eighty-seven head and every one was a bad reactor. As soon as my barns had been disinfected I started buying a new herd. I purchased thirty-nine (39) cows and one bull, part of these being springers and part being booked to freshen through the winter and spring. After I had my new herd home I had them blood-tested for abortion. Two grade cows reacted to this test and were sold at once. One cow died at time of freshening, thus leaving my new herd at thirty-six (36) cows. But although my new herd was greatly reduced in numbers, the figures that follow will show that my milk production increased.

The best day's milk record for April 1928 with 55 cows showed a production of 1,080 pounds of milk. The best day's record for November 1928 with 15 T.B. TESTED cows milking showed a production of 958 pounds. But the best day's milk record for April 1929 with 23) twenty-three T. B. TESTED cows showed a production of 1114 pounds of milk. I have not fed the new herd any more grain per head than I did the old herd.

In conclusion, I believe few dairymen in New York State have had more direct experience with T.B. than myself. It is my opinion based on my actual experience that 20 cows free from T.B. would be more profitable for the farmer to keep than 50 head affected with this disease as my dairy was affected.—BYRON W. TRAINOR, West Leyden, N. Y.

Electric Power Companies Are Merging

(Continued from Page 3)

reasonable profit from their investment and work. At the same time, the State must keep enough control of its water power resources and of the electrical companies themselves so that the people are not robbed of their fundamental rights.

The leaders in the State government who can solve this problem of water and electric power development properly will be statesmen indeed. It is the

(Continued from Opposite Page)

outstanding job now before the nation and all the state governments.

As an illustration of what electricity can do for the farm and home, let us take just one farm home job that has been the bugbear of the farm woman since time immemorial; that is, the weekly wash. As a boy, how the writer always dreaded Monday morning and the irksome job of turning the old washing machine. But even this was better than scrubbing the clothes out by hand, as was once done by all women, and is still done by many women at the present time. But with a good electric machine, and cheap electric current, the hardest job of the home is turned into one of the easiest ones. Then when the clothes are ready to iron, what an improvement the electric iron is over the old method of heating the flatirons on the kitchen range on a July day.

Another disagreeable job hated by most women is cleaning the kerosene lamps. How different from snapping on an electric bulb! And how different is the light also; how it brightens up the home. How much easier and safer it makes doing the chores in the dark fall evenings when there is electricity in the barns.

There is no limit to the different kinds of electric devices and machinery which can be used to lighten the farm work if—and what a big “if” this is—the electric current can be secured at a reasonable rate.

Now what are the possible effects of this merger of the power companies? In the first place, there is a chance for uniformity in rates. Almost every section of the State pays a different rate. It stands to reason that some of these rates are too high. We will watch with interest to see if the electrical companies make them uniform, and especially if they scale them down to the lower rates prevailing in some sections rather than scaling them up to the high rates now found in other places.

Give Us Uniform Policies

Another good possibility in this combination of power companies is that it should lead to uniform policies in dealing with farmers. For example, some of the small companies have been making farmers pay or help to pay for the line extension from the main line to their homes. Others have rebated this back after the farmers had used current for a certain length of time. Some never have paid it back.

We can understand how it is a big expense to a power company to put in an extension for a farmer living some distance from the main line. Possibly the farmer should in justice pay some small part of making this extension. But if later he uses a goodly amount of current, then we think the company should make him a rebate. After all, it is the power company and not the farmer who finally owns the line, and, moreover, there certainly should be a uniform policy on this and all other varying customs now used in extending electrical current into the rural districts.

One good effect of the merger should be the elimination of small middlemen companies who buy the power at reduced wholesale rates and re-sell it to the consumer, putting their unnecessary service and costs on the consumer.

Very fortunately for many isolated farms far from a power line, there is the very efficient individual electric plant. It would be hard to measure what these small individual plants have brought to farmers in terms of service and happiness in recent years, and in many sections the individual plant is still the only hope for electrical power and light for many years to come.

We will watch with great interest the new power companies in New York, hoping that their officers will have a sympathetic attitude toward extending reasonably priced electrical current into the rural districts. At the same time the people of the State of New York are going to look to the legislature and to the Governor for a sound State policy as a guide for the great development in water and electrical power that is sure to take place in the next few years.

15 Exclusive Features

On the NEW De Laval Magnetic Milker

THIS wonderful new milker has 15 distinct and exclusive features not found on any other milker, and which make it the world's best. The De Laval Magnetic is distinctly not a one-feature milker but is a combination of scientific knowledge and engineering skill which puts it far ahead of any other method of milking.

Also the new De Laval “Utility” Milker for the low price field.

See your De Laval Agent or write nearest office below for full information.

MILK 4 COWS

FASTER CLEANER AT ONE TIME CHEAPER EASIER

Don't Buy Any Milker Until You Find Out About the New PAGE Hi-Speed Visible Milker

For fifteen years Page engineers have been busy constantly improving and perfecting mechanical milking—their inventive genius has eliminated pipe lines, installation cost, harmful constant suction, troublesome pulsators, and prohibitive prices. They have now perfected for the dairy an amazingly simple and efficient, *visible, high speed* milker at a *new low price*. This milker is valveless, fully portable and practically self-cleaning—

Special Offer

No Other Milker Has These 6 Big Features

- 1 Visible Milk Flow—you see the full volume of milk as it comes from the cows at each stroke of the pump and know when they are milked out. No guessing.
- 2 Hi-Speed Milking Device—milks faster with less vacuum and is easier on the cows.
- 3 Total release of suction at each stroke of the pump with a push back of fresh air, which ventilates the teats, rests the udders and permits normal blood circulation. The Page *does not use constant suction*.
- 4 Vacuum is instantly Adjustable—to suit the cows. Prevents overstraining easy milkers.
- 5 No pipe lines—No installation cost. The Page Milker is fully portable. Just wheel it into your barn and start milking.
- 6 Easiest to Clean and Sterilize—No special cleaning equipment to buy. It practically cleans itself.

WHY be satisfied with any Milker that does not give you all these advantages. Get the facts today. Send the coupon for complete information and our profit sharing offer.

Profit Sharing

To quickly introduce this latest and best development in Page Milkers, a special confidential PROFIT SHARING proposition is now open to one actual dairymen in each community. The first responsible dairymen who answers from each community will be offered this confidential profit sharing opportunity and special offer, so don't delay.

"Go to a Hardware Store"

YOU get this story everywhere from everybody, as an answer to the question—“Where can I get—?”

It is the hardware store that people look to for the unusual, for tools, utensils and equipment for nearly every kind of work inside and outside the home, around the farm or in the shop. Thoughtful people say, “Go to a ‘Farm Service’ Hardware Store,” because in these dependable, aggressive stores you find the most complete lines, the most helpful personal service and values that give you the utmost for the money you spend.

Look for the “tag” in the window as you enter a hardware store. The “tag” design is a pledge of this group of merchants to help you in every one of the many ways that a hardware store can.

★ You will find machinery repair parts, paints and builders' hardware of the best quality at the lowest possible prices at your local “Farm Service” Hardware Store. It is a good thing for you to have these things on hand now so that you can make necessary repairs during your spare moments. Tell us what you want to do, and we will help you pick out the things to do it with.

Look for this tag in their window.

Your Farm Service HARDWARE STORES

Where prices are lower because you get personal help in the selection and maintenance of your purchases.

Reviewing the Latest Eastern Markets

Milk

The following are the July prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		
2A Fluid Cream	2.16	1.95
2B Cond. Milk		
Soft Cheese	2.41	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class I League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Pressure Causes Butter to Yield

CREAMERY	June 26, 1929	Last Week	Last Year
HIGHER THAN EXTRA	44 -44 1/2	44 1/2-45	45 1/4-45 3/4
Extra (92sc)	43 1/2-	44 -	44 1/4-
14-91 score	39 1/2-43	40 -43 1/2	41 -44 1/4
Lower G'ds	38 -39	38 1/2-39 1/2	40 -40 1/2

Hot weather, a more restricted consuming demand and heavy receipts were too much for the butter market to fight off. On June 22, the market finally gave way after a rather determined effort to hold prices where they had been. It is generally accepted in the trade that the week ending June 22nd represented the peak of the season. It is expected that the flush will continue for a couple of weeks because conditions in the producing areas are said to be very favorable. A few sections report a slight shrinkage and as pastures begin to yield before the heat of the sun we will undoubtedly see the shrinkage become more widespread—but not for a couple of weeks. Reports from most producing sections say that pastures are in extremely good condition.

At this writing the weather is greatly improved compared to what it was a week ago and that fact helps the market to some degree. However, there is no question but what the consuming demand is more restricted. In the first place, the exodus has commenced to mountain and seaside resorts. Furthermore, the retail price has been advanced to 51c which has had some effect on the buying public.

Cheese Market Unchanged

STATE FLATS	June 26, 1929	Last Week	Last Year
Fresh Fancy	24 -25	24 -25	25 1/2-26 1/2
Fresh Av'ge			
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	30 -32
Held Av'ge			29 -30

There is no change in the cheese market as far as quotations are concerned but there seems to be an undertone that would indicate an upward trend. One large operator is reported to be taking New York State cheese on the basis of market milk prices and these cost 25 1/2c f.o.b. State factory. Others refuse to operate on this basis. There are one or two lots of fresh State flats said to be offered at 24c to 25c.

Eggs Regain Lost Ground

NEARBY WHITE	June 26, 1929	Last Week	Last Year
Hennery			
Selected Extras	38 -40 1/2	37 -40	37 -39
Average Extras	36 1/2-37 1/2	35 -36	36 -37
Extra Firsts	34 -34 1/2	34 -34 1/2	33 -35
Firsts	33 -33 1/2	33 -33 1/2	31 1/2-32
Undergrades	31 -32	31 -32	30 -31
Pullets			
Pewees			
NEARBY BROWNS			
Hennery	34 -40	34 -40	36 -37
Gathered	31 -33 1/2	31 -33 1/2	30 1/4-35

The egg market has picked up the loss we reported last week although the situation is none too steady. Because of the liberal supplies of average offerings, breakers are still holding off which is a fly in the ointment as far as the entire market is concerned. On June 27, the weather had moderated considerably and there were some who looked for a steadier development. However, we have got to face the fact that we are now in the vacation period and there will be a heavy exodus to mountain and seaside resorts which is sure to have its effect on the consumer demand.

Live Poultry Fairly Steady

FOWLS	June 26, 1929	Last Week	Last Year
Colored	-27	26-28	-29
Leghorn	25-26	24-25	18-24
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	30-45	38-48	27-42
Leghorn	25-33	25-34	15-30
CAPONS			
TURKEYS	25-35	20-30	
DUCKS. Nearby	20-25	20-25	20-22
GESE	16-17	16-17	

The market on live poultry coming in via express and truck is fairly steady both on fowls and broilers although prices on broilers are not up to last week's level. Cars coming out of the West are heavy with broilers and they

are flooding the market with average goods. They carry a small percentage of fancy stock and buyers are turning to the express market for fancy stock. Therefore, those shippers who have been fitting their birds are reaping the benefit.

Fowls have been quite a problem. Heavy shipments have been coming up from the South and most of the cars have contained poor quality Leghorn hens that have been a drug on the market. Consequently fancy fowls have been moving fairly well usually at the freight price or a cent premium. On every hand it is becoming increasingly evident that unless the broilers get some fitting the shipper has got to take pot luck. For a special ration for fitting broilers we call your attention to the article on page 12.

Feeds and Grains

Medium Grade Hay Lower

Liberal supplies of medium and lower grades of hay have resulted in lower prices while No. 1 timothy which is scarce still remains at \$26 to \$27 per ton. Timothy containing mixture of grass or clover is quoted anywhere from \$18 to \$25 depending on grade, while straight timothy seldom brings more than \$24, except, of course, for No. 1.

Meats and Live Stock

Live veal is meeting an excellent demand. A few are bringing \$17.50 but good to choice generally range from \$15 to \$17. Mediums generally are around \$13 to \$14.

Lambs are active and firmer with prices 25c higher. There are seldom any worthy of better than \$14.25 although occasionally we hear of \$14.50 for choice stock.

Rabbits are slow generally bringing from 16c to 20c per pound.

Country dressed veal calves are coming in rather sparingly but the market is weak, irregular and there is little or no indication of any improvement. Country dressed veal calves have been especially hard hit by the warm weather. Many have been arriving in a mussy and bad condition. Others go down very quickly on receipt, due undoubtedly to the fact that they have not been properly cooled and the transit conditions have not been satisfactory. Shippers should get the animal heat entirely out of the carcass through cooling and then ice heavily before shipment in order to have the calves come through in good condition.

Briefs on the Fruit and Vegetable Trade

Sweet and sour cherries from the Hudson Valley have at last made their appearance in the market. Prices have varied greatly due to the irregular quality. Sweet varieties generally bring from 10c to 15c per quart basket with reds a nickel higher. Some extra choice reds have sold up to 25c. The best reds in four quart baskets have brought \$1 with others at 75c. Red sours have generally sold from 15c to 18c with a few as high as 20c, with four quart baskets mostly at 75c. Twelve quart baskets range from \$1.50 to \$2.00.

Red currants and gooseberries from the Hudson Valley have started to ar-

rive. Currants generally bring from 16c to 20c per quart basket, while gooseberries sell from 15c to 22c and 50c to 75c per four quart basket.

Toward the end of last week the first car load of strawberries came from Oswego County to meet a considerably improved demand. Prices generally ran from 10c to 35c depending on quality.

Orange County celery is becoming more plentiful. Rough goods do not seem to be as strong, while bunches have held steady. Market reporters have experienced some difficulty in collecting market quotations on celery which was packed and shipped in the rough due to the many different size packages used and the omission of marking the numerical count on the package, which is in direct violation of the State Agricultural Law.

According to the New York State Department of Agriculture and Markets, the eight second early potato states have an estimated crop of only 11,593,000 bushels or 6,400,000 less than last season. Lighter average yields as well as reduced acreage account for the decrease. New Jersey is likely to have only 5,800,000 bushels compared with 7,290,000 in the 1928 season.

Are You Getting Your Money's Worth

(Continued from Page 3)

but blight can enter the leaves just as well through the underside as they can at the top. The sprayer which applies material at a high pressure will cover the underside of the leaves as well as the top. Older types of sprayers were horse-drawn traction outfits which might develop from 125 to 200 pounds of pressure and served fairly well. However, the motor-driven sprayer which is coming to be the generally accepted standard will develop from 250 to 300 pounds of pressure or even more and will do a much better job of spraying. Where power sprayers are not available, traction sprayers, of course, are next best. When the vines attain any considerable size, best results are reported by using three nozzles to each row; one directly over the row and one on each side which are pointed upwards to hit the undersides of the leaves.

Experiments have commonly shown an increase in yield for each additional spray applied up to seven or eight applications. In order to keep new foliage covered it is necessary to spray every ten days or two weeks. The most important time for applying a spray is just previous to rain. Of course, the material should have time to dry so that it will not be quickly washed off, but a rainstorm is one of the best methods of spreading blight and the foliage needs to be protected at this time.

At one time, the Colorado potato beetle was a serious pest but like many other insects, we have learned to live with it and this pest is at present one of the minor problems of growing potatoes. It is easy to add arsenate of lead paste (6-10 lbs. to 100 gallons), calcium arsenate (5 lbs. to 100 gallons) or Paris Green (1-2 lbs. to 100 gallons) to the Bordeaux mixture when needed. Where leaf hoppers or aphids are abundant, it is also possible to add a tobacco by-product (1 quart to 100 gallons) to the spray to combat these pests.

Spray material and machinery are expensive, and the grower is justified in using every possible means to protect his investment. First, every sprayer should have a sediment strainer, through which the spray material goes before it reaches the pump. This prevents clogging of the nozzles and keeps gritty material from injuring the pump cylinders. It will pay at the end of each day's spraying to remove the nozzles, clean them, and flush out the machine by pumping clean water through the pipes.

It will be profitable to study the whole proposition of spraying to be sure that you are getting the best possible results from it.

"SAFETY FIRST"

"Come away! That's no place for a little bug like you! Can't you see those vines are sprayed with Pyrox?"

PYROX, the scientifically prepared triple-duty plant spray KILLS BUGS, prevents the development of blight and disease, and stimulates plant growth. Users report \$25, \$35, and \$50 EXTRA PROFIT per acre from potatoes and other vegetables sprayed with PYROX. Safe, quick, and easy to use—and sticks. All sizes from 1 lb. jars to barrels. Now priced lowest in 30 years' successful use. Write us or ask your dealer for new Spray Guide—free. Bowker Chemical Company, 419 Fourth Avenue, New York.

Farm News from New York

Chenango County Producers Not Enthusiastic About Farm Relief

It happened that the day after the Washington legislators passed the so called farm relief measure I was out among farmers all day. It is mild to say that our New York farmers display no enthusiasm respecting the new law. There was no hostility anywhere but simply the belief that no real benefit is likely to reach farmers from it, at least not our eastern farmers and there is doubt of benefits to others. At the same time, I doubt if any of these men would have been better satisfied had the bill failed to pass. Really they want to see how it works and what comes of it.

There is a very general belief that the present times are about as favorable for the New York State farmer as they are likely to be for some time. Milk they say is bringing pretty good prices and with here and there an exception they hold that the fall and winter prices promise well. For the man who is favorably situated and able to do a good day's work there is a chance to get ahead a little. Cows are regarded as being rather too high, yet the man who raises them thinks he isn't making much. Those who are testing for TB are glad of the high prices when they lose some and sorry when they buy more. I do not find much opposition to the test where I have been and much of this appears to be due to liberal appraisals.

Have been spending some little time along the line of the old Chenango Canal. That was a big undertaking when it was built and led to many disappointments as well as many benefits. Along these valleys and on the uplands new seeded and alfalfa, where grown, is making a good showing but old meadows will need much rain as well as warm weather if we get a good crop. I have taken considerable interest in tracing the canal. It passed through the length of my home county of Chenango and connected with the Mohawk, or rather the Erie Canal at Utica with the Susquehanna River at Binghamton. Most of the way its route is easily followed but nearer Utica it is difficult to trace its course. At Clinton, on the Oriskany Valley, you find its course but the Oriskany Creek flows into the Mohawk several miles to the west. More than that there is the Sanquoit between it and the city. It is comparatively easy to find the route of the old Erie Canal through Utica. I have asked many farmers and an old city engineer and surveyor where the Chenango Canal joined it and haven't found

out yet. It is pretty evident that it left the Oriskany Valley somewhere north of Clinton and must have crossed the Sanquoit not too far from New Hartford. In short, the Ontario and Western Railroad very likely follows closely along its line. It had a big climb between Utica and Oriskany Falls.

We look at our present day progress in great pride and wonderment, but if we will just stop a moment and consider what our forefathers of a hundred years ago, more or less, had to do with, I am not sure but we would give them the prize for energy, daring and endeavor, yes, and for accomplishment. However, humans do not differ greatly as the years come and go. We have added blessings and so many favorable surroundings and advantages to be thankful for that it stands us in hand to look at the efforts and gains of those earlier residents in a very humble frame of mind.—H. H. LYON

Farm Tariff Still Being Discussed

ALTHOUGH both the Senate and House of Representatives are taking a recess during the summer, the Senate Finance Committee is remaining on the job to hold hearings on the proposed tariff changes. Hearings on the agricultural tariff began on June 17, and were completed June 24. Among those who testified was Louis J. Taber, Master of the National Grange, who pointed out that a comparison of the advalorem increases; that is, the tariff as compared with their money value, on agricultural and industrial products shows that the proposed tariffs on farm products are considerably lower than the advalorem duties on other products and suggested an average advalorem increase of ten or eleven per cent on agricultural products beyond the rates proposed in the House Bill. Chester Gray, Washington representative of the Farm Bureau Federation also asked for a general upward revision of duties on agricultural products.

4H Club Members Attend Washington Camp

APPROXIMATELY 150 boys and girls have just attended the Third Annual 4-H Club Camp at Washington. Those attending from New York State were: Maude Hilliard, Rochester, Monroe County; Virginia Phillips, East Bloomfield, Ontario County; Ralph Johnson, Caledonia, Livingston County; and Francis Oley, Manlius, Onondaga County. They heard talks by R. W. Dunlap, As-

sistant Secretary of Agriculture, Secretary of Agriculture Hyde and Mrs. Herbert Hoover who personally presented the trophies for outstanding 4-H Club members. The girl's trophy was presented to Helen Drinker of Virginia. The boy's trophy was presented to John C. Jackson of Louisiana.

Plant Lice Attack Maple Trees

REPORTS from various sections in the East, indicate a serious outbreak of plant lice or aphids which attack maple trees. These plant lice are very small, but also very numerous and suck the juices from maple leaves. At the same time they deposit a sticky substance known as honeydew on the upper surface of the leaves in such quantities that in many cases it drips off the trees to the ground. Leaves are falling in large numbers from badly infected trees. We are assured that this insect is not new but that in some way conditions have been especially favorable for the development this summer. We are also assured that there will be no serious permanent injury to trees by this insect.

Motor Inspector Dismissed For Accepting "Tip"

THE New York State Tax Commission recently announced the dismissal of George Holcomb of Syracuse, a motor vehicle inspector, for misconduct in office. According to charges which Holcomb has not answered, about a dozen Syracuse residents made arrangements with auto salesmen to secure their licenses and that Holcomb brought the applications to various county clerks' offices, stating that the applicants had passed the required test, although the persons involved had never taken the required test.

Charges are also pending against several other inspectors. For some time there have been stories that it was possible to get a driver's license by tipping inspectors and Commissioner Lynch of the State Tax Commission asked for the whole-hearted cooperation of the general public in wiping out any such illegal practices.

Pennsylvania Notes

Potter County—The hay crop seems light although there are a few good pieces of clover. Oats are thin and spotted. Many farmers have barely finished planting their potatoes. Quite a large acreage

of buckwheat is being sown. There will be fruit regardless of the heavy frosts the past month. Eggs are 30c, butter 50c, old potatoes 50c.—Mrs. H. E. J.

Coudersport High School graduated the largest class in its history. Droughty condition broken by local storms but rainfall is insufficient. Many weeds are appearing in the meadows. Barley is coming into favor among dairymen in the county. The Dairymen's League is active in the effort to increase the supply of fluid milk. Mr. Lewis, Secretary of the Commonwealth, claiming to be most "garden-minded of Gov. Fisher's official family" opened the Peony Show of the Harrisburgh Garden Club the first week of June. Local prices: eggs 30c, cheese 23¼c, calves 13c.—M. C. S.

Visits with the Editor

(Continued from Page 5)

He was as poor as poor can be,
But he was very good.
There was another little boy
Whose name was Jonas Ladd;
And though his father reeked with wealth
The boy was very bad.
When Christmas came and Santa Claus
Went hovering about,
Bad Jonas got his fall of track,
Good Willie went without.

Field's humor was at its best, however, in his nonsense rhymes for children. All of us are familiar with "The Duel," but it is something that never grows old, and is always worth repeating.

The gingham dog and the calico cat
Side by side on the table sat;
'T was half-past twelve, and (what do you think!)
Nor one nor t' other had slept a wink!
The old Dutch clock and the Chinese plate
Appeared to know as sure as fate
There was going to be a terrible spat.
(I wasn't there; I simply state
What was told to me by the Chinese plate!)

The gingham dog went "bow-wow-wow!"
And the calico cat replied "mee-ow!"
The air was littered, an hour or so,
With bits of gingham and calico,
While the old Dutch clock in the chimney place
Up with its hands before its face
For it always dreaded a family row!
(Now mind: I'm only telling you
What the old Dutch clock declares is true!)

Next morning, where the two had sat
They found no trace of dog or cat;
And some folks think unto this day
That burglars stole that pair away!
But the truth about the cat and dog
Is this: they ate each other up!
Now what do you really think of that!
(The old Dutch clock it told me so,
And that is how I came to know.)

Another old-timer that reminds us all of the days when we, too, "saw things," is Eugene Field's "Seein' Things," which goes as follows:

I ain't afeard uv snakes, or toads, or bugs, or
worms, or mice,
An' things 'at girls are skeered av I think
are awful nice!
I'm pretty brave, I guess; an' yet I hate
to go to bed,
For, when I'm tucked up warm an' snug an'
when my prayers are said,
Mother tells me "Happy dreams!" and takes
away the light,
An' leaves me lyin' all alone an' seein'
things at night!

Sometimes they're in the corner, sometimes
they're by the door,
Sometimes they're all a-standin' in the
middle ov the floor:
Sometimes they are a-sittin' down, sometimes
they're walkin' round
So softly an' so creepily they never make
a sound!
Sometimes they are as black as ink, an' other
times they're white—
But the color ain't no difference when you
see things at night!

Once, when I licked a feller 'at had just
moved on our street,
An' father sent me up to bed without a bite
to eat,
I woke up in the dark an' saw things
standin' in a row,
A-lookin' at me cross-eyed an' p'intin' at
me—so!
Oh, my! I wuz so skeered that time I never
slep a mite—
It's almost allz when I'm bad I see things
at night!

An' so, when other naughty boys would coax
me into sin,
I try to skwush the Tempter's voice 'at urges
me within;
An' when they're pie for supper, or cakes
'at's big an' nice,
I want to—but I do not pass my plate I'r
them things twice!
No, rather let Starvation wipe me slowly out
a' sight
Than I should keep a-livin' on an' seein'
things at night!

New York County Notes

Genesee County—Our much needed rain came just in time to save meadows and pastures. Grass along the ledge which looked as if it had been scorched before the rain, is green again. Farmers at Elba are raising money to drain their muck land. A heavy rain oftentimes damages acres of crops on the low lands. Alfalfa is ready to cut. Strawberries and early cherries are ripening.—Mrs. R. E. G.

Tioga County—Owego was one of the fifteen postoffices in the U. S. to be accorded the privilege of selling the Sesquicentennial Sullivan commemorative postage stamps. The new stamps were received at the Owego Postoffice Saturday morning and on Monday morning a record of 10,000 stamps bearing the 7-30 cancellation were sent by the first trains and on Wednesday afternoon 16,000 two cent stamps of the new issue changed ownership. More than 700 were sent by air-mail.

A man calling himself Archibald J. Harrison is now in the Ithaca jail charged with passing worthless checks to farmers for their cattle to the amount of over \$2,000. He is supposed to be the same individual who last March paid farmers in southern Nichols for cattle with false checks. Said checks were drawn on Troy, Pa., bank. He could not then be located, and no A. J. Harrison name was on their books. He was located and

arrested after quite a chase by several police and constabularies.

The cause of so many fish dying in the Oswego Creek is undetermined. Federal Inspector Philip Farnham obtained a few specimens which died in a brief time by recovery from the creek and sent them to the State Culturist in Albany to ascertain if some disease might be attacking the trout and causing them to die. The water of Oswego Creek comes principally from springs and is considered one of the best trout fishing brooks of the state. Naturally the water would be expected to be of an even temperature, but mercury (at present) says not so. On Wednesday June 19, State Game Inspector, Otis F. Swift took the temperature, at the River—82 degrees, at Main St. Bridge 70 degrees, Red Mills Bridge 74 degrees, Coles Grove 73 degrees. This marked variation in the temperature of the stream lead the Inspector to believe that the intense heat is causing the ordinarily cold waters which trout thrive in to become too warm for this breed of fish.—Mrs. D. D. B.

Columbia County—June 18 was the hottest day of the year. 90 degrees at Locust Lodge Community Hall. The Copake Wahelo 4-H Club leaves June 26 for Ithaca, for Junior Field Day. The Germantown Garden Club held a meeting recently. Dahlias were the principal

subject. No fire permits will be issued until after we have a heavy rain. The hazard is very dangerous in various parts of the county. Eight places for Health Consultations for children are to be held in the county. The first is to be at Claverack on July 1 for pre-school-age children. Shipments of county wool are to be made on June 25 from Claverack. Cherry and strawberry crops are good in many places. Eggs, 30c and strawberries 20c a quart and \$5.50 a crate.—Mrs. C. V. H.

Washington County—The town of Jackson held its annual picnic at Hedges Lake June 15. Over 300 were there and all had an enjoyable time. Farmers having clover and alfalfa are beginning to cut it. Help is scarce and wages high. Home grown strawberries are plentiful and are selling for 15 and 20c per basket. Eggs are 33 and 35c.—H. H. C.

Sullivan County—George W. Seibert was elected County Legion Commander at Monticello. Leo Tuck, 17 years old, was drowned in Sacket Lake when a canoe he and his boy friend were rowing upset. Farmers have had a wonderful week. There has been nice warm rain and it makes them all feel happy. Cows are bringing good prices, also broilers and calves. Eggs and butter are not very high. Some farmers have started haying. They all report a light crop this year.—P. E.

New York Retail Egg Grades Revised

FOR some time it has been common knowledge that there were to be changes in the New York Retail Egg Grades. Producers in the past have expressed much dissatisfaction with the effect of the Grades which finally resulted in a hearing by the State Department of Agriculture and Markets at Albany, on May 8th. At this hearing following a free discussion, announcement was made that the changes in the Grades would be made public at an early date.

A number of important changes have been made to become effective on August 5. Producers were almost unanimous in the demand that the unclassified grade be eliminated. There were also suggestions that the nearby fancy grade be omitted. The grades which go into effect August 5, include fancy grade, grade A, grade B, and grade C. It will be noticed that the fancy grade has been retained, but that the unclassified grade is no longer sanctioned.

Fresh Eggs Defined

In inspecting eggs to see whether they meet the designated grades, the Department allows a tolerance of two eggs in each grade which may fall below the requirements of the grade, except that these two eggs are required to meet the standards of the next lower grade. For example, two eggs out of a dozen labeled grade A, could fail to meet the standard without subjecting the retailer to a penalty if these two eggs could meet the standards for grade B.

Another grade concerns the use of the term "fresh." The term "fresh" may be applied in addition to the grade designation to any lot of fancy grade or grade A eggs which are free from objectionable odor and flavor and which are not over 30 days old. However, regardless of age, the term "fresh" cannot be applied to any lot of eggs which are below the requirements of grade A, neither can the term be legally applied to any lot of eggs which are over thirty days old. Where eggs have been shell treated they may be sold under any of the grades designated, but if they are sold as "fresh" eggs they must also be described as shell treated. In other words, shell treated eggs might be sold as grade A, assuming of course, that they met the requirements, but if the term "fresh" is added, then they must be labeled, "grade A," fresh, shell treated."

Inedible Eggs

At the hearing in Albany, there was some discussion over the difficulty coming from the classification of meat spots and blood clots as inedible eggs. Under the law it is illegal to sell inedible eggs even though it is commonly recognized that meat spots and blood clots do not render an egg inedible. The rules and regulations have been changed as follows: An egg containing a small clot of blood on the surface of the yolk or floating on the white if not mixed with the white, shall not, on that account, be deemed to be inedible. The same regulation applies to meat spots. However, eggs containing blood clots or meat spots cannot be sold as fancy, grade A or grade B eggs and not more than two in any dozen shall be sold as grade C eggs. This means that it is legal to sell two eggs in each dozen containing either blood clots or meat spots so long as the entire dozen is labeled grade C. The rules also state that any egg which falls below the minimum requirements for U. S. Grades shall be deemed to be inedible and unfit for human food.

Under the new regulations, the jobber is required to furnish the retailer an invoice prior to or accompanying the eggs. This invoice must give the grade according to the New York Retail Egg Grades or if the eggs have not been candled, they must be

marked, "Notice, these eggs have not been candled." If they have not been candled, the retailer must either candle them or mark them grade C, before he sells them. The invoice also must state that the eggs are cold storage or refrigerator if they have been in cold storage for a longer period than thirty days either in this state or any other state.

From the consumers point of view, the regulations are a little more specific than formerly as to the manner in which they must be marked. If they are sold in a carton they must be marked with the exact grade. If they are offered for sale in bulk there must be a sign among the eggs or close to them giving the grade or if they are delivered to the consumer in a paper bag, the grade must be marked on the bag.

There has been no change in the law so far as the producer is concerned. The producer is still able to sell his own eggs to the consumer without grading them or to sell his own eggs or any other person's eggs, to the wholesaler without grading them. There is no reason, however, why producers should not grade them and many who have studied the question believe that it would be to their advantage to grade them according to the New York State Retail Egg Grades.

How Big is a "Large" Egg?

The terms, "large, medium and small" eggs have been defined. The term "large" or any other similar term shall not be used in describing a lot of eggs unless they weigh at least 24 ounces per dozen. The minimum weight for medium-sized eggs is 20½ ounces per dozen. Any eggs weighing less than 20½ ounces per dozen may be described as "small" eggs.

There has been an immense amount of discussion during the past year on the question of Retail Egg Grades. Neither the producer nor the trade have been entirely satisfied with the way they work and as one man said, "That is a good indication that it is working fairly well." If either group were entirely satisfied it is good evidence that the grades are unfair to the other half of the business. Although the law may not be perfect we believe that these grades should be given a fair trial and that producers should use their influence in having the laws enforced. It is certainly true that conditions before the Retail Egg Grades were put into effect were far from satisfactory. If the consumer can depend on getting the grade asked for it should do much to encourage the consumption of eggs and bring about a healthy condition in the market.

Finishing the Broilers for Market

WEIGHT is a very important requirement when marketing broilers if satisfactory returns are to be obtained. The market prefers broilers weighing from 2¼ to 2½ pounds. Broilers arriving on the market under these weights always bring a low price. Special fattening of the broilers during the last two weeks will help to put on additional weight and at the same time improve the quality of the bird. The following fattening mash will give good results if fed the broilers for the last two weeks before they are shipped to market.

- 100 lbs. cornmeal
- 50 lbs. ground oatmeal
- 50 lbs. wheat middlings
- 30 lbs. meat scrap

When liquid milk is available for mixing the mash, the meat scrap can be omitted. This mash should be fed wet twice a day, giving what the birds will clean up in 20 minutes to a half hour. Give a feeding of cracked corn the last thing at night.—A.K.

Florida's Fruit Industry Menaced

(Continued from Page 7)

was placed in large containers, cooked with live steam and ground to a pulp before being buried. Experiments have been carried on in treating the infected ground with live steam, and many kinds of sprays and dusts are being utilized for experimental purposes.

Host Plants Not Grown

Zone 2 includes the area within nine miles of the limits of zone 1 on all sides and is known as the protective zone. All waste fruits or vegetables are destroyed at once, an intensive clean-up campaign is conducted, careful investigation is made to ascertain whether the infestation has spread, and no planting of host fruits or vegetables is permitted between May 1st and November 1st. Shipments of fruit or vegetables from the protective zones are permitted only under special permits and after rigid inspection has been made.

Zone 3 includes the remainder of the state, and shipments may be made from that territory to states other than those quarantined against all Florida host fruits or vegetables under Federal order. The discovery of an infestation at any point automatically converts it into a nucleus for zones 1 and 2, and the entire quarantined area of the state is divided into eight districts, with a head inspector in charge of each. In many counties which have not become infested voluntary prevention, quarantine and patrol work has been undertaken by county and municipal authorities and civic organizations at their own expense in an effort to keep those sections free of the fly. Georgia and Alabama have posted guardsmen on all highways leading across the state line to prevent the movement of bulk fruit by "fruit bootleggers," and port and railroad inspection is being maintained in both states, as well as in Florida. Although the fly has been discovered in larvae form in shipments of fruit in other states, no actual case of infestation or of the discovery of adult flies has been found at this time, and the public may with entire safety buy and use fruit which is offered for sale after governmental inspection and proper refrigerating regulations are complied with.

Producer is Hard Hit

The general public attitude in Florida is one of optimism and eagerness to cooperate with the authorities in the gigantic task at hand, regardless of the individual loss sustained, and the extent of this loss, actual and potential, will be apparent when it is noted that Florida has one-fourth of the world's plantings of citrus fruits and is the world's greatest producer of grapefruit. The grove area of the state is about 1/12 of the entire cultivated area, and the citrus industry, including packing houses and other equipment, represents an investment of \$350,000,000. When the value of truck and other fruit crops in Florida which are menaced by the presence of the fly is added to this, and when the danger to leading crops of many other states is considered, the seriousness of the situation is obvious, and the necessity for action such as that which is being taken, however drastic it may seem, cannot be denied.

The man hardest hit by the disaster is, of course, the small grower and truck farmer, who must see his entire crop sacrificed if he is within one mile of a known infestation, even though his fruit and vegetables are free of the insect. He may not plant any host vegetable again until after November 1st, if then, and his fruit trees are subject to destruction if it should be deemed necessary. He loses both his income and all produce for the use of his family. If he is in the second zone he may ship only to specified markets under permit and after intensive clean-up work and careful inspection, and his income and opportunities for realizing on his crops are necessarily curtailed.

Unfortunate as the circumstances are for this class of growers and far-

mers, as well as others affected in various ways, certain undeniable benefits are to be derived from the campaign of eradication under way. Many groves which have been neglected or only partially tended will benefit greatly by the clean-up work and subsequent attention given all groves within the two zones surrounding each infestation, and thus will be brought into fuller bearing and prolonged usefulness. Growers and farmers who have depended upon one or two crops will diversify, plant crops which are not susceptible to the fly and utilize markets hitherto neglected. Over-production will be avoided and the general price level sustained at a point enabling those who ship to do so with reasonable profit. Only graded fruit of good quality will be shipped, and culls will be utilized otherwise. Co-

operation in its fullest sense will govern the activities of growers, shippers and all others interested in the industry, to their mutual advantage.

Insect Must Be Controlled

The situation in Florida, is grave but it is by no means hopeless. At this writing infestations have been discovered or zones have been extended into parts of fourteen of Florida's sixty-seven counties, eradication work has been completed and the quarantine lifted in one sector, the question of reimbursing growers who have incurred losses by the destruction of fruits and vegetables is under consideration both in Congress and the Florida legislature, an unofficial state-wide organization of magnitude and influence is being developed for the purpose of supporting and assisting in official eradi-

cation work, and orders have been issued banning the shipment of any fruit of this season's crop from any part of Florida after June 15th, except when held under approved cold storage after that date.

The early wave of hysteria which might have been observed in some parts of the state has given way to a calm determination to utilize to the utmost every available resource in a systematic, energetic, intelligent battle against this latest insect enemy which threatens the welfare, if not the very life of important classifications of American agriculture. Whether the insect is wholly eradicated or not, it must be brought under control, regardless of the effort, expenditure and sacrifice involved, and the performance of this duty has become the task of the hour in Florida.

No trouble starting that tractor now *Socony Special Gasoline insures quick starting*

IF your tractor is hard to start, fill up the tank with Socony Special Gasoline. Socony Special is a real high-test gasoline. It insures quicker starting, greater power and fuel economy.

Not only in your tractor, but in your truck, your portable engines and all other farm machinery you'll find Socony Special does a better job.

Remember, too, that the 30,000 Socony Service Stations in New York and New England will supply you with Socony Parabase Motor Oil and Socony 990-A Motor Oil for Fords.

Farmers here have found that Socony Products in their farm machinery means smoother operation, greater protection, and longer life for their motors.

Canning for Profit

One Reader Tells How She Manages to Earn Some Pin-Money at Home

A FAMOUS old recipe for Hare Pie begins thus: "First catch your hare—" To paraphrase this, I should begin my article by saying, "First find your market."

When I first decided to sell canned fruit, I tried many well known methods of finding a market, all of which failed and I decided "There ain't no sich animal," and gave up the venture. For many years I had given a city friend Christmas gifts of fruit, vegetables, conserves, etc., and finally she rather timidly asked me if I would sell an order of these home-made dainties to her, and to a friend of hers. Needless to add, I consented. One of these ladies gave as a bridge prize a box of my jelly and conserves and lo! the elusive market arrived at my door.

My orders consist of all sorts of can-

strawberry jam, plain or combined with pineapple. Many varieties of pickles are ordered, a mixed vegetable pickle in sweetened vinegar is very popular. It is attractive, having cauliflower, tiny cucumbers, small carrots, lima beans and many other vegetables.

Meat, chicken soup stock are also canned, but there is little profit in these, unless one has the meat or chickens on the farm and wishes a market for them.

I use a pressure cooker for all canning, and glass cans. My customers either provide their own cans or pay extra for them and I offer to refund this if cans are returned in good condition.

A type written slip of my products and prices of each is sent to every customer who checks her order and returns the slip to me.

earned is rather good pay.—Mrs. E. D. DeR., N. Y.

Useful Pamphlets

The following booklets can be secured by addressing Household Department, AMERICAN AGRICULTURIST, 461 Fourth Ave., New York City.

How to Make Crepe Paper Costumes—10c.

How to Make Crepe Paper Flowers—10c. How to Decorate Halls, Booths and Automobiles—10c.

Weaving with Paper Rope—10c.

Sealing Wax Craft—10c.

Betty's Scrapbook of Recipes for Little Cooks—10c.

Fashion Catalogue—12c.

Art of Embroidery, teaching all the important stitches used in embroidery—25c.

Yarncraft—directions for making many kinds of sweaters, caps, afghans, and coolie coats, both knitted and crocheted—25c plus 5c for mailing.

Old-fashioned recipes.

Reviving in case of drowning or gas poisoning.

Learning to crochet and knit.

Knitting the new sweaters.

Free pamphlets:

Health Pamphlets for Mothers and Young Children.

Talks on sex to older children.

to boiling point then skim well and allow to boil rapidly about 15 minutes. Then remove cherries with the syrup and place on flat platters in single layers. Cover with a piece of window pane or flat glass and expose to the hot sun for 2 or 3 successive days—till syrup looks thick and cherries are clear. Seal in glasses or jars.

Pickled Cherries

Pit sour cherries, cover with vinegar and let stand 24 hours. Drain the following day, all the vinegar from them, measure cherries, and allow 1 quart of sugar to the same amount of cherries. Pack in jars in alternate layers of cherries and sugar, adding a few pieces of stick cinnamon, whole cloves and allspice. Keep covered with a plate. Stir with a fork every few days till sugar is well dissolved. Pack in jars, and allow to stand fully three weeks before using. Keep in cool place.

Roberta Symmes

Save soap scraps and put them through the meat grinder for soap flakes or add a little water and melt them on the stove for soap jelly.

* * *

Allow orange marmalade to cool slightly after cooking and stir before putting it in glasses. The peel will then remain evenly distributed instead of rising to the top.

Something Different in Tea Towels

Brownie Tea Towels

No. 303, 20c for Patterns
No. 303B, \$1.50 Stamped set

Anything that helps lighten the thrice-a-day task, is certainly worth finding, and these cunning little Brownies do their best. Here is General Brownie with a knife for a sword, Paddy Brownie with the fork, Waiter

Brownie with the plate, Cooky with the ladle and Sailor Brownie about to leap into the soup plate. Simple outline stitches soon convert them into finished treasures for the gift list, the cedar chest, or for your own kitchen.

You can have number 303 in wax transfer form, ready to stamp on your material for 20 cents; or, if you want, number 303B supplies the set of six stamped on tea toweling of excellent quality, and thread enough to embroider in the right colors for \$1.50 a set postpaid. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., N. Y. C.

ned fruit, canned vegetables, yellow bantam corn, beet greens with tiny beets, whole and sliced beets, whole and diced carrots, string beans, which I leave whole and pack neatly in cans, whole tomatoes, mixtures of vegetables for soup, and sieved pumpkin. As a special this year I packed ears of corn in two quart cans, filled cans with hot water and processed them. Some of my customers liked it very much and it looks attractive. Personally, I thought it tasted rather soaked, like fresh corn which has been left too long in water, as one sometimes gets it in restaurants.

Vegetables and canned fruits are usually ordered by pints, jams and conserves are packed in half pint jars, jellies are stored in small flat jelly glasses. For all jams and a few jellies such as cherry, berry, peach, etc. I use a commercial pectin. This adds to the expense but is quicker, surer and makes jam of better flavor. My favorites are a peach conserve which combines oranges and maraschino cherries, a fresh prune conserve and a rainbow jelly, which has various colored layers, the base being apple jelly. There is also a great demand for

Living, as I do on a fruit farm, I can always use ripe fruit. This provides a market for fruit which cannot be shipped. Sugar I buy by the hundredweight, when and where I can get it cheapest. My customers live in a nearby city and we take the fruit to them or they call for it. I have never shipped any.

It was very difficult to estimate price, but I arrived at a conclusion which seems satisfactory to all concerned. An accurate account of fruit, sugar, in fact all materials were kept, also amount of finished product. In this way I found my cost. I settled on 10c profit per can of vegetables or plain canned fruit and 15c per jar for jelly, jam and conserve. This was for my work. I estimated all fruits and vegetables at market price, thus I realize a profit on materials used. The vegetables are the surplus from our own garden and more than pay total expenses of family vegetables.

This all means work and one can see the profits are not enormous, but it is to me rather pleasant work and made a welcome addition to the family income.

The work fits in very well with my other housework. One or two afternoons a week will produce a goodly number of filled jars, as I often have a cooker on the oil stove all the morning while doing my routine work. While profits are not great, for the amount of time spent the money

Wash New Prints Carefully

THIS season's vogue for vivid prints will test the skill of the one who washes them. Even the best printed cotton or linen will suffer if handled the wrong way. Use cold or lukewarm suds, wash and rinse quickly, wrap in soft towels after wringing and dry rapidly. Hot water, strong suds, slow handling and drying either in a heap or hanging up while too wet are almost certain to bring trouble.

Every well-dressed woman will have some of the printed fabrics in her wardrobe and successful cleaning is a very necessary part of their care.

Delicious Tested Recipes

Cherry Jam

Wash and pit 1 lb. of sour cherries and add 1 pint of raspberries. To each pound of fruit add a pound of sugar. Boil slowly and steadily together till thick. Time depends on firmness of cherries—generally about half an hour is right. Pour into glasses and cover with hot paraffine.

Cherry Roll

Roll paste (flaky or puff paste is best) in a sheet about ¾ inch thick. Spread thickly with cherries. Sprinkle generously with sugar. Add cinnamon and bits of butter. Roll up and when in baking pan, sprinkle with bits of butter and pour ½ cup of fruit-juice or water over it. Bake in a rather quick oven, being sure to baste occasionally till nicely browned. Serve hot with hard sauce.

Cherry Salad

Fill cavities of pitted cherries with pecans or other nuts—blanched almonds or walnuts are equally good. Serve with mayonnaise.

Cherry Salad (No. 2)

2½ lbs. white cherries
1 lb. cream cheese
1 tablespoon heavy cream
Pinch salt
Dash of paprika

Drain cherries, pit carefully so as not to break fruit. Mash cheese till soft but not too soft, just a creamy consistency. Season with salt and paprika. Fill cherry cavities with the cheese mixture and chill. Serve cherries on crisp lettuce leaves with fruit salad dressing.

Sunshine Preserved Cherries

Select fine large cherries, wash, pit and stem with care. Allow equal weight of sugar and cherries. Place cherries in kettle, sprinkling sugar over each layer of fruit. Bring slowly

Full of Dash and Chic

2813

STYLE NO. 2813 is the last word in smartness for this season's sportswear. The jaunty jacket and the two-piece sleeveless dress make a very convenient outfit for many purposes. A white pique dress trimmed with red bows and worn with a vivid red or printed pique jacket would be ultra-smart in this season of cotton's popularity. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4 yards of 40-inch material for dress and jacket facing with 2¼ yards of 40 in. material for jacket. PATTERN PRICE 13c.

Aunt Janet's Counsel Corner

More Readers Tell Where They Would Choose to Live

DEAR Aunt Janet:

Where would I live if I were free to choose? Why right where I do live of course. At any rate I would live in the country. I could never endure the confusion and rush and scramble of city life. I like to be where I can "Lift up mine eyes unto the hills" and yet not be right among the hills.

In this particular part of New York state, the picturesque and historic section between the southern end of Lake Champlain and the Hudson River, we have all, it seems, that heart could wish.

First of all it is healthful. Then we have good land, good water, good roads and good markets. In our par-

watching a pair of brown wrens build their nest in a bird house.

Our neighbors are agreeable and pleasant and their children the kind we can trust our boy with. The children attend a one-room school near by until ready for high school in town.

There is often plenty of snow in winter, but our roads are always open for cars. And when one is dressed for the cold, how fine it is to work or walk in the clean air. It gives one a good appetite, clears the mind and helps the circulation.

A small income other than that to be earned on the farm, to take care of possible sickness, supply a few extra luxuries and allow for some travel each year, would sure make "The dearest spot on earth to me home sweet home."—Mrs. E. W., N. Y.

Letters from Betty's Friends

DEAR BETTY:

I would like to have one of those nice scrapbooks and I will send 10c in my letter.

I am 14 years old and I can bake cakes, cookies, icings for cakes, Johnny cake, and brown bread. But I haven't learned to bake white bread or pies yet. But I will pretty soon.

I belong to the 4-H Club and maybe I am going to Ithaca the 26th to 28th of June to the 4-H Field Day celebration. I belong to the potato project. Do you belong? It is lots of fun. If you don't belong, why don't you join?

You have never had a letter from me before but I hope we will be good friends, in our letters anyway. I am sending you my mother's wheat muffin recipe and I have had very good luck with it and I thought maybe you would want to try it too. So I will write it out for you.

1/4 cup of sugar
1/4 cup of shortening
3/4 cup of sour milk
3 teaspoons of baking powder
1 1/2 cups of flour
Pinch of salt

Maybe you have this recipe already, but if you haven't here it is. I hope you have good luck.—Your friend, G. L. M., Phelps, New York.

* * *

Dear Betty:

Please send me one of your scrapbooks so I can put my recipes in it that I have saved from the American Agriculturist. I can cook and make pretty nearly everything. I like your cocoa cakes, they are my favorite cakes. I will enclose 10c for the scrapbook. I read the American Agriculturist every week and enjoy it very much.

Yours truly,
G. W., New York.

P. S. I would like to have other children write to me. I would be very glad to write to them.—G. W.

Send to Betty for this Little Cook's name and address if you want to write to her as she suggests. Also send ten cents for a scrapbook which is the best way to keep all the cooking lessons in order. Address Betty, c/o American Agriculturist, 461 Fourth Ave., New York City.

Council's Summer Schools

THE New York State Council of Religious Education has announced its summer schools for the various districts of New York State. Dates and places are as follows:

Northern New York School, St. Lawrence University, Campus,
Canton, N. Y., July 15-26.

Central New York School, Cornell University, Campus,
Ithaca, N. Y., July 22-Aug. 2

Summer School for Town & County Ministers, held in connection with Cornell University,
Ithaca, N. Y., July 22-Aug. 2

Western New York School;
Silver Lake, N. Y., August 5-16

Southern New York School, Camp Sloane,

Millerton, N. Y., Aug. 24-Sept. 2

These schools are held in conjunction with the International Council of Religious Education, made up of forty different denominations.

The courses are intended to be of service to all leaders in religious work, some even being prepared for youth of senior high school age and experience. Those called the standard leadership courses represent a wide variety

Strikingly Smart

STYLE NO. 2822 with its sunburst hip-line effect and its pretty cascading jabot is charming for the dainty dress. Silk voile, georgette, chiffon or dimity would lend itself to this design most attractively. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 1/2 yards of 39-inch material with 1 1/2 yards of binding. PATTERN PRICE 13c.

TO ORDER: Write name, address, pattern sizes and numbers correctly and clearly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the new summer fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

which include: Pupil Study, Materials and Methods, and Administration courses, in the elementary and adolescent divisions, together with courses in Bible, Worship, Christian Education, Missionary Education, Educational Program of the Church, Psychology, Pedagogy, Story Telling, Pageantry, Recreational Leadership, Curriculum, Vacation Church Schools, Week Day Church Schools, and Leadership training.

Although the primary purpose of the schools is study, the fun is not omitted. For those who are interested in church work and in keeping up with the best methods of doing it, these schools will be most helpful and inspiring. Tuition varies from two and a half to four dollars. Room and board for the entire period will range from fourteen to twenty-five dollars.

Rev. Basil T. Young 80 Howard St., Albany, N. Y. is director of leadership training and can give any additional information desired about the schools.

The Plains of Abraham—By James Oliver Curwood

The sun was slanting well to the westward when they came out of the Big Forest and looked down the slope upon Jeems's home. Peace and happiness seemed to have spread their golden wings over Forbidden Valley, and as Jeems gazed upon its stillness and beauty, its never-ending lure and tranquil friendliness, his uncle's words of warning faded before the more pleasant things in his mind. Smoke was rising in a silvery spiral from the big stone chimney, and forgetting the tragic occurrences of the day, his heart throbbed with the thrill which would never grow old as he saw his mother among her flowers. He raised his eye to the face of the man beside him as if to challenge the truth of the foreboding things he had said, and he found that Hepsibah Adams was not looking at the woman or the cabin below him, but straight out over the broken roofs and pinnacles of the great forest which ended in an azure haze on the far side of Forbidden Valley.

And Odd, standing between them, was also gazing steadily beyond the green and brown opens as if in the vast distances were an unsolvable mystery which his soul was struggling to understand.

Breaking from his thought and smiling with good-humoured cheer, Hepsibah put his hand on Jeems's shoulder. A pair of culprits conscious of their duty, they descended slowly to explain to Catherine why Jeems had one closed eye and a puffed-up lip and his uncle a swollen jaw.

CHAPTER VI

ON SATURDAY, Henri Bulain and Catherine took up the regular routine of their springtime work again. This had been interrupted in several ways of late. Heavy rains at night had impeded planting and the little ploughing which remained to be done, and time had been lost in the trips to Tonteur Manor and Lussan's place. At the breakfast table, where Catherine presided with a formality which assured Hepsibah and Jeems that she had not forgiven them for the embroilments they had brought upon themselves, Henri said that Saturday was as good a day as any on which to resume his work, and Hepsibah eagerly agreed with him and offered his assistance.

That her brother, of all men, should have engaged in a common brawl with the baron of the seigneurie, whom she had planned to bring into closer intimacy with her home and family, filled Catherine's sensitive soul with a shock the effect of which it was impossible for her to conceal. She placed small credence in Hepsibah's assurance that he and Tonteur had parted the best of friends; and when Jeems declared this to be true and testified that he had seen them shake hands, lack of conviction still lay in her eyes and with it a deeper suspicion of the one whom she believed was leading Jeems astray in the telling of the truth. Hepsibah knew he was in disgrace and probably would remain so for some time, and his discomfort was increased by the fact that his head had swollen larger during the night, so that every time his sister looked at him she was reminded of the shame he had brought upon her. Yet her displeasure was less than she permitted him to believe, for she could never hold resentment long against her brother, whose genial recklessness and irresponsibility made her regard him with almost the same mothering tenderness with which she looked upon her boy.

On this day the little clearing at the edge of the valley hummed with industry. So filled with beauty and

freshness were the sky and air, so glorious was all the world about them, that Catherine rang at her tasks in spite of her wounded feelings. Her outdoor oven of clay and stones breathed fragrantly of baking things, and in one end of it, apart from her bread and cakes, was Hepsibah's favourite dish, a huge meat pie with thick upper and lower crusts between which were the choicest parts of Jeems's turkey. Her laying hens were cackling cheerfully about the barn, and to make the morning a greater success, a family

work, and always looking ahead to the day when the Bulain farm would reach far and wide on all sides of them, with two hundred acres of cleared land in it instead of thirty. There were five arpents, or seven and a half English acres, in the stump-filled field where Hepsibah and Jeems had worked, and he planned to have this cleaned and ready for the plough by another spring. Five arpents a year was what he had set for himself, which would give him more than a hundred acres in crops at the end of another

growing up about him. Forbidden Valley, treacherous in its beauty, brewing horror behind its smiling mask of peace, had conquered him, and he sensed something almost physical in its triumph.

He thought he was alone, but when he turned toward the cabin he found Jeems standing near him. The boy had come so quietly that Hepsibah's skilled ears had caught no sign of his presence, and for a moment he stared in silence at his face, illumined by the star glow. There was a strange beauty about the lad as he stood there which even the wilderness man's eyes could not fail to see, a thing more fragile than flesh and blood, something built up of a haunting vision of other years when in the empty days that had followed their mother's death he had seen that same questing, yearning light in Catherine's face that he now saw in her boy's.

It was Jeems who broke the spell by coming nearer to his side.

Then Hepsibah thrust an arm toward the submerging sea of darkness before them.

"Do you know that valley well?"

"As far as the lakes, where we go for berries and to shoot wildfowl in season," said Jeems.

"No farther?"

"A little. Hunting is nearer and easier between here and the seigneurie, but we get our candle fat there because it is a good feeding place for bears and the lakes are full of fish with which to bait our deadfalls."

"And you have seen no trails except those made by deer and bear and porcupine?"

"Yes, we have found moccasin tracks."

The flush of moonrise had grown into a flaming ball climbing over Squirrel Rock and Jeems's eyes were on it.

"I am making a trip to the lakes to-morrow," said his uncle, "and it is my intention to find what lies beyond them. Do you want to go?"

"I am going over there," said Jeems, and he nodded toward the rising moon. "I want to see Toinette and tell her I am sorry for what happened yesterday."

Hepsibah thumbed fresh tobacco upon the spark still left in the bowl of his pipe. He looked sidewise at Jeems, and in the boy's profile, so like his mother's in the soft radiance of the night, he saw a resoluteness of purpose as unimpassioned as the voice in which Jeems had answered him.

"That's a decision born o' the Adams blood, lad," he approved. "There never was a day when an Adams failed to be a gentleman in the vicissitudes of either love or war. It's a fine and inspiring thought to want to apologize to Toinette—even though you were right. I'll go with you and leave the valley for a later day."

"I'm not going to fight," said Jeems. "I'm going to see Toinette—and I want to go alone."

On Sunday morning, when he set out for Tonteur Manor, this was the thought deeply entrenched in Jeems's mind—that he would not fight Paul Tache that day no matter what temptation might be placed in his path. He had told his mother where he was going and what he was planning to do, and with her encouragement to spur him on he felt eager and hopeful as he made his way toward the seigneurie.

This feeling was unlike the one with which he had set out to fight Paul Tache, and what he had to do loomed even more important than any physical vanquishment which he might bring upon his rival. To soften Toinette's

(Continued on Page 18)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Jeems admires Toinette and is deeply hurt by her disdain. He hates Paul Tache, Toinette's cousin from Quebec, because Paul assumes a superior air and because he is in the good graces of Toinette.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache.

Paul is the victor in the fight, and Hepsibah and Tonteur also have a scrap in which Hepsibah comes in second best. Jeems starts out for home alone.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable

of chicks had come triumphantly out of their shells during the night. There was little left for Catherine to desire as she looked out over their fields. At the end of them she could see Henri and his ox turning over the rich brown soil, and not far from him, in a clearing filled with stumps, Hepsibah and Jeems were at work with grub hoes and axes. A gentler spirit of grace and indulgence filled her bosom as her eyes rested on these toiling members of her family, and when she called them to dinner she had made up her mind to forgive her brother for what he had done.

When he had washed himself and his ruddy face was before her, she put an arm about his neck and kissed his cheek.

"I am sorry I had to be cross with you," she said, and the day was brighter for Hepsibah.

In the stump field that afternoon he came in closer intercourse than ever with Jeems, and the two dug and pried and pulled together, triumphing a little at a time over the tough snags and roots, and finding breath in their labour to talk of many things filled with lively interest for the younger of the two. As Hepsibah's powerful muscles strained and sweat rolled from his face, Jeems found a new thrill in putting his own body to work, for in this toil at his uncle's side there seemed to be a greater thing than the mere act of exertion, a building up of something within him which gave him increasing satisfaction. Hepsibah talked and worked with him as if he were a man, and discoursed on so many things foreign to his life, from politics and his own adventurings to the opportunities awaiting young men along the frontiers, that Jeems's head at times had difficulty with the matters which he was struggling to absorb. Hepsibah was also discovering in his nephew qualities of comradeship and understanding which answered a yearning that had long been in him.

In the evening, when housework and chores were done, Henri and Catherine often strolled about the clearings enjoying the contemplation of achievement and pointing out to-morrow's

ten years. Neither of the two was afraid of work. Their faces glowed with the joy of an imaginative building of their little world.

"No place in New France will be more beautiful than ours at the end of that time," exclaimed Catherine. "Jeems will have a wife then, and little children to play and laugh in this paradise—and there, Hepsibah, where you see the great oaks and the two big chestnuts, is the spot we have set aside for Jeems's home."

Later, before he went to bed, Hepsibah stood smoking his pipe under a sky that was an arch of glowing stars. A great silence lay about him, a stillness made deeper by the little sounds of life which came out of it, the breathing movement and pulse which were of the earth itself, the whispering of growing things, the faint and ever-present melody of air stirring softly among seas of forest tops. He could hear the homelike sound of Henri's ox in the barn and the purling of water in the creek. Not far away, a whippoorwill swelled its throat in lonely, beautiful song, and from the edge of the distant swamp another answered it. More than all other birds of night or day Hepsibah loved the whippoorwill. Their solitariness and brooding melancholy touched a sympathetic chord somewhere in his nature, and when the humour was on him he imitated their notes so perfectly that the birds called back to him in a friendly way. But to-night he scarcely heard their cry, nor did his blood react with pleasant thrill to the beauty of the star-filled heavens with their touch of silvery flush in the east where the moon was about to thrust itself over the top of Squirrel Rock. His eyes saw only one thing, and that was the pit of darkness which hung over Forbidden Valley, and his ears were tensed even now for that which he believed would come out of it some day. He was thinking of the plans Catherine had made for the years ahead, of her dreams impossible for him to break down, of her faith and happiness which he could not darken with his warnings. He felt his failure. He knew he was powerless against all that he had seen

The Plains of Abraham

(Continued on Page 16)

heart, now so bitterly against him, to bring back the friendliness of her smile, and to see her eyes alight with the sweetness which she had been on the point of yielding to him at Lussan's place were foremost in his mind. His memory of her and of the greeting which had flashed in her face made him forget her blows and the fury of her tongue. A little at a time, it had been growing stronger in him from the moment he had washed her hat at the edge of the pool. He was anxious to see Toinette again and to offer her all that his small world held, if thereby he could make amends for the ruin and humiliation he had brought upon her. A spirit of chivalry in him, older than his years, rose above the lowly consideration of rights and wrongs. He was sure he was right. Yet he wanted to say he was wrong. Though he did not know it, years had passed since two days ago, and he was a new Jeems going to a new Toinette. His fear of her had vanished. He was no longer borne down by a feeling of littleness and unimportance, and for the first time he was visiting Tonteur Manor without the thought of inferiority sending its misgivings through his soul. In some mysterious way which he did not understand, but which he strongly felt, he had passed away from yesterday forever.

On the crest of Tonteur Hill he paused, and no knight ever looked on a lovelier kingdom than the wide domain which lay below him. Until today it had filled him with a kind of awe, and when trespassing upon it he had felt like a trivial creature treading the realm of a princess who was farther away from him than the sun. Tonteur's power and riches had frightened him. The length and breadth of his fertile acres. His fortified church and manor. The great river which he guarded for the King of France. The miles upon miles of wilderness terrain, Lake Champlain agleam in a blue haze of distance, mystery, romance, the thrill of things he had never lived or known, all forcing themselves upon him and oppressing him with a sense of his smallness.

(To be Continued Next Week)

A Debate on Farm Relief

THERE is much interest at the present time in farm relief legislation. We will be glad to send to Grange lecturers or others interested in the subject, an outline for a debate on farm relief and an outline for discussion on this important subject.

The debate outline was prepared by Mr. Benson Y. Landis of the Federal Council of Churches of Christ in America and the outline for discussion purposes is one which recently appeared in "The Inquiry." Either or both of these will be sent to anyone who asks for them and encloses 4c in stamps for postage.

Health Program

THE National Dairy Council has printed a pamphlet called "Health Programs for Rural Groups". We have a supply of these booklets on hand and will be glad to send one to any Grange lecturer, or others who are interested, upon receipt of 2c to cover postage.

The June pig survey taken by the U. S. Department of Agriculture through rural mail carriers, shows a decrease of about 8 per cent as compared with the pig crop of 1928. A decrease of 8 per cent is equivalent to about 4,300,000 pigs. The decrease in the corn belt is about 6 per cent, which indicates the smallest spring pig crop in that area since 1925.

More fall milk is needed, and to obtain this more cows must freshen in the late summer and early fall.

FISHKILL FARMS

offer the following

Yearling Bulls

FISHKILL COLANTHA PONTIAC

Born April 14, 1928

FISHKILL SIR MAY BEAUTY

Born April 28, 1928

FISHKILL PRIDE HENGVERELD

Born May 23, 1928

FISHKILL MAID HENGVERELD

Born June 6, 1928

These four fine specimens of the Holstein breed are sired by FISHKILL SIR MAY HENGVERELD DE KOL. His sire is out of JENNY LINN COLANTHA (30.95 lbs. butter in 7 days at 4 years), she being a grand-daughter of that greatest of all milk sires COLANTHA JOHANNA LAD, through his best son, our former herd sire, DUTCHLAND COLANTHA SIR INKA. On his dam's side FISHKILL SIR MAY HENGVERELD DEKOL's ancestry is just as impressive. His dam WINANA SEGIS MAY 2nd (27.42 lbs. butter in 7 days at 3 years, 11 months, 14 days), is a daughter of a full brother to that "Marvel of all Sires" KING SEGIS PONTIAC COUNT whose daughters have broken over 100 world's records.

Sons of "Dutch" Daughters

The dams of these young bulls we are offering are all daughters of the great DUTCHLAND COLANTHA SIR INKA mentioned above, making these youngsters strong in the blood of the greatest of all milk sires, COLANTHA JOHANNA LAD. Read each individual's accomplishments.

FISHKILL PONTIAC DE KOL INKA—dam of FISHKILL COLANTHA PONTIAC, made record of over 20 lbs. butter in 7 days as a 2 year old and 493.72 lbs. butter and 11,012.20 lbs. milk in 365 days at the age of 2 years, 11 months and 15 days.

FISHKILL BEAUTY INKA COLANTHA—dam of FISHKILL SIR MAY BEAUTY, at the age of 2 years, 9 months, 24 days produced 482.51 lbs. of butter and 12,861.30 lbs. milk in 305 days (Class C).

FISHKILL BESSIE PRIDE INKA—dam of FISHKILL PRIDE HENGVERELD, as a 4 year old made a record (Class B) of 810.53 lbs. butter and 17,707.50 lbs. milk in 365 days. As stated above she is a Dutch daughter out of Bessie Pride Polkadot Fayne, she having a record of 1,079.83 lbs. butter in 365 days at the age of 5½ years, and a 7 day record of 35.10 lbs. butter.

DUTCHLAND INKA COLANTHA MAID—dam of FISHKILL MAID HENGVERELD has a fine list of daughters including 18 over 30 lbs. and 2 over 1,000 lbs. One of her daughters, Fishkill Inka Lady DeKol made a 7 day record of 472 lbs. milk and 22.19 lbs. butter at 2 yrs., 11 mos. In 304 days she made a record of 11,741.8 lbs. milk and 550.25 lbs. butter at same age. This was the highest 2 year old fat record in America in 1927 and 1928.

"Buy Back" Concerns Active

Last Fall we purchased about \$72.00 worth of guinea pigs from the Philadelphia Laboratory Supply Company, and received a contract. A buy-back proposition. For myself, as well as a few others around here, this buy-back contract was a failure. Mr. Micheals, and the Laboratory Supply Company are one and the same thing. People are either informed that they have broken their contract, or else send one shipment, and then are informed that their stock was dead upon arrival. I could go more into detail, and send their contract, which is peculiar in its working.

What I would certainly like to know is "Are you familiar with this man, or the Laboratory Supply Company? If so, what have you to say in regard to him?" It seems rather unfair, the whole matter. I have raised into the hundreds of covies

from my stock purchased of him, and I cannot get a market. Others have been likewise affected.

WE HAVE received numerous inquiries from subscribers concerning the reliability of the Laboratory Supply Co. Financial reports on them were rather favorable, yet we have always maintained it is impossible for any company to live up to their guarantee to buy-back offsprings, and have steadily recommended against buying any kind of live-stock on the buy-back proposition.

Hardly Butter

THE National Better Business Bureau has just published some information on an advertisement pub-

lished by the Magic Sales Services, of Gainesville, Florida, which claims to furnish for 25c directions for making three pounds of butter from one pound. We doubt greatly whether any of our subscribers would fall for this sort of a scheme, yet we know they are interested because of the possible effect on consumption. The instructions given for 25c tell how to churn up one pound of butter, together with eggs and sweet milk, to form "three pounds of the best butter."

In the first place, it is evident that such a product cannot be called butter. Practically all the state laws require that butter must contain no less than 80% of butter fat. It is also evident that any such product must be of a decidedly inferior quality, as compared with the real product.

A Correction

SOME time ago we published an item in the Service Bureau Columns, stating that we had received no answer from Hirshaut & Bakst, of Monticello, N. Y. regarding a complaint from our subscriber that he did not receive returns for eggs. The original complaint came to us on September 14. We received a reply on September 21, in which Hirshaut & Bakst stated they were writing to our subscriber. Although our subscriber reported that the claim had not been settled, and although we wrote to Hirshaut &

Bakst several times, we received no further answer until after the item had been published in the Service Bureau Columns. We now find that this complaint was finally settled, and in fairness to Hirshaut & Bakst, we are glad to publish the facts at this time.

Changes Corporate Name

THE world famous old concern, the J. I. Case Threshing Machine Company, Inc., of Racine, Wisconsin, has just announced a change in its corporate name. Henceforth, the organization will be officially known as the J. I. Case Co., Inc. There will be no change made in the personnel or established policies of the institution.

This change in name was deemed necessary due to the fact that the Company has outgrown the name given it a great many years ago, when its principal product was threshing machines. From the very beginning, the line of products steadily expanded, until now it includes a full line of farm operating equipment, so the words "Threshing Machine" in its corporate name no longer indicates adequately the classes of product it manufactures and sells.

AMERICAN AGRICULTURIST is printed at Poughkeepsie, but our business and editorial offices are at 461 Fourth Avenue, New York City. Please direct all editorial and advertising mail to New York City. If you send it to Poughkeepsie, it will be delayed in answering.

Why be satisfied with less?

Only a few years ago, Kelly-Springfield tires cost about 15% more than other makes—and people who used them found them well worth the difference.

The Kellys of today are far better tires—easier riding, more rugged and giving much greater mileage—yet they now cost no more than the makes that never ranked with Kelly.

Since it costs no more to buy the best, why be satisfied with less?

CHEVROLET SIX-CYLINDER TRUCKS offer outstanding advantages for Farm Service

Available at the lowest price ever placed on a six-cylinder truck—and offering, in addition, numerous outstanding advantages that make it ideally suited to farm service—the new Chevrolet Utility Truck is sweeping on to tremendous popularity in the rural districts.

With its new six-cylinder valve-in-head motor, it provides a measure of all-round performance never before thought possible in a low-priced truck. Representing a power increase of 32%, and equipped with a four-speed forward transmission that gives exactly the proper power application for every need, it carries its loads easily and swiftly over hills, muddy roads and across fields. It operates with amazing smoothness and lack of vibration that give added life to the entire truck. And its

sturdy strength and dependability keep it on the job during the busy season when a day's delay means a big loss.

And never was a low-priced truck so easy to handle. It is equipped with a full ball-bearing steering mechanism. The newly-designed 4-wheel brakes are unusually powerful and easy to apply. And the instrument panel is equipped with every necessary driving convenience.

See your Chevrolet dealer today. Learn how little it costs to own and operate this modern six-cylinder truck—for not only is it sold in the price range of the four, but its operating economy is even greater than that of its famous four-cylinder predecessor!

She Heard Some one going Up the Stairs

A Bell System Advertisement

THE family of a farmer in Missouri had gone to town for a Fourth of July celebration. A daughter in another town came home unexpectedly. Entering the house, she heard some one going up the stairs. She called out. It was a burglar. Frightened, he escaped through a window. She telephoned to a neighbor who immediately called the Sheriff. The burglar was caught the next day.

A farmer near Medford, N. J., was offered 10c a pound for a carload of steers by a Philadelphia slaughterman. The farmer wanted 10½c. He telephoned a Jersey City commission man and described the cattle. He was advised they ought to bring 11c. He shipped the cattle that day and they sold for 11½c a pound. Profit by telephone, \$262.50.

The telephone often saves lives and property in case of burglary, fire, injury or sickness. It pays for itself many times over by running needed errands to town, bringing a spare part when some machine is broken, or in finding where and when to sell for the best price.

The modern farm home has a telephone.

A.A.'s Western New York Farm and Home Talk

Apple Crop Lighter

By M. C. BURRITT

DURING the last ten days in June

we have had several good showers which have relieved the critically dry situation we were in, but the ground is still dry at plowing depth. No heavy soaking rains have fallen.

M. C. Burritt

It seems to be the irony of fate to have beautiful dry hay weather just before hay is ready and thenshowery periods aftercuttingis started. "I knew that the first cutting of alfalfa would start the rain," said my neighbor, and it did. Our first two attempts to start haying each brought a rain although not enough to seriously damage the hay. The rains made it possible to start set cabbage where plants were big enough and quite a lot have been set during the past week. Plant beds are late, however, due to late sowing because of too much rain early and to lack of rain after they came up. So planting will be late again. Hot sun and drying winds between showers have been rather hard on plantings and the stands to date are none too good.

We Apply Codlin Moth Spray

The fourth, or first codlin moth, spray, was put on during the week. Riding the spray tank affords one a good look into every tree. Apples are getting of sufficient size now so that they can be readily seen. This observation confirms earlier ones that the apple crop will be much lighter than was first anticipated. Some varieties are very light. Both 20 ounce and Northern Spy are the lightest set in several years. Wealthy and Duchess

are good. Greening is only a fair crop while even Baldwin is far from a full crop—probably not over 50 per cent. Some growers report little or no fruit and very few claim a big crop. While the total yield will probably be larger than that of 1928, it new seems very doubtful if it will be 50 per cent larger as was first estimated. It will be more likely 25 to 30 per cent greater than 1928.

Corn and beans are well started and have had the first cultivation. They are generally pretty good stands except after late or poor plowing and fitting where the dry hard condition prevented good germination. It has been fairly easy to keep the weeds down this season because of the dry weather but even so there are plenty of them. Wheat has not started to ripen yet and will apparently be late. The showers saved the oat crop which was drying up for lack of moisture.

We have had an unusually fine crop of strawberries this year. Planted in mid-May of last year, the variety Premier made an excellent growth in the rainy period that followed and covered the ground in a matted row two feet wide. After cultivation all last season we mulched the rows with strawy manure when it froze up in December. This spring we have done no cultivation but early in the season again mulched heavily with strawy manure, this time between the rows. This with a once over to pull the few big weeds kept the patch clean. The yield will run more than 4,000 quarts to the acre and the size and quality of the fruits has been exceptionally good. The family has feasted on strawberries and cream or shortcake three times a day for nearly three weeks. There is one place where a farm family has privileges city families do not enjoy—June 30, 1929, Hilton, New York.

Taxpayers Appeal Rural School Improvement Society Case

THE New York State Education Law provides as follows:

"Any person conceiving himself aggrieved may appeal or petition to the Commissioner of Education who is hereby authorized and required to examine and decide the same; and the Commissioner of Education may also institute such proceedings as are authorized under this act and his decision in such appeals, petitions or proceedings shall be final and conclusive, and not subject to question or review in any place or court whatever.****"

Acting under this provision, taxpayers of Common School District No. 1, Town of Palatine, Montgomery County, recently brought an appeal from the action taken at the annual school meeting held in that district on the 7th day of May, 1929.

There were several counts brought in the appeal by taxpayers, one of which was against the following action taken by the district meeting.

"Motion made and seconded to send \$10.00 to the Rural School Improvement Society—Carried."

On this action, the Commissioner of Education ruled as follows:

"The corporation known as 'New York State Rural School Improvement Society, Inc.,' for which this contribution was intended, is a membership corporation not connected in any way with the public school system. Among the avowed purposes expressed in its certificate of incorporation are the improvement and conservation of the district schools of New York State. The fact that such purposes are expressed in its certificate does not connect the corporation with the public school system nor make such corporation a part thereof. There are many organizations not connected with

the school system that may be said to have similar civic welfare purposes.

"There is no provision of law which authorizes the electors of a school district, assembled in district meeting, to make contributions of the district's funds to such organization. The powers of the district voters participating in such meeting are limited by the provisions of the Education Law and particularly by sections 206 and 467 thereof. There is nothing in either section to authorize such contributions. Section 467 prescribes generally the purposes for which taxes may be voted and acts authorized. The final clause of subdivision 1 of said section authorizes a district meeting to vote taxes 'for such other purpose relating to the support and welfare of the school as they may, by resolution, approve.' This clause has been interpreted in a number of decisions. In *Matter of District No. 1, Town of Groton*, 37 State Dept. Repts. 200, Acting Commissioner Wiley held that this general 'welfare clause' does not permit a district to purchase land for reforestation purposes. In the *Matter of Valk*, 21 St Dept Repts 692, Commissioner Finley held that such 'welfare clause' did not authorize a district meeting to appropriate moneys for the erection of a monument and the holding of a celebration in school District No. 8, Town of Hunter, in honor of the young men of the town who served the country in the World War. Commissioner Finley said:

"The powers of a district meeting to vote taxes upon the district are prescribed and limited by statute. If the purpose is not fairly within those specified in the above quoted section (467) of the law, a tax therefor may not be voted. However worthy the purpose may be a district meeting may not exceed the

It Pays to Feed Good Cows Heavily

Getting Your Money's Worth When You Buy Concentrates

ANY manufacturing firm whose purchases of raw materials amounted to \$52,000,000 a year, would try in every possible way to save by buying for less money, by taking advantage of cash discounts, and by study to find out whether the material bought might not be used to better advantage so that it would be necessary to buy less of it.

New York State farmers, according to the last census figures, paid out \$52,000,000 for grain each year to feed their dairy cows and other live stock. If exact figures were available for 1928 the total would be considerably larger. Some dairymen undoubtedly secured better results than others. If all the dairy cows in AMERICAN AGRICULTURIST territory could in some way be fed as well as some herds are, it would result in enormous savings.

A Few Feeding Problems

In considering how the money spent for feed might return greater profits, the following questions naturally suggest themselves. Does it pay to buy grain or should the dairyman keep only the number of cows that he can grow feed for? Does it pay better to buy a ready mixed feed or to buy the ingredients and mix at home? What per cent of protein should a dairy ration contain? Does it pay to buy feed on credit?

If we assume for a moment, in discussing the first question, that all dairymen in the New York Milk Shed should raise all their feed, the first big effect of such action would be to reduce the number of cows that could be kept. This again would necessarily result in the widening of the New York Milk Shed. Eastern dairymen have an advantage in producing milk in that they are close to the market while other sections can pro-

By H. L. COSLINE

Associate Editor, American Agriculturist

duce feed more efficiently than it can be produced here. Another serious objection to the idea is the impossibility of raising a balanced ration. If dairy cattle are fed properly it is necessary to buy at least some feed in the form of by-product high protein concentrates.

Others who do not feel that all feed should be raised do recommend that a good proportion of the low protein feeds, such, for instance, as a mixture of oats and barley, should be grown and that only enough high protein concentrates to balance the mixture should be purchased. In this connection it is of interest that the Farm Management Department of the New York State College of Agriculture has found that the profit on growing grain crops in this state is very low, and that the only way of making a profit is by getting a high yield per acre.

Good Roughage Lowers Costs

In our opinion, the proper basis for growing dairy feed on the farm is as follows: Particular attention should first be given to raising an adequate supply of the best possible roughage. If cows are fed on late-cut timothy hay, it becomes necessary to buy more grain to enable them to produce heavily. Where cows have all they can eat of good alfalfa or clover hay, they will produce heavily on a smaller amount of grain. In spite of some complaints concerning the cost of filling the silo, records show that there is no crop which will produce as much feed on an acre as well grown corn silage and in our opinion, it will continue to be grown on the best dairy farms in the East.

All well organized dairy farms must practice

crop rotation and it is our belief that grain should be grown only to the extent that it is necessary in the rotation. On land that is seeded to grain, proper care should be taken to see that a high yield of the best possible quality is secured. Possibly this will mean a mixture of oats, peas and barley which not only gives a high yield, but is higher in protein than oats alone and will therefore, require the purchase of less high protein concentrates.

It Pays to Feed Good Cows

If this program of raising good roughage and grain only in the rotation is followed it pays to buy concentrates and to feed them heavily. This statement is dependent upon one qualification, namely, that the dairy should be made up of high producing individuals which are able to take the feed given them and use it for the manufacture of milk. Putting this program into practice would not reduce the total feed bill of the New York Milk Shed. It would however, result in increased production per cow as well as enabling some dairymen to increase the number of cows in the herd. This tendency would be desirable and it would not only put off the day when it will be necessary to extend the New York Milk Shed, but would result in lowering the cost of production per hundred pounds of milk and therefore, result in greater profits to the producer.

There is another angle which perhaps does not receive the consideration that it should. Every hundred pounds of grain fed on the dairy farm helps to maintain the fertility of the soil. In fact, it has been insinuated in certain quarters that the feed bill on some dairy farms pretty closely approximates the returns from milk and that

(Continued on Page 7)

Potato Growers from Many States Tour Long Island

Producers and Scientists Discuss Production and Marketing Problems

WHEN any event goes smoothly and according to schedule little comment is made. Probably few of those who attended realized the amount of work and thought required to stage an event as sizeable as the Long Island Potato Tour. Those who were responsible for the details knew in advance something of the amount of time and effort required and those who merely attended the Tour know from the smooth way in which everything moved that those responsible did their work in a wonderfully efficient manner.

The Tour this year on June 26, 27 and 28 was the Twelfth Annual Long Island Potato Tour. Many in attendance had already taken the trip several times while others were there for the first time. It was interesting to talk with those making their first trip and to get their impressions of Long Island. They were impressed first by the size of the Island. Many have the impression that it is relatively small and populated primarily by commuters and real estate operators. After traveling a hundred miles east and seeing one hundred acre potato fields visitors cannot help but get a new conception of the Island's size and agricultural importance.

At the same time, visitors are impressed by the amount of waste land on the Island. Upstate, of course, part of the farm is cultivated and the remainder is in pasture. On Long Island, pastures are few and far between. Most of the relatively few dairy cattle are staked out and a silo is a rare sight. On

thousands of Long Island farms, potatoes are the principal income-producing crop. Naturally growers are interested in every angle of the business and are continually studying to cut down costs or increase their returns. Where any crop is grown exclusively, problems arise which are not apparent where the same crop is grown as a side line.

Long Island growers have found that they cannot get first-class results from seed produced on the Island. Consequently, practically the entire crop is put in from seed imported from sections farther north. One important part of the Tour was the inspection of a number of seed source administrations where seed from Prince Edward Island, Maine, upstate New York, Vermont, Wisconsin, and North Dakota, were compared.

Long Island growers were interested in the results and so were seed growers from these va-

rious states and provinces. Many of them were in attendance to see how their seed was producing in comparison with that from other sections and to see whether anything might be done to increase the satisfaction of Long Island growers who were buying from them.

Another problem which does not bother most upstate growers is the cutting and storing of seed. Potatoes are put in on Long Island early in the season and most growers find it necessary to cut the seed somewhat in advance of planting dates. Under certain conditions it has been found that this seed does not keep well and rots after it is planted. Experiments are being conducted to determine the best methods of cutting and storing seed potatoes. Other problems which perhaps are not so new but still of great importance which were discussed on the trip, were fertilizing, spraying, cultivating and marketing.

The Tour started on Wednesday from the Mineola Court House and most of the day was spent inspecting fields in Nassau County. Dinner was served at the Massapequa Grange Hall and the Tour ended at the Farmingdale State School of Agriculture with an evening program. On Thursday morning we started from Farmingdale and went into Suffolk County, visiting the farms of a number of growers. Luncheon was served at Baiting Hollow church and after an inspection of the Long Island Vegetable Research Farm, the procession of cars proceeded to Orient Point with a number of

"There Is History Under Your Feet"

WHAT an appeal to the imagination the Sullivan-Clinton Expedition to conquer the Indians has, when we stop to consider what those bold ancestor soldiers of ours accomplished. Bear in mind that nearly all of Northern Pennsylvania and Western New York was a wilderness, mostly unknown and filled with hostile savages. Think of undertaking to march an army hundreds of miles through that wilderness and the job of keeping them supplied with food, clothing and arms. Consider the great mind of Washington who could visualize or see in his imagination that great spread of valuable country beyond the frontiers and lay out a campaign to conquer it. Consider also Washington's great vision, realizing more than other men of his time that an America stuck on the Atlantic seaboard without a background of rich lands to the west was an America that could not last.

Great credit is due to Dr. Flick, the New York State historian, and to all those other men and women who are working this summer to revive for us the story of this great expedition, the importance of which cannot be over-estimated.

We can just imagine standing with a great army of Yankee soldiers, somewhere in what is now Seneca County, a hundred and fifty years ago this summer, and thinking of what they were going to tell their friends and relatives when they got home again about the fertile lands of the West. As the boys now say, they certainly must have told their friends "an earful", for within a few months after the soldiers had returned to their homes in Pennsylvania and New England, thousands of settlers began a great migration to settle the lands conquered by Sullivan.

Don't miss Dr. Flick's article on the opposite page, and then attend at least one of the Sesqui-centennial Sullivan-Clinton Celebrations this summer.

Sitting On A Squash Throne

THE newspapers of the State have been having a lot of fun lately about the rivalry between Governor Franklin D. Roosevelt and Henry Morgenthau, Jr., publisher of AMERICAN AGRICULTURIST, over which one can grow more and better squash on his farm in Dutchess County. Mr. Morgenthau claims that Governor

Roosevelt is only a mere Governor, while he, with his thirty acres of squash, is a real King—the Squash King of America, and of the world!

"That's all right," said Governor Franklin. "I've got only five acres of squash, to be sure, but this is my first year. Just wait until I really get going—I'll make that thirty acres of Henry's look like thirty cents! And as to that king business, just give me another year or so and I'll 'squash' that, too!"

While we are on the subject, we will have to let you in on another good joke about our Publisher. Last year when we were planning the big Master Farmer banquet, we had everything arranged when Mr. Morgenthau happened to notice that there was no squash on the menu.

"What," said he, "no squash for the A. A. Master Farmer banquet when I claim to be the Squash King of America! That certainly will never do."

So squash was added to the menu.

When the time came, everything went fine, and everybody had a good time. The food especially was good, and there was plenty of it. There was only one fly in the ointment—the squash was sour. Something had gone wrong in the reign of the Squash King!

Boldt's Castle—See Cover

NO, the picture on our cover is not Bingen on the Rhine; it is Boldt's Castle in our own Thousand Islands.

Anything that Europe has in the way of beautiful scenery can be duplicated, and usually improved upon, in America, and we are proving it in our series of pictures on our covers this summer called "Beauty Spots of the East". Boldt's Castle is pointed out to all tourists who take the boat rides through the Thousand Islands. It is near Alexandria Bay, and it is said that it cost a million dollars to build it. The castle is beautiful to look at, but like most castles, to us anyway, it appears cold and formidable, and not much like a comfortable home.

Oat Hulling Machines

EVERY farmer knows that one of the best farm feeds is oats. But the trouble is, for most farm animals, and particularly for poultry and hogs, the hulls are a great handicap.

Now along comes a small oat hulling machine at prices reasonable enough so that any small town feed mill should be able to have one. These machines do a practically perfect job of hulling at a rate of fifty to a hundred bushels per hour. Feed men should be able to do custom work with these oat hulling machines for the farmers at five cents a bushel, and make a nice profit.

Strawberries and Blackberries at the Same Time

ONE day early in May this year we were passing a New York City vegetable market and stopped to count the different products that one store had on exhibit for sale at the same time. Space will not allow us to give them all here, but to mention just a few, there were old potatoes, new potatoes, two or three different kinds of cabbage, cauliflower, lettuce, peas, asparagus, radishes, sweet corn, tomatoes, cucumbers, spinach, artichokes, celery, egg plant, water cress, carrots, onions, parsnips, string beans, and several others. Among the fruits there were four kinds of fresh berries, including strawberries, red raspberries, black raspberries and blackberries. There were cantaloupes, water melons, cherries, apples, pears, oranges, grape fruit, and others.

As we gazed at this great variety of fresh fruits and vegetables, we could not help but recall our longings as a boy for the different "seasons" to come along. For example, what farm boy, fond of sweet corn, has not visited the garden dozens of times before it gets ripe, hoping against hope that it will be big enough to cook. Remem-

ber what a big event it is on the farm when you dig the first new potatoes, and think of finding strawberries and blackberries on the same market stand at the same time.

Nothing impresses one so much as a sight like this with the way times have changed in a few short years. There is no longer any "season" in the market. The season for most products is now nearly the year around. Rapid transportation and refrigeration have opened up our markets to the world. When our local strawberries get ripe, we find the consumer's appetite already dulled or sated with strawberries from other sections which have been on the market for months. So with other products. All of which complicates the problem of marketing, and makes it all the more necessary for us to know and understand the markets, and to give the consumer what he wants, when he wants it, and in the way he wants it.

More and more there is going to be only one way for any farmer to hold his markets, and that is by having something that is just as good or a little better than his competitor, and by packing that high quality product in a neat and attractive package.

There are one or two good points to be said about this change in our markets, one of which is that people are certainly eating more fruit and vegetables than ever before, and another is that there are getting to be more consumers all of the time.

Farm Bureau Membership Growing

FARM Bureaus of New York State have a right to be proud of the fact that the membership in the Bureaus is steadily growing; 33,472 members have already paid their dues for 1929. This is an increase of more than three thousand over the total for 1928. Thirty-eight counties have more members this year than they had last.

This is just another indication of recognition on the part of farmers themselves of the splendid work that the Farm Bureaus are doing for agriculture.

Reading for Everybody

"Never in my life have I ever destroyed a farm paper, or any religious paper, or any good magazine, but all are passed on to friends and neighbors. How well I remember how starved I was for years, for good reading."—MRS. D.B.

THERE was a long time in American life when it was extremely difficult to get good books or magazines. That time is past and it does not seem to us that there is now any excuse for people who really want to read to be without the right kind of reading.

Eastman's Chestnut

"GRANDPA," says Johnny, climbing up on his knee. "What do you do with your long white whiskers?"

"Why, child," said Grandpa, "I do not do anything with them. I just let them alone."

"But, Grandpa," insisted Johnny, "you must do something with them. Where do you put them when you go to bed?"

"I tell you, boy," said the old man, a little testily, "I do nothing. I just let them alone."

"But, Grandpa, you do not understand me. When you go to sleep, what do you do with your whiskers? Do you put them outside of the covers, or inside of the covers, or do you put them into your pajama pocket?"

The old man put the boy down. "Run away," he said. "I do not do anything with my whiskers!"

But that night, he could not go to sleep. He did not know what to do with his whiskers. He put them on the outside of the covers; that was no good. Then he put them inside; still he was uncomfortable. Then he tried tucking the ends into his pajama pocket, and that did not work.

Finally, in a rage, he got up and cut them off!

Saving New York for America

The Story of the Great Sullivan-Clinton Expedition

TO all those who love history the 150th celebration of the Sullivan-Clinton Expedition this summer should have a great appeal. It should be especially interesting to readers of AMERICAN AGRICULTURIST, thousands of whom live on the very trails over which the soldiers marched. As Dr. Bates, the Indian expert at Cornell, often says, there is history under your feet.

History should be of interest to everybody because on its turn your own fate was determined. For example, many of your ancestors settled in New York after the soldiers in the Sullivan expedition had returned and told of the wonderful country they had marched over. Imagine what those farmer soldiers of Massachusetts used to toiling amid the stones of their own cornfields, must have thought when they saw those beautiful lands of Western New York, rich and fertile and without a stone in sight.

The greatest result of the Sullivan expedition was not the conquering of the Indians; it was the rapid migration of the settlers from New England, Pennsylvania and New Jersey into the then western lands following the expedition. George Washington, who planned the whole campaign, in his wisdom foresaw this and realized that America never would succeed with just a little grip on the Atlantic seaboard for the western lands also had to be conquered, and the Sullivan expedition made this possible.

Another outstanding characteristic of the Sullivan campaign was the resourcefulness of the soldiers and their leaders. Think of the forethought and planning that led to the damming of Otsego Lake so as to raise the Susquehanna River and make it deep enough to float the boats of the expedition! Think of all that tremendous undertaking, mostly through an unknown wilderness, and of the comparatively little loss of men or property that resulted to the Americans. The results certainly showed the wisdom of Washington and of all the generals and soldiers who actually participated.

It was one of the most romantic and far-reaching campaigns in all history and therefore well worthy of the big celebrations which are to be devoted to it this summer. Study the map on this page

and you will get some idea of the tremendous magnitude of the undertaking. Notice also the list of celebrations which we are printing in this issue.

The very interesting article which follows is furnished through the courtesy of Dr. A. C. Flick, New York State historian, who has been the chief leader in planning the Sesquicentennial Sullivan-Clinton Celebrations this summer, and in helping us to live again in the deeds of the old-timers.—THE EDITORS.

THE Sullivan-Clinton Campaign in 1779 against the hostile Iroquois Indians and the British fortresses at

forces at Saratoga, in 1777, brought temporary relief from the menace but no complete security. During the year 1778 the pillaging raids and attacks by Indians and Loyalists in the borderland were more numerous and more disastrous than before. Consequently the appeals of the menaced patriots to Governor George Clinton, to the New York Legislature, to Washington and to Congress for protection became piteously insistent. The attacks on Wyoming July 3d, and on Cherry Valley on November 11-12, 1778, opened the eyes of the civil and military au-

the "Indian expedition" was completed and laid before Congress, and that body on February 25, 1779, authorized it, and a few months later voted \$600,000 for its execution—a sum that was increased later by over \$300,000. Owing to his rank, the leadership of the campaign was offered by Washington to General Gates. When he curtly refused the honor, General John Sullivan was appointed. He was well qualified by age, temperament and military experience to carry out the hazardous undertaking. General James Clinton, the brother of Governor George Clinton, was regarded as second in command, and was given direct charge of the army which was assembled in New York and which was to march from the Mohawk Valley southward to form a juncture with General Sullivan at Tioga Point in northern Pennsylvania. General Clinton was also authorized to open the campaign with a preliminary drive from the Mohawk into the country of the Onondagas.

The Sullivan-Clinton Expedition is commonly regarded as a punitive movement against the hostile tribes of the Six Nations. It was that, to be sure, and much more. The immediate purpose was to give protection to the defenseless frontier settlements. This was to be accomplished by destroying the Indian villages and sources of food supply, and by driving the Indians westward and northward. A second object was to cut off the food supply of corn and dried vegetables which had been going from the Indians to the Loyalists and British for waging the war. A third part of the plan was to capture the strong forts at Oswego and Niagara which were storehouses of the enemy and bases for military operations. But the most important objective has been entirely overlooked by most historians. By

11, Wednesday	Honeoye	28, Saturday	Elmira
12, Thursday	Conesus Inlet	28, Saturday	Newtown Battlefield

Oswego and Niagara was the result of frontier conditions in New York and Pennsylvania which had been growing more and more acute during the years 1777 and 1778. The warriors of the Six Nations, who had formed an alliance with the English and the Loyalists, terrorized the frontier settlements. As a result there was a persistent demand for adequate protection from the exposed communities.

The precipitous retreat of St. Leger's army and the defeat of Burgoyne, which resulted in the surrender of his

thorities to the necessity of organizing a drive into the Indian country which would crush the power of the red men. The correspondence of Washington shows that he devoted a great deal of attention to the "Indian expedition" during the winter and spring of 1778-79. On March 13, 1779, the Legislature of New York ordered 1,000 men to be recruited to defend the frontier, and forts to be erected. The "spirited exertions" of New York were commended by Congress.

Meanwhile Washington's plan for

The heavy red line shows the main expedition from Tioga to Genesee Castle and return, General Sullivan's route from Easton to Tioga and General Clinton's route from Canajoharie to Tioga. The lighter red line shows Colonel Van Schaick's expedition from Fort Stanwix against the Onondagas, Colonel Brodhead's expedition from Fort Pitt to Buck Tooth, Major Parr's and Colonel Smith's excursions to Kershong, Colonel Butler's route up the east shore of Cayuga Lake, Colonel Dearborn's journey up the west shore of Cayuga Lake and Colonel Van Cortlandt's march to Painted Post. The dotted red line shows the routes taken to assemble and disperse the troops. The red line with dashes shows the parts of the campaign which were planned but not carried out.

A UNADILLA will save your corn

Make the most out of your corn crop by storing it in a Unadilla. If your corn reaches maturity—ensile it in a Unadilla. If it doesn't mature, if it freezes or becomes infected with corn borers, ensile it in a Unadilla—a sure death to this pest—a safe and sure insurance on your crops.

Unadilla ensiled corn is the best winter milk producing feed. It is succulent and highly economical. Don't wait! Order your Unadilla now and be sure of your crops. We guarantee immediate shipment on any size silo in Oregon Fir or Spruce. Absolutely dry, best quality materials obtainable. Liberal discount for cash on delivery. Time payments if wanted. Write for free catalog and prices.

Saving New York for America

(Continued from Page 5)

1779 it was pretty clearly seen that the war was deadlocked—and that was virtually a triumph for the American cause. Burgoyne had surrendered an army. France was an active ally. Other European nations were friendly. Talk of peace was not far off, and, indeed, was openly talked in the British Parliament. Washington and other leaders saw that independence with a mere fringe of land along the seacoast would scarcely be worth the cost of the struggle if the rest of the continent to the westward and northward remained in the hands of the motherland. Washington knew by actual experience that potential wealth of the fertile regions of the interior of the continent. He realized that when the time came to discuss terms of peace that rich area could be secured for the young nation only if it were in possession of the Americans. The conquest of western New York, the capture of Oswego and Niagara and the seizure of posts farther west would assure American possession at the end of the war. Hence in the Sullivan-Clinton Expedition an inland empire was the stakes for which Washington was playing—and not merely the punishment of dusky foes on our border.

Four Different Campaigns

The plan of the Sullivan-Clinton Campaign, as organized by Washington, consisted of four parts:

1. The campaign was to be opened in the spring of 1779 by General Clinton with an expedition from the upper Mohawk river and Fort Schuyler into the Onondaga country. The purpose of this movement was to free the main line of attack from the possibility of menace by the more easterly tribes of the Six Nations, and thus permit the leaders of the expedition to devote all their attention to the Cayugas and Senecas.

2. After this preliminary drive General Clinton was to mobilize an army at Canajoharie on the Mohawk and then proceed across New York State southwestward, destroying Indian villages and corn fields as he followed the upper Susquehanna river, down to Tioga Point, where he was to form a union with the army of General Sullivan.

3. Meanwhile Colonel Daniel Brodhead from Fort Pitt in western Pennsylvania was to ascend the Allegheny river to its headwaters, subduing the Indians and burning their homes as he penetrated their country. He was instructed to keep in touch with General Sullivan and to cross western New York to join him somewhere in the Seneca region.

4. The main artery of the expedition under General Sullivan was to start from Easton, Pa., with the major force, proceed across Pennsylvania to Tioga Point, and, after a juncture with General Clinton's army, move up into the Cayuga and Seneca territory. After the power of the Cayugas and Senecas had been broken, the British and Loyalists with them had been defeated, and Colonel Brodhead's reinforcements had arrived, it was hoped that the forts at Oswego and Niagara might be captured.

Thus it will be seen that the Sullivan-Clinton Campaign was one of the largest offensive movements in the whole War of Independence. It directly involved the two states of New York and Pennsylvania. Upon its success depended the future of the American Nation. Officers and soldiers from at least five states—New York, Pennsylvania, New Jersey, New Hampshire and Massachusetts—participated. Experienced Continentals and not militia were employed to carry it out. A list of the higher officers will show the importance attached to the expedition by Washington—Generals Sullivan, Clinton, Hand, Poor and Maxwell; and Colonels Brodhead, Van Schaick, Butler, Cilly, Dayton, Dearborn, Proctor, Gansevoort, Van Cortlandt, Willett, Ogden, Shreeve, Spencer, Reid, Hubley, Weissenfels, Dubois and Antis. The appropriation by Congress of near-

ly a million dollars for equipment and supplies reveals the significance attached by that body to the enterprise.

The Sullivan-Clinton Expedition against the Six Nations and their British and Loyalist leaders captured the imagination of the Americans. It awakened tremendous interest and was the theme of conversation all along the Atlantic seaboard. The newspapers of the day discussed it at great length. The novelty and uniqueness of this campaign against the red men in the wilderness with the strange sights and new experiences produced one result which did not characterize any other movement in the Revolution to so great a degree. Officers and chaplains and privates kept diaries and journals of the happenings. More than thirty of these personal observations have survived and most of them have been printed. Although few letters written by men on the expedition have survived—it may be that owing to conditions few were written—yet these diaries and journals give us today a remarkable picture of the occurrences.

A brief survey of each one of the four parts of the campaign mentioned above will enable one to visualize what took place and to see how successfully, for the most part, the expedition was carried out.

The Drive Against the Onondagas

For the preliminary drive against the Onondagas in the early spring of 1779 General Clinton ordered troops from the Schoharie and Mohawk valleys to proceed to Fort Schuyler, where Colonel Goose Van Schaick's First New York Regiment and a company of artillery were stationed. There groups of Oneidas and Tuscarawas came to the fort and asked to be permitted to join the expedition. On April 18th the Indians accompanied by American officers—Lieutenant McClellan and Ensign Hardenburg with two sergeants—set off on an independent movement. The next day, April 19th, Colonel Van Schaick, Lieutenant Colonel Willett and Major Cochran with 558 men and officers set out down Wood creek and across Lake Oneida. The army then marched across land to Onondaga lake and up Onondaga creek, where the Onondaga Indian villages were located. One account states that between 30 and 40 houses were burned; 15 Indians killed; 34 captured; one white man taken; the cows, horses and hogs which could not be taken away killed; provisions destroyed; "2 stands of colors," 100 guns, a swivel, and ammunition taken or destroyed; and a large quantity of pillage obtained. Without a single man killed or wounded, the army with the prisoners and as much plunder as could be carried was back at the boats on Lake Oneida on April 22d. Two days later they were at Fort Schuyler. A difficult incursion had been made with extraordinary expedition and with great success. Congress publicly thanked Colonel Van Schaick, his officers and men for "their activity and good conduct." This enterprise made excellent publicity for strengthening the morale for the other parts of the expedition.

Raised Water on Susquehanna

General Clinton's movement from the Mohawk to Tioga Point with about 1,600 men was quite as successful. From Albany he gave orders for the various military units to rendezvous at Canajoharie. About 250 flat-bottomed boats were built at Schenectady and taken up the river to the same place. Provisions were collected in boxes and barrels not only for his own army but for that of General Sullivan as well. During the latter part of June and early July the boats and provisions were carried over the hills by wagons from Canajoharie to the head of Lake Otsego and then taken by water to the foot of the lake where the troops assembled. The lake was dammed so as to raise the water sufficiently to float the boats down to Tioga Point. After a delay of more than a month at the foot of Lake

DAIRYMAN

It Pays To Feed Good Cows Heavily

(Continued from Page 3)

about all the profit coming from the herd is the manure which can be put back on the field. It is true, however, that the man who owns a high-producing herd of dairy cows and a naturally fertile farm and who buys and feeds concentrates heavily, does not have the problem of maintaining fertility that the crop or vegetable grower must meet.

If we grant that it does pay to feed good cows heavily and that it is not the best business policy to attempt to raise all the feed on the farm, the dairyman still has several problems to meet. One problem is the old question, "Does it pay best to buy a ready-mixed ration or to mix at home?"

Without question there has been a tendency for the best dairymen to buy more ready-mixed feed. It is true there must be some reason for it. Some of the arguments in favor of home mixing, which by the way are not used to the extent that they once were, is that it enables the dairyman to know exactly what goes into the feed, that it teaches him more about the science of feeding and that it saves him money by eliminating the costs of the mixed feed manufacturer. At the present time it seems a fair statement to say that reliable dairy feed manufacturers can put together a better mixture than dairymen can make themselves.

Mixing Costs Being Reduced

The man who mixes feed at home is matching his hand labor against the most efficient machinery which is used by the dairy feed manufacturer. If the dairyman has nothing else to do with his time, he can get some return for mixing feed at home. On a dairy farm which is organized on the most efficient basis, we believe that there is serious question as to whether better returns for the time cannot be secured by using it in some other way.

The statement has been made time and time again that the dairyman can buy ingredients and mix his own ration cheaper than he can buy a ready-mixed feed because the feed manufacturer spends such a large amount of money in advertising his product, which cost must be added to the price which he gets from the dairyman. History has shown that advertising not only pays the manufacturer but that eventually it results in lower prices to the consumer. A big volume of business enables costs to be cut all along the line. Raw materials are bought in large quantities and the manufacturing process in any established line is done almost entirely by machinery. As a result, we are approaching the stage where a ready-mixed feed can be sold for a price as low as a man can buy ingredients and mix them himself.

In the meantime, it is up to every dairyman to look the situation squarely in the face and decide whether under these conditions it will pay best to mix at home or buy a reliable trade-marked feed. We have no doubt but that it does pay many dairymen to mix at home, but in our opinion there has been a steady trend away from this practice and we see no reason why this trend will not continue.

There is still the problem of what feed to buy. By this we do not mean the particular trade name, but rather the analysis or protein content. The first thing to consider is the kind of roughage that is fed. Rations for dairy cows cannot be considered in terms of concentrates alone. Where legume hay is fed as a roughage, it is unnecessary to buy a feed with as much protein as will be required where Timothy hay is the roughage. For

example, where clover or alfalfa hay is fed, a grain mixture with from fourteen to eighteen per cent of protein will give excellent results, while a grain mixture to be fed with timothy hay should contain from twenty-two to twenty-five per cent of protein.

Fibre Content Important

Another point which should be considered in buying the ration is the total amount of digestible nutrients per hundred pounds and also the per cent of fibre, which is closely associated with digestibility. For example, the statement has sometimes been made that alfalfa hay is equal in feeding value to wheat bran. Whereas the analysis is somewhat similar, wheat bran contains 9.5 per cent of fibre and alfalfa hay contains 28.3 per cent. In other words, although the composition is somewhat similar, wheat bran is a concentrate and alfalfa hay is a roughage. The dairy feed with a low fibre content will in the long run, give better results than one high in fibre. Roughage has its place, but it can be grown more economically on the farm rather than buy it in bags.

Another question which frequently

comes up, is the desirability of buying feeds in advance in anticipation of a rise in price. In one sense it might be stated that the man who does this is a speculator and not a dairyman and that the proper thing to do is to buy feed when it is needed and pay the market price for it. On the other hand, it is considered advisable to watch the market when selling and it would seem that there is no good reason why the same advice would not be equally good in buying. In other words, it would seem good business to anticipate one's needs for feed and to get all the information possible as to the probable trend in prices and then buy at what appears to be the most favorable time. The dairyman will not always win. Sometimes the feed may drop in price later, but over a period of years this practice should result in some savings over the practice of buying only as feed is needed.

Buy for Cash and Demand a Discount

What is probably more important so far as savings are concerned is to buy for cash rather than to buy on credit. Actual figures secured by the

New York State College show that the cost of credit extended to feed buyers is more than double the cost of credit secured at the bank. In some instances dairymen have held that the same price is charged whether they pay cash or get credit, therefore, there is no incentive to buy for cash. The answer in this case is that the buyer should insist on a cash discount and if it is not given should deal with someone who will give this discount.

In other cases, dairymen report that they cannot secure bank credit but that they can secure credit from dealers. This situation may be harder to correct, but in most cases if the dairyman is on a business basis he will be able to secure credit sufficient for his needs if he will make out a credit statement, take it to his banker and talk over his problems with him. Fifty-two million dollars, which the Census states New York farmers paid for feed in 1925, is a lot of money. Probably the feed bill now is still larger. The solution as we see it, is not to spend less for feed, but to study the problem in order to buy as economically as possible and then to feed the good producer heavily and at the same time to weed out the boarders.

The Powerful New McCormick-Deering 15-30

THE POWER in the new 15-30 McCormick-Deering is the symbol of profit farming on a comfortable, efficient scale. With this powerful perfected tractor special opportunities lie ahead of you. Its owner is equipped to rise above the old cramped style of farming—to take full advantage of man-power, acreage, crop, and season—to cut to the bone the production costs that eat profit away—and to build for future expansion.

This is a McCormick-Deering tractor. So you may be positive that its liberal power is matched by new improvements and refinements all along the line. The 4-cylinder power plant, clutch, transmission and differential assemblies, built into a rigid 1-piece main frame, give great reserve strength. All important wearing parts run in a bath of oil. Ball and roller bearings at 34 points add to easy running and long life.

Considering ample power, flexibility, long life, economy, price, service, and easy operation with the equipment which is as important as the tractor itself—here is the tractor of tractors. Ask the dealer about the new 15-30 McCormick-Deering. Other McCormick-Deering Tractors—the 10-20 and the all-purpose Farmall. Catalogs on request.

INTERNATIONAL HARVESTER COMPANY

606 So. Michigan Ave. of America
(Incorporated)

Chicago, Ill.

A Little Story of Power Farming

This picture is drawn from a photograph of W. A. Asmussen, of Agar, S. D., riding his new 15-30 McCormick-Deering tractor. Mr. Asmussen is farming 1700 acres of land with the same crew (himself and two men) with which he farmed 600 acres three years ago using 18 horses. Now he has the 15-30 and a Farmall and modern power farming equipment. Note the special lamp mounted on the fender, permitting night work in rush seasons. He says he hasn't had a horse hitched up this year. They handle the 1700 acres easier and have more leisure than on the smaller acreage.

McCORMICK-DEERING

Reviewing the Latest Eastern Markets

Milk

The following are the July prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		1.95
2A Fluid Cream	2.16	
2B Cond. Milk		
Soft Cheese	2.41	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95

4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%.

The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Sharply Lower; Later Recovers Firmness

CREAMERY	July 5, 1929	June 28, 1929	July 6, 1928
SALTED			
Higher than extra	43 -43½	44 -44½	45½-46
Extra (92c)	42½-	-43½	45 -
U-91 score	39 -42	39½-43	41 -44½
Lower G'ds	38 -38½	38 -39	40 -40½

The butter market has been through a hectic week. As June came to a close and July opened prices went on the skids. The pressure which we reported last week gradually developed a sensitiveness in the market that became strong enough to influence buyers to withhold anything but the acquisition of the immediate trade needs. The weakness carried prices down a cent and a half. However, the break seemed to clear the atmosphere for on July 3rd the market was in much better shape. Some speculative interest was in evidence and on the whole, the feeling of pressure was eliminated. As the week comes to a close the firmness of the market is increasing. Buyers have bid up a half cent on most of the useful grades.

We are storing a tremendous amount of butter. The first week in July will undoubtedly mark the heaviest storage period of the season. We are very close

to 10,000,000 pounds over last year's storage figures which is bound to have some effect on the price columns. The first three days in July saw over a million and a half pounds of butter going into the warehouses.

Western Cheese Unsettling New York Market

	July 5, 1929	June 29, 1929	July 6, 1928
STATE FLATS			
Fresh Fancy	23½-25	24 -25½	25½-26½
Fresh Av'ge			
Held Fancy	27½-29½	27½-29½	29 -32
Held Av'ge			

On June 29, Western cheese markets showed a decline. At that time New York State flats, fresh and grading fancy to special, were bringing from 25c to 25½c. The situation in the West was reflected on our market this week, some operators offering Daisies and Young Americas for prompt shipment below local quotations. The situation did not fully develop until just before July 4 when the weakness in the West became quite pronounced in its influence on Eastern products. One car of State flats represented as fancy was offered at 23½c with closer selections at 24c and 25c. The week closes with the market in a very uncertain and unsettled condition. Wisconsin cheese is being offered at lower prices, which means that there is less activity in fresh State flats. The trend seems to be easier, much of course depending on which way Wisconsin goes.

Fancy Eggs Sharply Higher

NEARBY WHITE	July 5, 1929	June 29, 1929	July 6, 1928
Hennery			
Selected Extras	40 -43	38 -41	37 -39
Average Extras	39 -	37 -37½	36 -37
Extra Firsts	35½-38	34½-35½	33 -35
Firsts	33 -34½	33 -33½	31½-32
Undergrades	31 -32	31 -32	30 -31
Pullets			
Pewees			
NEARBY BROWNS			
Hennery	36 -42	34 -40	36 -37
Gathered	32 -35	31 -33½	34 -35

The egg market has steadily mounted since our last report. Just before the July 4 holiday there was a better distributive demand due to the holiday and at the same time there appeared to be a slight decrease in supplies. Advances from the West have been firmer and there is a good speculative demand. The condition continued up to yesterday, July 5, with choicest lines bringing from 40c to 43c with a 2c premium being paid for pet marks.

Brown eggs have shown a greater proportional improvement. Fancy browns are actually scarce and wanted. However, on the morning of the 5th there was quite a shortage of nearby whites caused undoubtedly by the failure to ship from many sections on the holiday, Thursday. Heavier supplies are looked for late today and there is some uncertainty whether or not there will be a worthwhile clearance, which leaves the market up in the air as far as the trend for next week is concerned.

Good Live Poultry Market After Holiday

	July 5, 1929	June 28, 1929	July 6, 1928
FOWLS			
Colored	-32	-32	26-27
Leghorn	-30	-30	23-25
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	33-46	32-48	34-45
Leghorn	25-34	25-33	26-35
CAPONS			
TURKEYS	25-35	25-35	
DUCKS, Nearby	20-25	20-25	20-24
GESE	16-17	16-17	

The live poultry market, as a whole, is a shade better than it was previous to the 4th both on fowls and broilers. On the 3rd the weather was cool and the wholesalers had no trouble holding the market at 32c for fowls. The express market, however, was unable to realize any premium and poor Leghorns moved very sluggishly. There was not an over-supply of express broilers, and with a good demand trade ruled very satisfactory with the better birds being held at top prices or close to them.

On the fifth there was a more limited supply of express fowls and the market was in much better shape, sales occasionally exceeding quotations given

above. Furthermore, express broilers came in rather sparingly and with an active demand the market ruled firm. The bulk of the broilers sold at top price and receivers were occasionally obtaining a premium for the cream of the arrivals. The market looks good for several days, much depending on the bulk of the arrivals on the 8th.

Feeds and Grains

FUTURES	July 5, 1929	Last Year
(At Chicago)		
Wheat (Sept.)	1.27½	1.36½
Corn (Sept.)	.95½	1.01
Oats (Sept.)	.46½	.43½
CASH GRAINS		
(At New York)		
Wheat, No. 2 Red	1.49½	1.42½
Corn, No. 2	1.12½	1.09½
Oats, No. 2	.60½	.56½
FEEDS		
(At Buffalo)		
Gr'd Oats	33.00	32.00
Sp'g Bran	27.50	26.50
H'd Bran	30.00	28.50
Stand'd Mids.	28.50	27.00
Soft W. Mids.	34.00	33.50
Flour Mids.	32.00	31.00
Red Dog	34.50	34.00
Wh. Hominy	39.50	38.00
Yel. Hominy	39.50	38.00
Corn Meal	42.00	40.00
Gluten Feed	38.50	38.50
Gluten Meal	46.50	46.50
36% C. S. Meal	40.00	39.00
41% C. S. Meal	43.00	42.00
43% C. S. Meal	45.00	44.00
34% O. P. Linseed Meal	51.00	50.00

The above quotations, taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Trend of the Farm Markets

(Special to American Agriculturist from the Bureau of Agricultural Economics Market News Service of the U. S. Department of Agriculture.)

GRAIN—Reports of deterioration in the spring wheat crop, particularly in Canada, together with smaller threshing returns of winter wheat than expected earlier in the season, were principally responsible for the firmer tone which developed in the wheat market during the week ending June 29. Prices advanced in most domestic markets, but the upturn was more marked at Winnipeg. The corn market was firm, influenced principally by unfavorable crop conditions in the eastern part of the Corn Belt.

FEEDS AND HAY—The feed market became somewhat firmer during the week, principally as the result of improved demand. Market stocks of old hay are the lowest of recent years, with supplies of alfalfa and prairie practically exhausted and only moderate quantities of timothy still available for shipments.

POTATOES—Potato markets were showing exceptional strength during the week ending June 29, in spite of the increase of car-lot movement. Total shipments of new stock the week before were 5,400 cars, compared with 6,545 during the same period in 1928. Prices were continually advancing on the Eastern Shore of Virginia and a range of \$3.80-\$3.90 prevailed by June 29. All eastern Cobblers sold within a jobbing range of \$3.50-\$4.85 in terminal markets.

BUTTER AND CHEESE—Butter markets were in a fairly steady position at the opening of the last week of June, but as the week progressed trade activity slumped. A nervous undertone appeared and, with supplies tending to accumulate, prices showed a slight, but general, decline at all markets. Following this decline there was evidence of some slight gain in confidence and at the close of the month the market situation was again regarded as steady. Trade, however, has not shown much improvement and supplies previously accumulated have not moved with entire satisfaction. Heavy storing continues at all market centers, and it is pointed out that the increase in storage holdings this June has considerably exceeded the increase a year ago. Production is heavier than a year ago, continuing the trend seen during the past few months. The cheese market was steady to firm on fresh styles at New York and Boston. An increasing feeling of uneasiness preceded the 1½-cent decline on Wisconsin primary markets on June 28.

EGGS—Egg receipts are a little heavier than last year and this has had some influence on the speculative demand for storage. Into-storage movement has increased considerably. Quality has been running better than might have been ex-

pected following the hot spell of the previous week.

LIVESTOCK—Livestock receipts at 11 large markets during the last week of June showed increases over those of the preceding week, with the exception of lambs. The two-way trend continued in the Chicago cattle market, good and choice fed steers and yearlings closing strong to 25 cents higher for the week, while lower grades of steers and yearlings lost 25 to 50 cents. The extreme top on fed steers was \$15.65, on yearlings \$15.50, mixed yearlings \$15.25, and heifer yearlings \$14.85. The market for grain fed steers, weighing 1,200 pounds upward was rather active, while buyers were ignoring grassy and short-fed light yearlings and the season's initial consignment of grassy native steers. Stocker and feeder cattle showed declines despite light supplies.

Hog prices at Chicago fluctuated moderately, with a top of \$11 for averages around 190 pounds. Quality of receipts showed little change from the preceding week, the comparatively cheap supplies of corn being reflected in numerous loads of well-finished butchers.

Lighter receipts failed to sustain fat lamb prices, which showed a net decline of around 50 cents for the week. The light supplies of range lambs are due to the backward spring and relatively low prices. Supplies from native territory were only moderate.

WOOL—A slight improvement in the demand for wool from manufacturers is reported from Boston. Medium grades continued firm, but the finer grades of strictly combing fleece and Territory wools sold at slightly lower prices. Fleece wools were in very moderate demand.

Potato Growers from Many States Tour Long Island

(Continued from Page 3)

stops enroute, then returning to the Sound Avenue Grange Hall for supper. Later, there was an evening program at the Grange Hall.

A partial list of those who spoke at various points on the Tour will give an idea of the importance of the Tour in the minds of those concerned with the growing of potatoes. The New York State College of Agriculture was represented by Professors E. L. Worthen, E. V. Hardenburg, C. R. Crosby, M. F. Barrus and J. R. Livermore. Dr. Parrott of the New York State Experiment Station was present as well as the entire staff of the Vegetable Research Farm at Baiting Hollow where talks were given by Dr. Clayton and Dr. H. C. Hockett. There were a number present from Washington, D. C. including W. H. Warner of the National Soil Improvement Committee and Dr. Hoagland of the U. S. Department of Agriculture, who explained a series of fertilizer experiments conducted near Orient Point. Professor E. L. Nixom of the Pennsylvania State College of Agriculture, who is well known for his activities in the Pennsylvania 400 Bushel Potato Club was present, and gave several talks on spraying. Growers were present from several seed producing sections. Western New York was ably represented by Seymour Bridge of Arkport, Steuben County and L. H. Woodward, County Farm Bureau Agent of Wyoming County. Professor H. L. Bailey of Vermont, spoke briefly on inspection methods in Vermont and similar talks were given by growers from Prince Edward Island and Maine.

The weather man treated us a little better than he has in former years. The first two days of the trip were ideal, and the Tour had broken up before rain came on Saturday, which rain, by the way was welcomed with enthusiasm.

The potato crop was in need of rain. It was the impression of the writer that the fields in Suffolk County looked slightly better on the average than they did in Nassau County. Although the vines are not quite as large as they were at this time last year, it would seem that conditions are favorable for an excellent crop, providing, of course, that the needed rain arrives in sufficient quantities.

Farm News from New York

Chilean and European Fertilizer Companies Arrive at Understanding--County Notes

A SPECIAL cable from Chile, South America, to the New York Times on July 1, stated that an agreement had been reached between a group of experts sent by the Chilean Government to Europe and the principal European producers of artificial or synthetic fertilizers.

Due to the increase in the manufacture of nitrates from the air, it appears that there has been some concern on the part of producers of Chilean nitrate, concerning the future of their industry. Although details of the agreement reached were not available, it is understood that the fundamental principle is an all-around drop in prices and an agreement that information put out by both industries will in the future be impartial so far as the use of Chilean nitrate or the

Northern New York on the following day, with arrival at Ithaca scheduled for that evening. Saturday, the last day of the tour, will be devoted to inspection of livestock experiments at Cornell University.

Agricultural Society Wants Former Presidents' Pictures

THE New York State Agricultural Society is planning to complete a collection of photographs of the presidents of the Society as a part of their exhibit at the Syracuse State Fair. Up to date they have been unsuccessful in obtaining photographs of a number of former presidents and would greatly appreciate information as to where the missing photographs may be secured.

Any information or photographs should be sent direct to Charles H. Baldwin, Secretary of the New York State Agricultural Society, 122 State Street, Albany, N. Y. The following are the names, addresses and the year they were president of former presidents on which pictures have not yet been secured.

LeRoy deChaumont, LeRaysville, Pa.	1832-33
Jesse Buel, Albany, N. Y.	1834-35

of great importance, and that it will prevent the use of fruit names on beverages composed of artificial products.

Grange Lecturers to Meet at Penn State

GRANGE lecturers from New York, New Jersey, Pennsylvania, Maryland, Delaware, and Virginia will meet at the Pennsylvania State College for their third annual conference, August 12 to 15.

State lecturers with whom reservations for the conference are being made are: Miss Elizabeth L. Arthur, Lowville, N. Y.; Walter H. Whiton, Neshaanic, N. J.; T. Bailey Thomas, Wyoming, Del.; Mrs. T. Roy Brooks, Bel Air, Md.; J. V. Nichols, Purcellville, Va., and Howard G. Eissman, East Springfield, Pa.

President Hoover Appoints Federal Farm Board

PRESIDENT HOOVER has already appointed several members of the new Federal Farm Board. Alexander H. Legge has given up a salary of \$100,000 as President of the International Harvester Company to become Chairman of the new Federal Farm Board. Other members of the Board who have accepted, are James C. Stone of Louisville Kentucky, President of the Burley Tobacco Growers Association; C. B. Denman of Farmington, Missouri, President of the National Livestock Producers Association of Chicago; Carl Williams of Oklahoma City, Okla. editor of the Oklahoma Farmer-Stockman; Charles C. Teague, Santa Paula, California, President of the California Fruit Growers' Cooperative.

A. B. Moscrip of the Twin City Dairy Cooperative Association of Saint Paul, Minn. was asked to serve on the Board but has declined to accept the candidacy. With Mr. Moscrip's declination the problem of completing the Board becomes increasingly difficult.

The six members who have been appointed will meet on July 15 with Alexander Lake acting as chairman. It is said that the Farm Board will probably be held in the Old Southern Railway Building which has been taken over by the government.

According to the New York Times, "the selection of the three remaining members of the board is causing the administration some concern. Men who are desired because of their admitted familiarity with cooperative systems and the farm problem have declined because of their private interests, and the drafting of additional 'new patriots' is not meeting with the hopes of the administration."

Pennsylvania Notes

Weather is rather cool. Ground has dried off very fast. Most of corn planted and coming up well. Some still plowing for corn. Oats are not so good but there are some good pieces of wheat. New meadows are looking good but old ones are bad. Plowing for buckwheat. The roads are being fixed where they were washed out by the recent heavy rains. Eggs 28c, butter 45c, potatoes 75c a bushel, sheep are being sheared. A few cows are being sold.—J.F.S.

Crawford County—Nearly two weeks of fine weather and now a few days of rain. Corn is growing fast. Meadows are growing up fast. Most of the wheat looks good. There is quite a call for local beef cattle. Lambs are 5 to 7 dollars a head, wool 35c, eggs 30 to 32c, butter 45 to 48c, dressed chicken 40c, strawberries 10 to 15c a quart. Pastures are good and there is a large flow of milk.—J. F. S.

Mercer County—Ideal growing weather after a belated and backward spring. The much-needed rain came this week and crops are looking more favorable. Strawberries are quite good and are selling from 15 to 25c a quart. Eggs are 28c. There will be a garden party at the Children's Home at Mercer. Fruit will be scarce this year and there are good prospects for berries.—H. J. R.

Agricultural Programs From WGY

12:00 Noon—Eastern Standard Time, daily except Saturday and Sunday—weather report, farm produce report, farm talks. Readings from the poets of the farm and home by E. R. Eastman.

6:10 P. M.—Eastern Standard Time, daily except Saturday and Sunday—farm produce report.

7:00 P. M.—Eastern Standard Time, (8:00 P. M. Daylight Saving Time). Thursday—Half-hour agricultural program.

artificial product is concerned. The agreement involves several firms, including the Imperial Chemical Industries of Great Britain, I. G. Farbenindustrie of Germany, besides some Norwegian producers and possibly a French company.

North American producers of artificial fertilizers were not included in this agreement, although it is expected that a considerable amount of synthetic fertilizers will be produced here in the future.

May Investigate Power Mergers

IN last week's issue we told of several recent mergers among the power companies in New York State. Since the story was published, Governor Roosevelt has asked Attorney General Hamilton Ward of Buffalo, to investigate the proposed \$500,000,000 merger of practically all upstate corporations.

The Attorney General indicated that he will be able to submit a preliminary report to the Governor within two weeks. In requesting this action by the Attorney General, Governor Roosevelt said that the matter was of vital importance not only to big users of electricity but also to millions of householders.

Auto Trip to Canada on Livestock Program

PENNSYLVANIA livestock farmers will convene at Buffalo, N. Y., Monday, August 12, for their annual auto tour. Inspection of the Buffalo stock yards, a visit to Niagara Falls, and a trip to a livestock farm in Ontario will constitute the program for Tuesday, August 13. On the following day the Keystone farmers will visit livestock farms in the province, arriving at Guelph, the home of the Ontario Agricultural College, that evening.

Thursday forenoon the tourists will visit the agricultural experiment station at Guelph and will then take a sight-seeing trip to Toronto. In the afternoon the touring farmers will reach the St. Lawrence river so that an evening trip can be taken through the Thousand Islands.

Livestock farms will be visited in

Genesee County—Ten new members have enrolled in the Genesee County Dairy Improvement Association. The Association has 26 herds with one official tester who tests the milk, weighs it and weighs the feed and grain used, thus finding the profit from each cow. Of 560 cows 176 were on the honor roll. A. Silvernail owned the best cow for butterfat and E. H. Waite owned the highest producer, a cow named "Mary" producing 1970 pounds of milk during the month. The recent rain started crops growing and everything is looking fine again. A number of farmers are cutting clover and alfalfa but showers are delaying them getting it up. A number of bathers received a lightning shock which swept Horseshoe Lake last week. Some were knocked unconscious. Apple orchards at Pavilion, New York, were severely damaged by the heavy wind and hail storm which struck there June 21. Seventy members of the Genesee County 4-H Club with their leaders left on a special train to Ithaca, June 26 to attend the 8th annual Junior Field Day.—Mrs. R.E.G.

We had a good rain last night and we needed it badly for the ground dries out very quickly. Farmers could not plow for corn today because of the weather. The acreage to spring crops is light this spring. There is a light crop of cherries. Wheat looks fairly good but the weather has been too dry for crops to do well. Millers are paying \$1.10 for wheat and \$7 to \$10 per ton for hay. Butter is 50c a pound, eggs 30 to 35c a dozen and fowls, dressed, 22 to 26c.—J. C.

Steuben County—After a couple of weeks of hot sultry weather it is again cooler. All crops especially potatoes are late. At least 1-3 of the tillable land is idle as farmers cannot afford to hire help. Cows are very high at \$150. Apples, pears, plums and cherries are nearly a failure.—C. H. E.

Orange County—June 19, a hailstorm over the western part of the county did tens of thousands of dollars damage, centering around the black dirt region near Pine Island, and destroyed fine crops of onions and lettuce which were counted on to lift their owners out of the debt accumulated in the last three years of ruined crops. Plenty of rain the last week in June following two weeks of

hot dry weather. Prospects are fine for good berry crops. Judge Russell Wiggins, Middletown, is unanimously nominated by the Republican Co. Committee for supreme court judge in New York.—D. C. H.

Sullivan County—The first graduation was held in the new South Fallsburg High School. Daniel McNamee, Supreme Court Justice, will hold court the first Saturday in July at Kingston. The weather is very catchy and farmers are having a hard time trying to hay. Corn looks very good and potatoes are considered in a fair state. Gardens are very late. Eggs bring 36c a dozen but there is not a very healthy supply as hens are not laying as well as earlier in the season. Pastures look fine and cows are keeping up on their milk productions.

Oswego County—We have been having quite a long hot spell. There was a nice rain on the 25 and another on the 28. A good many cabbage were set during the week. Some are haying. Most hay is light. Corn is looking well but is late. Oats are good. There are not many potatoes up yet and there is not much fruit. There is a large acreage of truck crops, lettuce and onions. One man has 22 acres of string beans. Two carloads of spinach were shipped the week of the 19. Fulton is the largest shipping center of truck crops in the United States. The berry crop is almost over and the berries are small. A large barn on the Senator Strenahan farm recently burned when full of oats. The cause is unknown.—J. S. M.

Warren County—If man will only cooperate with nature and climatic conditions, crops cannot help but grow. Practically all crops were late in planting but the splendid growing condition, has, I believe, brought everything up to date, except in a few places where there was a light frost June 8. Oats, corn and potatoes are looking fine. Hay prospects are not especially good. Heat, electric storms and potato bugs are abundant. There is some damage from lightning in some districts. Butter 55c and scarce, eggs 40c. Pastures are red with wild strawberries. Gardens are looking well. I am writing this during a shower, and as the R. F. D. mailman remarked, "It rains without effort and without excuse."—E. G.

New York County Notes

Mid-Summer Trends in Fashion

Hot Days Call for Sheer Fabrics and Comfortable Designs

WARM summer days suggest the sheerest of fabrics and sleeveless styles which are cool and comfortable. The shows are featuring dresses of this type for midsummer in cotton and silk pique, shantung, silk crepes, crepe-de-Chine, printed silks, linen and printed cottons. Many of the sleeveless dresses the younger miss are made one-piece with narrow belts of matching material and matching or harmonizing jackets.

Fullness in the skirt is arranged in flat pleats to retain the slender silhouette. Some dresses are cut with

less dress with inverted pleats at each side of front and center front with pleated ruffle trim, blue pipings, and blue buttons decorating the front of the little frock. The accompanying coat was a cotton print in an all-over pattern in soft blues and lavenders.

And speaking of coats, they are made long or short. The long coats are shown for the very young. For misses and matrons the short coat with its matching dress, known in the shops as a jacket dress, is favored.

Serviceable day-time clothes are shown in prints and polka-dotted pat-

terns for hot weather. It is the most economical to wear since it does not fade and it cleans and tubs well. Pastel shades are good with special emphasis given to yellow, egg shell, beige, apricot, orange and sun-tan shades.

In trimmings, sun-tan collars and cuffs and lingerie touches are good. Many sport style dresses show monograms, pearl buttons and buckle trims that are simple and attractive.

The styles illustrated, show many of the fashion trends for midsummer. The matron at the extreme left, is becomingly dressed in a beige georgette suit which also comes in navy. The dress is a two-piece style with skirt fullness arranged in box pleats. The over-blouse features a vest of self-material, stitched belt and smart lingerie touches in the little lace bows at front and wrist. The accompanying coat shows an interesting cape collar which is especially becoming to the type of woman who is rather tall. Worn with this suit is a close fitting hat of beige crocheted straw, sun-tan hosiery and dark brown kid shoes.

Dimity Is Cool and Lovely

Miss Ten-year-old, at her right, wears a white sleeveless dimity dress with invert pleats and pleated ruffle trims down center front which is piped in yellow. Yellow buttons also decorate the front of the little frock and fasten the belt. The accompanying coat is of cotton print in bright yellow on a white ground. The new vagabond pique hat is of yellow pique.

Flesh color crepe fashions the sleeveless sport dress, illustrated at center. The skirt fullness is arranged in invert pleats at each side of the front. Neck and armholes are self-trimmed. Monogram is embroidered in matching color.

The serviceable silk suit, illustrated second from the right, consists of a tan dot on a red background. The dress is a one-piece sleeveless style with fine pleatings inserted at the sides of the skirt. Neck line and armholes are bound with self-material. Belt is made rather wide at hips and ties at center front to give a snug hipline. The short jacket is cut Tuxedo style and is untrimmed with the exception of the bow of self-material which is tied to the left side at the neck line.

The afternoon dress, illustrated above at right, is made of fuschia colored georgette crepe. The skirt consists of three tiered ruffles which are arranged to give a low hem-line at back. Sun-tan lace trims the V-shaped neck line. Belt of self-material is tied in bow at center

front. Matching strips of material are fastened to the shoulders and tie in a bow at the back. Worn with sun-tan hosiery and shoes of purple kid or shantung, the frock appears dressy and quite lovely.—Leonore Dunningan.

French Bertha Collar

STYLE NO. 2818 with its French bertha collar is very graceful and becoming for the small or slender figure. The rippling skirt and collar especially lend themselves to the softness of sheer crepes, voiles or chiffon. It cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2 3/4 yards of 39-inch material with 3/4 yard of 39-inch light contrasting, with 1/4 yard of 39-inch material for tie, belt and bow. PATTERN PRICE 13c.

Left to Right: Georgette Frock with Cape-collar Coat; Child's Sleeveless Dress of White Dimity with Coat of Cotton Print and Vagabond Hat of Pique; Sleeveless Sport Dress of Flesh-colored Crepe, with Embroidered Monogram; Silk Suit with Sleeveless Dress and Short Jacket; Afternoon Dress of Georgette Crepe.

moderately low necks in the back and are known as sun-back dresses. The accompanying jacket makes it possible to wear them on the street.

The vogue for sun-tan has made popular the new shades of off-white, egg shell and light and deep shades of beige. The influence is shown in sweaters, bathing suits and cotton clothes for misses and children.

Practically all of the wash frocks are sleeveless and are cut out at the neck to allow for a sun-tan. Slips with sun backs are made to be worn with these dresses. The necks are finished with hand-rolled hems or hem-stitched. The lower part carries a double hem so they are not transparent.

Jackets are made of plain and printed piques, gingham, printed silks, velveteen, quilted silk and shantung.

One of the most attractive ensembles I saw for a tiny miss was a white batiste dress, self-trimmed with tuckings and pleatings and worn with a red and white checked gingham coat.

The entire ensemble cost \$2.95. For wee tots nothing is smarter or more practical because they are good looking and they tub well.

Children's dresses of batiste, voile, linen and sheer cottons show accompanying coats in gingham, pique, linen and other printed cottons. Worn with these little dresses are pique hats in Vagabond style. The crowns are cut in five sections and the brims are of moderate size, made double of pique and machine stitched. The hats are washable and for that reason are quite practical. They come in all pastel shades so that it is possible to purchase hats to match the ensemble. Some show chin straps which help to hold them in place. They match the pastel pique coats and they are charming worn with striped plain and cross-barred dimity dresses, trimmed with hand-smocking or decorated with tiny ruffles on collar, sleeves and pockets.

Swisses and voiles are especially popular for the younger set. They come in lovely yellows, apricots, dull orange and sun-tan shades. One suit I particularly liked was a white dimity sleeve-

terns. The dots range in size from the very large to the tiny pin dots. They are trimmed with pleats, tucks and bows of self-material. Jackets are matching and are made without linings.

Most printed frocks are made rather feminine in style with draperies, flounces, fine pleatings, pipings, contrasting bands and bow trims. For dressier wear printed and flowered chiffons and georgettes, voiles, organdies and Celanese fabrics are extremely popular. The important style features about them are that they are made dressy, longer and with uneven hem lines. Many are sleeveless with accompanying jackets which make them suitable for daytime wear.

Sheer dresses are trimmed with hand-rolled hems and tucks to give to them the fine finish which marks these dresses made of such exquisite fabrics.

Sheer suits are supplementing the light weight cloth suits and heavier silk suits of early spring. They are shown in georgette and light weight crepes.

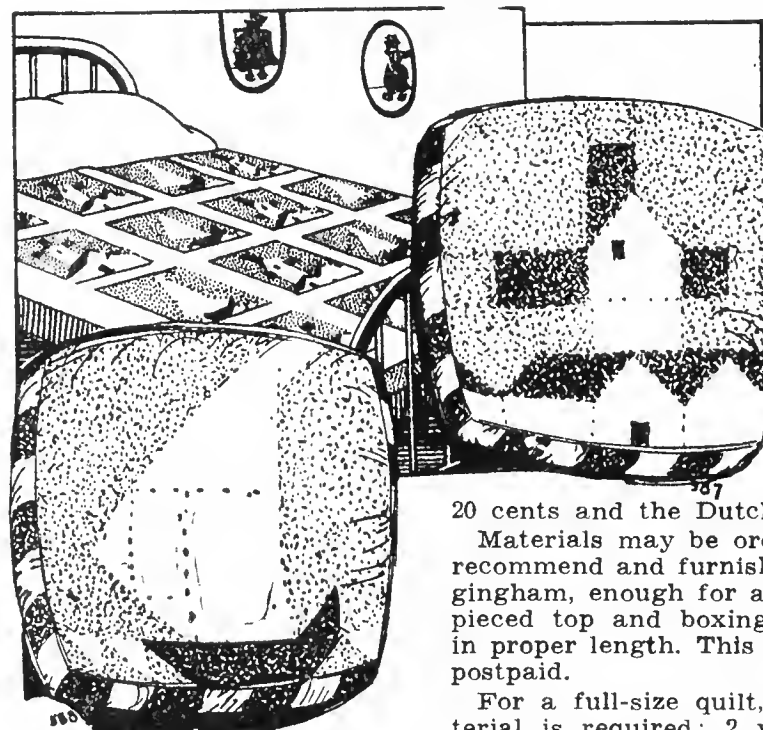

The shops feature dressy afternoon frocks with matching coats made with cape collars or Tuxedo styles or with regulation collars to match. Some consist of a two-piece dress with matching jacket or cape. They come in navy, tan, blues lighter than navy and all of the pastel shades. They are comfortable for very warm days and especially nice since they have an accompanying coat which makes them suitable for so many occasions.

Sun-Tan Shades Are Popular

Silk and georgette suits show jackets with cape collars or separate capes or long coats with cape collars. The capes and cape collars are especially nice if they are becoming. The taller girl wears them very well but the short girl will do better to stick to small narrow collars that will not detract from her height. Of course, there are certain fitted cape collar styles which look well on the smaller girl.

White is perhaps the loveliest of all

Dutch Designs for Quilts or Pillows

This time we are offering patchwork patterns that are most unique, either for prim little pillows, twin-bed quilts—one of boats and one of mills, or used alternately in one large quilt as sketched.

Colors are sky-blue, delft blue and white. Cardboard cutting patterns of each part, and instructions and chart for setting them together are included in each order. The Dutch Mill design is number 587 for

20 cents and the Dutch boat is No. 588 at 20 cents.

Materials may be ordered also, and as always we recommend and furnish first quality only. Peter Pan gingham, enough for a pillow, includes a blue back, pieced top and boxing as shown, the three colors in proper length. This is number 589 and is 40 cents postpaid.

For a full-size quilt, 80 by 84, the following material is required: 2 yards of white, 2 1/4 yards of dark blue and 1 3/4 yards of light blue, set together as shown. This allows for 16 pieced blocks, 4 inches each of lattice strips and borders, all complete. This is number 590 and costs \$3.60 postpaid. You can order the patterns separately at 20 cents. Send order to Embroidery Dept., American Agriculturist, 461 Fourth Ave., New York City.

Cooling Drinks

Comfort in Summertime Depends Much on Type of Food Consumed

JUICE left from canning fruits or from making sauce can be combined to make delicious and refreshing drinks these hot days. If there is no juice left over, it might be worth cooking up some fruit to get the necessary juice. Our appetite naturally calls for cooling beverages and in this part of the country where fruits and berries abound, there is no reason to deny ourselves that simple and wholesome pleasure. Cherries, strawberries, currants, raspberries, blackberries, grapes, or even rhubarb will provide the base for a summer beverage. The grocery store will supply an even greater range with pineapple, oranges, lemons, limes, ginger ale, and other carbonated beverages. Somebody has discovered that a good tart jelly such as cranberry or currant, makes an excellent drink when water is added. And in this dairy section it would be a pity to overlook the fact that milk makes not only a delicious but a very nourishing drink, whether used plain or combined with fruit juices or chocolate.

The attractive color given by the red fruits and berries appeals to the eye and a little experimenting with free use of one's "taster" will develop delicious combinations of flavor.

One common fault is to get the drink too sweet. It is better to add too little sugar or syrup at first and then add more if necessary. In using rather insipid berries or fruits, lemon or orange juice should be added to liven it up. A whole berry or piece of fruit or a sprig of mint in each glass will catch the eye before the nose or the palate get their innings.

Here are some recipes which will make many hot days more bearable:

Spiced Tea

Put tea in an earthen pot and pour boiling water over it allowing one teaspoonful of tea to each cup of water. Sweeten to taste usually allowing one teaspoonful of sugar to each teaspoonful of tea. In the bottom of a heavy pitcher put whole cloves allowing two cloves to each cupful of liquid. Pour the hot tea over them, chill as quickly as possible and serve with a bit of cracked ice in each cup and a slice of lemon on the side.—L. M. T.

Sour Cherry Cordial

Simmer one cup sugar and one cup water to make a syrup, add two cups tea, one cup orange juice and one-half cup lime juice. Press one No. 2 can red pitted cherries through a sieve or run through a food chopper. Add both cherry pulp and juice. Just before serving add one quart of ginger ale. Makes about three quarts.

Coffee Punch

Mix one cup strong coffee, one cup orange juice, juice from two No. 2 cans grapefruit and one cup maple syrup together and chill. Just before serving add one quart of ginger ale and two cups heavy cream if desired. It may be omitted. Makes not quite three quarts.

Pineapple Milk Shake

Shake the following ingredients together in a glass jar or shaker: One-half cup canned chocolate syrup, one cup evaporated milk or fresh cream, one cup pineapple syrup, one cup water and cracked ice.

Pruneade

Boil one-third cup sugar with two cups water for five minutes, then cool. Add juice of eight limes (or five lemons) one cup of pineapple syrup, one cup prune juice and three cups cold water. Serve very cold in punch glasses. This makes twelve to fifteen glasses.

Currant and Raspberry Shrub

Boil one-third cup currant jelly, two cups water and one-third cup sugar until jelly melts. Cool and add juice of two lemons and contents of a No. 2

can of raspberries, pressed through a sieve. Chill, add two cups carbonated water and serve at once.

Saving New York for America

(Continued from Page 6)

Otsego, General Clinton with the Third, Fourth and Fifth New York Regiments, the Sixth Massachusetts Regiment, the Fourth Pennsylvania Regiment, and four companies of Morgan's Rifles received orders from General Sullivan to start south. Hence on August 9, 1779, the dam was cut, the boats with their heavy loads of supplies were floated down the Sus-

Simple Sports Dress

STYLE NO. 2841 with its faintly suggested sleeves and kick pleats is fine for sports wear. Tub silk, linen, gingham or pique would be very suitable. The pattern cuts in sizes 16, 18, 20, 22, 24, 26, 28, 30, 32, 34, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2 3/4 yards of 36 or 39-inch material with 3/4 yard of 20-inch light and 1/2 yd. of 39-inch contrasting. Pattern price 13c.

TO ORDER: Write name, address, pattern sizes and numbers correctly and clearly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the summer fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

quehanna, and the impatient army started for Tioga. Contrary to expectations, few Indians were encountered on the journey. A number of deserted Indian towns were destroyed together with their gardens and corn fields. On August 19th General Clinton met General Poor, who had been sent forward to meet him, and on August 22d General Clinton's army was welcomed at Tioga Point with cheers and salvos of artillery. The movement had been executed quickly and without serious mishap.

Expedition from Fort Pitt

Meanwhile Colonel Daniel Brodhead following instructions had left Fort Pitt on August 11th with 605 "rank and file" to invade the Seneca country and to form a juncture with General Sullivan and General Clinton at some point in the Genesee region. He took one month's provision, which was forwarded by boat up the Allegheny river. With live stock and pack horses, and accompanied by Delaware Indians as spies and scouts, Colonel Brodhead

took his army over a shorter route northward by land. No fighting occurred on the route except a skirmish with a band of 30 or 40 Indian warriors. The Indian villages on the upper Allegheny river were deserted by the inhabitants just before the arrival of American troops. A large amount of plunder was secured and then the houses were burned and about 500 acres of corn and vegetables were destroyed. From the indefinite records it is difficult to determine the farthest point reached by Colonel Brodhead's expedition but it seems very probable that the present border line between New York and Pennsylvania was crossed. Both General Sullivan and Colonel Brodhead sent messengers to the other but apparently they did not get through in time to be of service in effecting a union. Brodhead's scouts sent to Sullivan did not return until Brodhead had returned to Fort Pitt. In this state of uncertainty, and many of his men being "barefooted and naked," Colonel Brodhead returned over a different route, destroying more Indian villages as he proceeded, and reached Fort Pitt on September 14th without loss of either "man or beast."

The major force of the expedition was mobilized at Easton, Pa. To that point marched troops from New England, New Jersey, New York and Pennsylvania. After his appointment as head of the expedition early in March 1779, General Sullivan devoted his time to make preparations for the enterprise. Food supplies had to be assembled to supplement those of General Clinton. The exact route had to be determined. Cattle and horses had to be collected. Boats had to be obtained or built. A road had to be cut over the mountain to Wyoming. On May 7th General Sullivan reached Easton, where he assembled about 3,500 men in three brigades under General Maxwell, General Hand and General Poor. On June 18th General Sullivan moved towards Wyoming, which was reached on June 23d. He had expected to be met there by a fleet of boats laden with supplies but was deeply disappointed. Hence he was delayed at Wyoming over five weeks while boats and supplies were with much difficulty obtained. It was not until July 31st that the expedition was ready to proceed, and Tioga was reached August 11th. After the juncture with General Clinton's army on August 22d, no time was lost in proceeding forward along the main line of attack.

The Battle of Newtown

After rearranging the brigades so as to place regiments under their customary commanders as nearly as could be done, and transferring the supplies from the boats to the 1,200 pack horses, the army, delayed one day by rain, started from Tioga on August 26th. The Battle of Newtown occurred near the present city of Elmira on August 29th. It was dramatic but the fatalities on both sides were not large. The Indians and Loyalists were driven from the field and pursued for some distance. The red men were frightened by the cannon which they called "thunder trees." This victory practically settled the fighting of the whole campaign, for the Indians never made another stand.

From Newtown the army hurried forward through what is now Horseheads and Montour Falls, along the eastern shore of Seneca lake to Geneva, and thence through Canandaigua and Honeyoye to old Genesee Castle, the western extremity of the expedition, which was reached on September 14th, less than three weeks after leaving Tioga. The ambush of Boyd and Parker and their companions was the only engagement after Newtown resembling a skirmish. On September 17th, feeling that his orders had been executed, General Sullivan began his return journey over the same route. On the way back parties were sent down two

sides of Cayuga lake, and Colonel Gansevoort with a body of troops cut across to Fort Stanwix. On September 30th the expedition reached Tioga.

With the exception of the capture of the forts at Oswego and Niagara the objectives of the Sullivan-Clinton Campaign were all realized. The hostile Senecas and Cayugas were terribly punished. Their homes were burned, their vast cornfields and gardens were all destroyed, and their orchards were cut down or killed. Food supplies upon which the British depended were now unavailable. The frontier settlements of New York and Pennsylvania felt secure. But the most important result was that now when peace was signed the Americans would have a pretext for holding these western lands into which within a few years thousands of settlers were to find new homes.

Considering the magnitude and importance of the expedition, it seems highly appropriate that its Sesqui-centennial should be observed this year by the Federal government and the states directly involved. New York has voted \$70,000 for observances which will be held at Elmira, Geneva, and Genesee. The whole route will be marked with appropriate monuments. Pennsylvania will have a series of observances of her own. New York and Pennsylvania will hold joint commemorations to which New Jersey, New Hampshire and Massachusetts will be invited. The Federal Government has been requested to issue a commemorative postage stamp.

The Plains of Abraham—By James Oliver Curwood

Now it was different. It was as if he had been on a long journey and had returned in every way an equal of those who lived in the valley of the Richelieu. With Odd, he sat for a time on the hill-top gazing upon the proud glory of the seigneurie. A strange fantasy grew in his brain. He saw himself fighting, as his uncle had predicted he would fight, and as Tonteur had fought to make himself a powerful lord of the land. Ambition clutched tightly at his heart. He was seeing a world larger than he had ever conceived a world could be, and everywhere in it was Toinette. For her he would make himself what her father was—a great man!

But first he must tell her he was sorry. This had ceased to be a duty. It was the flame behind his newly awakened consciousness, an act which had raised itself to the level of a crusade filled with possibilities which set his imagination aglow.

He was about to descend the winding path when a horseman rode across the bottom lands and started up the narrow trail. It was Tonteur. Concealed in a thicket Jeems watched him pass and wondered why he was riding in the direction of Forbidden Valley with such a dour and unpleasant look on his face.

He went down the hill, and at the foot of it made Odd understand that he was to remain there until he returned. Then he struck out boldly for the manor house. This building was made of logs, for Tonteur had a love for trees which was stronger than any temptation to build of stone, as other seigneurs up and down the Richelieu and St. Lawrence had done. It was a palace of giant timbers richly darkened by age and weather, and in Jeems's eyes it might have been the home of a king. It was loopholed for defence, and its windows were protected by huge oaken shutters which could be closed and barred. Not far from it was the church, even more a fortress than the dwelling, for its windows were higher, its one door heavier, and under the eaves was a long bevelled slit through which fifty men might fire down upon a foe. From both the church and the house, defenders could sweep the river with their guns. In the other direction were the gristmill and barns, and as far as Jeems could see through the clearings were the loop-holed and window-shuttered homes of the vassal farmers of the seigneurie.

Soon his feet were in the path which led to the manor. It was so still he could have believed that everyone was asleep as he courageously mounted the wide steps to the door of Toinette's home. On this door was a great black knocker of battered iron. The face of the knocker was a grinning ogre, a gargoylish head which, from his earliest memory of it, had fixed itself upon him as a symbol of the grim and unapproachable spirit that guarded the rooms within. Only twice had he heard its resounding summons to the inhabitants of the house. Now his hand reached out to awaken the dull thunder of its voice.

His fingers touched the cold iron. He hesitated in the moment he was lifting it, for he observed that the door was open by a space of a few inches. Through this aperture a voice came to him clearly. It was a high, biting, angry voice, and he recognized it as Madame Tonteur's. He raised the weight from its metal panel and would have knocked when he heard a name which made him pause in rigid silence. It was his own. Without trying to listen, yet with the discomfort of an eavesdropping position forced upon him, he learned why Tonteur had ridden up the Hill with such stern displeasure in his face.

"It is no fit place for a gentleman of

New France to be going," he heard Toinette's mother say. "Henri Bulain was a fool for marrying this good-for-nothing Englishwoman, and Edmond is a greater fool for not driving her from the country when her breed is murdering and killing almost at our doors. The woman was made for a spy, despite the pretty face which has softened Edmond's silly heart, and that boy of hers is no less English than she. The two should not be allowed to live so near to us, yet Tonteur brazenly sets forth to visit them and maintains they

women were speechless as he stood in the wide opening to the room in which they were seated. He scarcely seemed to realize they were there and looked only at Toinette. He remained for a moment without movement or speech, his slim figure tense and gripped. Then he bowed his head in courtesy which Catherine had carefully taught him. When he spoke, his words were as calm as those of Madame Tache had been.

"I have come to tell you I am sorry because of what happened at Lussan's place, Toinette," he said, and he bent

he heard an alarming sound through the open door. His mother was crying. He ran in and found her with her head bowed upon her arms and her shoulders shaking with sobs. In response to his startled voice, Catherine raised a face wet with tears and, seeing the effect of her grief upon him, tried to smile. The effort fell halfway and in a moment she was almost weeping again, with her face pressed to his shoulder as if he were a man in whose strength she was seeking comfort.

Her words came brokenly, and Jeems's mind was a turmoil of misgivings and fear as he listened.

First he gathered that his mother had been very happy at the beginning of the day. Holding him in an hysterical embrace, and weeping afresh by turns, she told him that his departure to ask for Toinette's friendship, together with Hepsibah's presence in the bosom of her family, had filled her with joy and pride. In addition to these things, Tonteur had come over from the seigneurie, and with that event her morning had overflowed with gladness.

"They seemed delighted to see each other—your uncle and the baron," she said, with a moan that sent increasing apprehension through him. "We talked about Toinette and you—and they laughed and joked together—and he was so pleased when I asked him to stay and have dinner with us—and they walked off—arm-in-arm—and then—oh, Jeems, Jeems, they went down into the stump field and had a terrible fight!"

Her arms relaxed and, as she dabbed at her eyes with a wet and crumpled handkerchief, she gave a little wail of despair.

"Your father is going now—with the ox and cart—to get Monsieur Tonteur!"

Through the window Jeems caught a glimpse of the farm conveyance plodding in the direction of the stump field, with his father flourishing a long whip beside it. Excitement replaced the suspense under which his mother's condition had placed him, and without waiting to see whether she continued the drying of her eyes or fell to weeping again, he darted out of the cabin and ran toward the scene of battle. He took a short cut across the planted ground and arrived ahead of his father, his wind half gone. It was Odd who told him the field was not empty, for nowhere could he see his uncle or the baron. Following the dog's lead, he found them both at the end of the clearing close to the pile of stumps which he had helped to tear from the earth the preceding day. Before he could see them, he heard a voice and knew that Tonteur was not dead.

"I'll cut the liver out of the dishonest scoundrel who made me this leg!" the seigneur was crying in a great rage. "He should be quartered and hung for using a hickory stick with a crack in it! With a sound leg, sir, I've have sent you over that pile of stumps, for it was as clever a blow as I ever struck!"

Jeems stopped and as he gasped for breath he thought it was strange that he did not hear a reply.

Then he ventured a few steps nearer and beheld Hepsibah Adams sitting on the ground with his back against a stump, his arms hanging limply at his sides, his round eyes wide open, and with a set and stupid look in his face.

"It's a damnable outrage!" came Tonteur's voice again. "Hickory, sir—not ash or elm or chestnut—seasoned a year, he told me—and here it is with a crack half the length of it, and an old crack, as you can see with half an eye! I'll murder him!"

(Continued on Page 14)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madame Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Jeems admires Toinette and is deeply hurt by her disdain. He hates Paul Tache, Toinette's cousin from Quebec, because Paul assumes a superior air and because he is in the good graces of Toinette.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems decides to apologize to Toinette for ruining her dress at Lussan's.

are his friends. The place they have built should be burned and the Englishwoman and her boy sent where they belong. Let Henri Bulain go with them if he chooses to be a renegade instead of a Frenchman!"

"Fie upon you for such thoughts, Henriette," chided the milder voice of Madame Tache. "I despise the English as much as you or Toinette, but it is unfair to voice such invective against these two, even though the woman is proud of her pretty face and her boy is a mud-slinging little wretch. Edmond is a big-souled man and simply befriends them out of pity!"

"Pity!" sniffed the other. "His pity, then, is an insult to Toinette and me. This English person has become so bold at his favour that she smiles and laughs in my face as freely as any fine lady in the land, and like a charlatan she lets down her hair for you to rave about!"

"Because I asked her to," said Madame Tache. "Are you angry because of that, Henriette?"

"I am angry because she is English, and her boy is English and yet they are allowed to live among us as if they were French. I tell you they will be traitors when the time for treachery comes!"

Jeems had stood with his fingers clenched at the unyielding iron of the knocker. Now he heard another voice and knew it was Toinette's.

"I think Jeems's mother is nice," she said. "But Jeems is a detestable little English beast!"

"And some day that beast will help to cut our throats," added her mother unpleasantly.

Madame Tache laughed softly.

"It is too bad the woman is so pretty," she said good-humouredly. "Otherwise, I am sure she would have less of your disfavour. As for the boy, we should not blame him for what he cannot help. I have sympathy for the unfortunate little vagabond."

"Which is not a reason why my husband should degrade himself and humiliate me by going to see his mother!" snapped the baron's wife. "If her indecency attracts him there—"

The great iron knocker fell with a crash, and almost before the sound of it reached a servant's ears, the door swung open and Jeems stalked in. The

his head a little lower toward her. "I ask you to forgive me."

Even Henriette Tonteur could not have thought of him as a beast after that, for pride and fearlessness were in his bearing in spite of the whiteness of his face. As the occupants of the room stared at him, unable to find their voices, he drew back quietly and was gone as suddenly as he had appeared. The big door closed behind him, and turning to a window near her Toinette saw him go down the steps. An exclamation of indignation and amazement came at last from her mother, but this she did not hear. Her eyes were following Jeems.

He went across the open and into the fields. As he drew near the foot of Tonteur Hill, Odd came cautiously forth to meet him, but not until they reached their old resting place at the crest of the ascent did he pause or seem to notice the dog. Then he looked back upon the seigneurie. A bit of iron had sunk into his soul. The sun was still shining, the birds were singing, the miles of wilderness were golden in their beauty, but his eyes were seeing with a new and darker vision. From the rich valley which had been the fount of all his dreams they turned to the faint gleam of distant water in the south where lay Lake Champlain, and beyond which, not far away, were the Mohawks and the English and the land of his mother's people. It was the blood of that land, running red and strong in his veins, which Toinette and her mother hated.

He dropped his hand upon Odd's head, and the two started over the homeward trail. The dog watched the forest and caught its scents, but he watched and guarded alone, for Jeems gave small heed to the passing interests of the woods and thickets. In many places the hoofprints of Tonteur's horse were left clearly in the earth, and Jeems noted these, for Tonteur and his visit to Forbidden Valley were a part of the thoughts burning in his head.

He walked more slowly through the Big Forest and approached his home from its eastern edge. He could not see Tonteur or his horse or any life about the cabin, but when he came near to it,

With the A. A.
Poultry Farmer

Shade for the Young Stock

DURING the heat of the day in the summer the young stock always looks for a cool place on the range. Fortunate is the poultryman who has a range for the young stock that supplies an abundance of shade. If the range does not furnish any shade for the young stock, steps should be taken to provide shade if normal growth is to be made by the growing pullets. Sunflowers and corn make the best natural shade. Planted in rows three feet apart and about four or six rows wide will provide ideal shade and also serve as a means of separating birds of different ages. Cultivate frequently until the plants are two feet high and then allow the birds to do the cultivating. Placing the mash hoppers and water fountains in the shade will increase feed consumption and promote uniform growth in the pullets.—A. K.

silence had fallen at his appearance, his father came with the cart.

Henri first gave his assistance to Tonteur.

"If this humiliation and disgrace becomes known, sir, I'm ruined," the baron declared, allowing himself to be lifted until, with Henri's support, he stood balanced on his one good leg. "To hop like a frog, and be carried behind an ox like a bag of wheat—my God, sir, it makes me blush with shame!"

Jeems went to his uncle, and with his aid Hepsibah climbed to his feet and stood dizzily, watching with cheerful appreciation as Henri Bulain hoisted Tonteur into the cart.

"He's a most ree-markable liar, Jeemsey, this man Tonteur," he said. "I'll swear it wasn't his wooden leg that hit me, but a jemmy of iron wielded by the devil himself, or one o' these stumps flying on its own account. It was a mighty blow!"

He made an effort to walk and would have fallen if Jeems had not exerted his strength to hold him up. Henri, having successfully loaded Tonteur, returned to assist Hepsibah; and the trader, struggling like a drunken man to maintain an appearance of proper equilibrium, permitted himself to be lifted in beside the baron.

From the window of her cabin, Catherine saw the cart coming with its human load.

(To be Continued Next Week)

Taxpayers Appeal Rural School Improvement Society Case

(Continued from Page 2)

powers thus conferred by the statute. I, therefore, find that the action of said district meeting was unauthorized and must be set aside."

"It is a fundamental proposition of law that a public body created by statute and permitted by law to vote taxes for public purposes must keep within the limits of the statutory provisions applicable thereto and cannot transgress such limitations. If it were possible for this district meeting to contribute its moneys to the 'New York State Rural School Improvement Society, Inc.,' there would be nothing to prevent such meeting from making similar contributions to other corporations, associations or individuals having for their avowed purposes the improvement of civic affairs and conditions but having no connection with the public school system. As the law now stands there is no such authority. Therefore, the action of said district meeting in voting to send \$10 to said Rural School Improvement Society was illegal."

This decision supports the statements that American Agriculturist have given our readers right along, that trustees and school districts were taking a great risk and running the danger of losing public money by appropriating money for the purpose of sending it to the officers of the Rural School Improvement Society.

The temperature two inches from the litter under the edge of the hover in the brooder should be from 95 to 100 degrees Fahrenheit during the first two weeks. The third week it should be from 90 to 95 degrees and after that gradually lowered until no heat is needed.

Unfortunately, mash hoppers and water fountains won't grow in size along with the chicks. The idea is to change the size of the containers as the chicks grow. Feed and water are wasted when fed in too small containers.

Keep the Old and Young Stock Separate

IN almost every flock there are layers and breeders that are carriers of coccidiosis and intestinal worms. Although these birds appear to be healthy and are laying, they are a continued source of danger to the growing stock. Keeping the old and young stock separated will prevent this source of disease. Confine the old stock to small yards or to the laying house. Better summer egg production will be obtained if the layers are confined to a cool, clean laying house. In many cases it is advisable to confine the young stock to the clean range. This prevents them from ranging on the old ground that the old stock used.

Last year, poultrymen who followed the practice of keeping the old and young stock separate had a 6% lower mortality in their young stock than the poultrymen who followed the old practice of allowing the old and young stock to range together.—A.K.

The Plains of Abraham

(Continued from Page 12)

Jeems stared at his uncle. Hepsibah was rolling his eyes and making an effort to answer. A sickly grin spread over his countenance.

"I'll make you a leg—that'll last—friend," he said weakly. "A good leg—better leg than that—hickory, too—an honest leg—carrying no hidden crack in it."

"With a leg like that, no crown in Christendom could have stood the blow I gave you," Tonteur answered from a point which Jeems could not see. "A blow having just the right slant to it, and catching you properly as you lunged. It wrenched my backbone, sir—the sheer force of it! Do you declare yourself vanquished, or will you take advantage of my condition, with only one pin to stand on and none whatever to fight with?"

"I'm a little stunned, brother," acknowledged Hepsibah, managing at last to get a hand to his head. "But atop o' your luck I don't like this bit o' vainglory in your talk. I've been harder hit, but never before with wood. You couldn't do it again in a brace o' years, and as soon as I've made you another leg I'll prove it to you!"

Jeems heard the rattle of the approaching cart and advanced into the presence of his uncle and the baron. Toinette's father, like Hepsibah, was on the ground. His clothes were awry and stained with earth, a great lump was rising on the side of his face, and, as Jeems quickly observed, his wooden leg was broken off close to the knee. Upon this scene, over which a profound

"Hope Springs Eternal...."

IN spite of the fact that we expose some fraudulent home work scheme every week or two, we continue to receive an average of ten letters a day on this subject.

About half of them ask concerning the reputation of a particular home work scheme, the other half are requests that we collect for work already done. In a small percentage of cases we are able to collect for our readers

A "Thank You" Is Our Pay

RECEIVED your letter Monday, and also received one from the company, with a check for \$22.00, for which please accept our thanks, as we do not think we would ever have gotten anything without your help. Thank you again. I will always remain the friend of American Agriculturist.

but so seldom and with such difficulty that we have refused to recommend any home work scheme to our subscribers. For this reason letters asking for our opinion of any such scheme are useless. We have already given our opinion of them both singly and collectively but in case any of our readers have failed to read our opinion we are glad to repeat it.

Home work schemes might be classified as follows:

1. **Home sewing.** Modern machinery is too efficient to hope for successful competition from the home sewing machine or needle.
2. **Correspondence courses.** Many firms that advertise home work are interested in selling instructions in one of the following.
 - a. Show card writing or art work.
 - b. Movie scenario writing or story writing.
 - c. Clipping bureau instructions.
3. **Outfit selling.** Some schemes are interested primarily in selling a sample outfit to gullible prospects. Among them are:
 - a. Dresses or aprons.
 - b. Water colors for post cards.
 - c. Embroidery outfits.
4. **Agents.** Many publications publish advertisements for agents under "Help Wanted." The returns for this work will of course depend on the selling ability of the agent. This, of course, is not a true home work scheme, anyone, willing to sell on commission, can get a job at any time.

We do not say that all home work schemes are fraudulent. The big majority are and most of the balance get work done for starvation wages with a good chance that full pay will not be received.

Running a fraudulent home work scheme seems to us to be a particularly low-down way of getting a living, since it preys on folks who are least able to lose. The amount lost is usually small but to those who lose it, it is considerable not to mention the disappointment coming from the failure to make some money to help meet expenses.

J. A. Stransky Charged With Use of Misleading Advertising

FOR some time we have been receiving letters either asking about the reliability of the J. A. Stransky Manufacturing Company, or contain-

ing complaints about the vaporizers which the company puts out.

Now we learn that the United States Federal Trade Commission has made a complaint, which states that the J. A. Stransky Manufacturing Company has been, and is, using unfair methods of competition. The complaint mentions the claims made in the advertising of this company, a few of which are as follows:

1. \$500 per month selling a new patented Fuel Vaporizer guaranteed to save up to 50% in gasoline; 40 miles per gallon made with Ford car."
2. "Ford runs 57 miles on gallon of gasoline."
3. "You are losing half the power of your gasoline."
4. "This will tell you how you can save 50% on your gasoline."

The complaint goes to say that in fact, the effect of the vaporizer, when attached to an automobile, is very slight under any conceivable conditions, as compared with the claims made by the company.

Subscriber Gets Pay for Eggs

I received a check from covering the three cases of white henry eggs concerning which I wrote you some time ago. If it had not been for your services I do not believe that I would have received this, so I wish to assure you that I am ever grateful to the Service Bureau of the AMERICAN AGRICULTURIST.

OUR correspondence between our subscriber and the firm buying his eggs disclosed a misunderstanding which we were glad to straighten out. The following is a portion of a letter received by us, from the dealer:

"Replying to your letter, we enclose duplicate return slips showing that checks were sent to your subscriber some time ago, and we believe that he is taking advantage of you, and trying to get your assistance in trying to collect an account which has already been paid."

We were able to convince the dealer that whereas our subscriber had received checks for some shipments, that he had not received returns for all shipments, and a check was sent to our subscriber.

A Misunderstanding Is Ironed Out

For several years I have been growing canning peas for the They always furnished us with the seeds. Last year I returned two bushels, and failed to get any credit for them. I have written the company, but do not get a reply from them. I would appreciate your help in getting my refund.

WE certainly appreciate the prompt and courteous way in which the canning company handled this complaint. First they reported that their records showed no letter received from our subscriber in regard to the matter. It is possible, of course, that the letters were mislaid or lost. Their investigation showed that the two bushels of peas had been picked up by one of their field men, and he in turn had sold them to another producer, but had neglected to report either of these transactions to the office. As soon as the facts were determined, the company gladly refunded the price of the seeds to our reader. The company expressed their thanks to us for calling the matter to their attention, so that the deal is now closed to the satisfaction of everyone concerned.

AMERICAN AGRICULTURIST is printed at Poughkeepsie, but our business and editorial offices are at 461 Fourth Avenue, New York City. Please direct all editorial and advertising mail to New York City. If you send it to Poughkeepsie, it will be delayed in answering.

America's **FIRST** Engine-Powered Washer *The* **MAYTAG**

The First Maytag
Gasoline Multi-Motor

A Later
Model

1929

THE Maytag Gasoline Multi-Motor makes the world's finest washer practical for farm homes without electricity. Over fifteen years ago, this marvelous little Maytag engine was introduced—the first time that a washer and an engine were combined in one unit.

To supply the demand for the self-powered Maytag today, more gasoline Multi-Motors are built than any other single-cylinder gasoline engine in the world. Thousands of them are making easier washdays for farm women everywhere.

The New Gasoline Multi-Motor

The NEW Maytag gasoline Multi-Motor has but four moving parts. The carburetor is flood proof and has but one simple adjustment. Bearings are of high-grade bronze. Bosch high tension magneto and speed governor give it a smooth reliable flow of power....step on it, and away it goes. By removing only four bolts the Multi-Motor is interchangeable with the electric motor.

A New York Farmer Sees Bermuda

Where the Chief Business is to Entertain Tourists

PERHAPS the most astonishing fact concerning Bermuda is that such an utterly insignificant speck of an island should ever have achieved so much of a place in the world. We may have—as I did until recently—only the haziest idea of its size

Jared Van Wagenen, Jr.

or location or government but everyone with the slightest agricultural interest has heard of Bermuda onions and Bermuda potatoes and every Easter at least we have been reminded of Bermuda lilies.

The hardest thing is to realize just how small a speck Bermuda is. We might make a comparison. The tight little island of Manhattan was settled about a dozen years later than Bermuda and according to tradition the aborigines thought they had driven a particularly shrewd bargain when they sold it to Peter Minuet for twenty-four dollars. By the way, a plot of this original purchase has recently been sold for more than six hundred dollars per square foot—and it is not very good for farming at that.

Well, Manhattan Island has, to be exact, an area of about 14,209 acres—but all Bermuda has is only 12,300 acres.

In its physical features, it is a sort of microscopic reproduction of a continent. It has an iron bound coast line with many harbors. It has rolling plains and stretches of swamp and dark evergreen forests and rugged mountains—but the highest summits rise less than 300 feet.

Or if you want another illustration it is only one tenth as large as the small county of Schenectady, yet in its political and governmental organizations it

By JARED VAN WAGENEN, JR.

maintains all the pomp and ceremony of an imperial commonwealth.

Bermuda has now about 29,000 inhabitants, nearly two thirds of whom are colored. In the course of the year the island is visited by nearly 40,000 tourists and the number seems to increase with much regularity at the rate of about 10% each year. Bermuda has no manufactures and only a limited and insufficient agriculture. Her greatest asset is a lovely climate said to be one of the most equable in the world and the one great business is entertaining the tourists. If that perennial stream should suddenly dry up, ruin would inevitably overtake everything. Nevertheless, I talked with thoughtful men who did not by any means regard the tourist as an unmixed blessing. The development of this particular business has enormously inflated everything including, of course wages and the cost of living, and one man soberly declared that Bermuda was the most expensive country in the world in which to live. If you are keeping a hotel or directly ministering to the tourist in any way, this may work out all right but it

makes hard going for the Bermuda farmer. Every thing he must buy has gone up—his labor supply most of all—but the price of garden truck in New York continues to be determined to a great extent by Florida and Texas and the Carolinas—regions with very much cheaper land and lower living costs. The only wonder is how he survives at all.

I have said that almost two-thirds of the Bermuda natives are colored, but the negro of Bermuda is a very different individual from the black man of our own Southern states. He is surely, on the average, very much better educated and his speech and accent is that of the intelligent white man. There is very evident reason why this is so. Throughout all the earlier history of the island slavery flourished and almost every white family of any pretensions held a few slaves but because of the lack of any large land holdings these were either seamen or house servants. The great gangs of plantation slaves were absolutely unknown. Because the slaves were closely associated with and had much contact with the whites, they came to use the speech and to a great extent the manners of their masters.

Doubtless it is not too much to say that he learned to think the white man's thoughts. I talked with a considerable number of colored men and was much impressed with their intelligence and gracious friendliness and politeness.

Here may be a good place to observe that when it came to the great moral reform of getting rid of human slavery, we here in America among civilized nations came pretty near bringing up the tail end of the procession and finally achieved it only after a particularly sad and horrible war. Somehow, England managed this much better. As early as 1834 she came to the conclusion that this institution must

Fruit Growers Report On New York State Crop

EDITOR'S NOTE—Each year about July 1, the New York State Horticultural Society and the New York State Department of Agriculture and Markets, cooperate to prepare an early summer report from members of the Society on fruit conditions. The report this year gives the composite opinion of 215 members of the New York State Horticultural Society from all fruit producing sections in New York State. It should not be confused with the regular government crop report which will be issued later. The report is as follows:

* * *

THE blooming season for tree fruits was in general about two to four days earlier than last year and about the same as in 1927. Cold weather during the season of bloom, with cloudy or rainy weather in some cases, was quite general. Most fruits, except pears, bloomed better than last year, for the state, as a whole, though there were sharp contrasts between various sections and orchards.

For the state, as a whole, the "condition" of the fruits, excepting quinces and cherries, was below that reported at the same date last year (between June 19th and June 27th). Generally speaking, conditions appear to be best in the Champlain Valley, not espe-

The Condition of New York's Apple Crop

1929 1928 1927 1926
(Percent of Normal)

All Varieties Combined	52	55	45	69
Fall Varieties	52	66	48	77
Baldwins	60	39	42	63
Greenings	39	60	31	75
McIntosh	38	40	48	50
Northern Spy	43	43	52	37

cially good in Western New York, and rather poor in the Hudson Valley. Both the comments and figures submitted by various members indicated a wide range in conditions, from very good to near failure, even in the same county. The whole fruit situation is very irregular. In making use of the condition figures in comparison with earlier years, it should be remembered that the rest of the season may be more or less favorable than usual.

Apples:—Comments on apples indicate considerable trouble with aphids and scab. In the upper Hudson Valley, early season freeze and frost damage was quite apparent. The state average condition of all varieties is slightly over last year with Western New York better and the Hudson Valley considerably poorer than a year ago. Fall varieties are generally reported lighter. Baldwins, the leading variety, better, Greenings substantially below last year, McIntosh only slightly better in Western New York and much poorer in the Hudson Valley, and Northern Spy about the same in Western New York as last year, but much below in the Hudson Valley.

Pears:—The July 1st condition of pears appears to be the poorest in years, with Bartlett, the principal variety and also Seckel, nearly a failure, and Kieffers very light. Many trees did not bloom and others set very lightly.

Peaches:—In relation to other fruit crops at least, peach conditions are very good, though in no way exceptional.

Cherries:—Sour cherries, particularly light in the Hudson Valley, are much better than last year in Western New York, while sweet cherries are about the same as last year, for the state, but very light in the Valley, and much better in Western New York.

Quinces:—Quinces though not important, except in a few areas, are up to last year.

Grapes:—Grapes, substantially below last year, in all areas, nevertheless have fair promise.

This Pennsylvania Herd Is Abortion-Free

The Results Justify the Time and Cost Required

EDITOR'S NOTE—Due to the prevalence of contagious abortion and the great losses sustained by dairymen we have given a considerable amount of space in recent issues to a discussion of the problem. This week, Professor Fitts of the Pennsylvania State Agricultural College tells how the disease was cleaned out of a Pennsylvania dairy.

THAT contagious abortion or Bang disease can be eradicated from a herd of cattle and the herd thereafter maintained free from this disease is being amply demonstrated on many dairy farms in Pennsylvania. A typical example is the Ayrshire herd kept on Penshurst Farm, Narberth, Pennsylvania of which Mr. Percival Roberts is owner and Dr. E. S. Deubler, Superintendent.

This herd consists of about 275 cattle of all ages of which 140 are milking cows. The herd was the first in Pennsylvania to receive a Federal certificate as "Tuberculosis Free" and has been on the accredited list since 1918. To this herd also belongs the distinction of being the first certified milk herd in the United States to be officially certified as free from contagious abortion and has now been maintained on the Pennsylvania accredited list for a period of four years.

Victory over the abortion disease was not easily won owing mainly to a lack of adequate information regarding the disease in all its phases and aspects.

Drugs Prove Ineffective

On Penshurst farm the battle with the disease raged over a period of many years and included thorough trials of such "remedies" or "cures" as carbolic acid, methylene blue and use of douches

and washes none of which helped in any material degree in either curing or eradicating the disease from the herd.

In 1914 the blood test was first applied to this herd. Surprises were revealed in that many animals breeding regularly and carrying their calves full time reacted to the test.

Blood Test Proves Reliable

The entire group of positive or reacting animals were, however, finally placed in a barn by themselves about 100 feet distant from the barn where the non-reacting or negative animals were kept. Precautions were also taken to prevent workmen passing back and forth between the barns. Retesting was not consistently followed up, however, and numerous abortions in the supposedly clean or negative herd led to serious doubt as to the value of the blood test as a diagnosing agent and early abandonment of this first attempt to eliminate the disease by this means followed. In the light of later knowledge Dr. Deubler attributes the failure of this first attempt to the mistake of considering an abortion as the disease instead of one of the several symptoms and also to testing cows in all stages of pregnancy and lactation. Cows should be tested when open, if possible, for the test is not always strictly reliable in the case of a pregnant cow.

It was not until 1921 or seven years later that confidence was regained in the blood test as a reliable means of detecting the disease. During that year the blood test was again applied to the entire herd and the positive or reacting animals were segregated, being placed on the opposite

side of the stable from the non-reacting or negative animals with a wide feeding alley between. The positive animals had separate lots and pastures and were isolated at calving time. Tests were made every two months and any reacting animals discovered in the negative herd were at once removed. *The repeated tests showed that negative animals sometimes became positive but that positive animals never became negative.* This fact strengthened belief and confidence in the test. Other supporting evidence was that a careful study of the breeding records of all positive cows showed that nearly all had aborted once or more during their lifetime excepting those that had contracted the disease.

The number of negative animals becoming positive continued too great to suit the owner and so the entire positive herd was removed to a barn on another farm. The herd was kept on this farm for a period of two years or more in the hope that the disease might finally run its course and the animals again become negative. This did not occur, however, and the positive herd was eventually sold.

Success Comes Eventually

Progress was rapid from the time of removal of the positive animals to a separate farm. The stable they had occupied was thoroughly cleansed and disinfected and then used for healthy animals. The bi-monthly test at first showed infrequent reactors but soon came a time when no more reactors appeared and after several clean tests the herd was certified as clean and has continued clean since that time. The owner has expressed great satisfaction in being able to rid his herd entirely of abortion and has said that the

Dynamite Put This Field to Work For Us

We Made Stumps Into Firewood and a Brush Patch Into a Cornfield

A TWENTY five dollar investment in dynamite solved a perplexing labor problem for us and in turn gave us a five acre field that has proven the most profitable part of our farm. In fact we turned a worthless tract of land that had not seen a plow for over fifty years and a part of which had not been farmed for upwards of a century into a tillable area.

Several years ago we bought a small farm in Southern New Jersey, that like hundreds of others contained an old and overgrown apple orchard. The trees had been planted shortly after the war of 1812 and had outgrown their usefulness. This old orchard stood on two sides of the buildings and had become overgrown with locust and sassafras trees that stood thirty feet high.

For two years we had been unable to plow with the tractor a certain part of this farm on account of the old orchard with its heavy growth of underbrush. So one spring we decided to clean up the old orchard and plant it to corn. It was a relatively easy task to clean off the briar patches and burn the heavy canes, but the removal of the old trees and stumps was another problem. Labor was scarce and wages were prohibitive at that time and we started in with the pick and shovel to dig out the trees. A few hours at this work soon proved that we were not equal to the task. The next day a neighbor told us to get his stump-puller and tear them out. He assured us that it would be easy work and he would let us have the machine free of charge. We grasped at the suggestion

and went to work. One day's work presented another problem that was more perplexing than the first,—what were we to do with stumps. The puller brought out the trees and the roots in fine shape, but they took up more space out of the ground than when the trees were standing.

It was a half mile to the nearest dump and one trip with the team hitched to a thirty inch apple stump convinced us that here was another problem almost as puzzling as the job of digging them out. Rather than admit defeat we decided to cut down the trees and use the wood for the hot beds. The land we could plow with horses, working around the stumps for a year or two until they had started to rot, and possibly then

they would come out much easier. Before we had the trees worked up for hot-bed wood, a buyer of apple logs came and took them off our hands at a good profit. About this time we heard of a neighbor who had removed some big stumps with the aid of explosives and had done a good job. With this unexpected bit of change from the sale of logs my brother suggested that we buy some dynamite and finish up the job, as he was convinced we could do as good a job as our neighbor.

So we secured a quantity of a 40 per cent explosive and started work. In two afternoons, we removed upwards of fifty stumps from the field. Many of them were from 10 to 25 inches in diameter and very solid. By using dynamite one of our big problems was solved. The force of the explosive usually tore the stumps to pieces so that they could be easily handled by one man. Even the pieces of the roots, often four or five feet in length did not require any further cutting to prepare them for the hot-bed furnace. The next problem was to get the holes filled up after the stump had been blown from the ground. This proved to be much easier than we had anticipated. By taking a shovel and breaking down the sides of the hole it left only a slight cavity to show where the tree had stood.

After the ground was plowed and harrowed the hole had practically disappeared. The field was planted to corn and before the last cultivation there was not a trace of the old

The hole where the stump was. Dynamite solved a perplexing labor problem and made a five-acre field profitable.

Vol. 124 July 20, 1929 No. 3

Charles S. Wilson, of Hall, N. Y., Appointed to Farm Board

THERE is comparatively little interest on the part of eastern farmers in the new Agricultural Marketing Act but there will be no great amount of criticism of the appointments already made to the Federal Farm Board.

Some will question the appointment of Alexander H. Legge on account of his connection with the International Harvester Company, but our own opinion is that he will be fair and sympathetic with the farmers' problems and that his ability and experience as an executive will be big assets.

The appointments of C. S. Denman, president of the National Livestock Producers' Association, Carl Williams, former president of the Cotton Growers' Exchange, W. F. Schilling, president of the Twin City Milk Producers' Association, and Charles C. Teague, former president of the California Fruit Growers' Exchange, make it very evident that President Hoover is depending to a very great extent on the farmers' cooperative organizations for the success of his farm relief legislation.

It is the opinion of many leading farmers, including the officers and members of several of the largest cooperatives, that these farm organizations should not assume the responsibility for the success or failure of the Agricultural Marketing Act and the Federal Farm Board. Many farmers, and this is particularly true of eastern farmers, look upon the whole move as an experiment with only about ten per cent chance of success. They therefore believe that if too much responsibility for the success of the plan is placed on the cooperative organizations, and if the plan fails, the farmers' cooperative movement will receive a blow from which it cannot recover in years. As to the ability and sincerity of the above named cooperative representatives on the Farm Board, there can be no question.

President Hoover has given one of the last places on the Farm Board to Charles S. Wilson, of Hall, New York. Mr. Wilson's appointment is excellent. In the first place, it would be decidedly unfair for eastern farmers, not to be represented on this Board. Farmers in the East are not only not enthusiastic over the Marketing Act but they feel that it is likely to do their interests more harm than good. A member of the

Board from this section having the confidence of farmers, as Mr. Wilson has, will do much to allay this feeling.

Moreover, Washington and other sections of the country usually seem to forget that New York and other eastern states are the leaders in the production of many agricultural products. This is the greatest milk producing section in the world. Fruit, poultry and truck products are a close second, and therefore the appointment of an outstanding and practical farmer like Mr. Wilson to represent these great eastern agricultural interests is especially commendable and desirable.

Mr. Wilson is a graduate of the New York State College of Agriculture and for several years was head of the Pomology Department at the College. He left this position to become Secretary of Agriculture of New York State, and then returned to his home farm at Hall, New York, where he is one of the largest producers of apples in the State. Therefore, in ability, experience and personality, he is finely equipped to make a real contribution as a member of the Federal Farm Board.

Counties Now Receiving Share of Gasoline Tax

ALL New York State farmers will be interested in a statement just issued by the State Tax Commission on the receipts of gasoline tax so far. Up to July 9, nearly \$2,100,000 had been taken in by the State for the tax collections for the month of May and payable by July 1, but on the day of certification about \$1,500,000 had been collected. Of this, the State itself will receive \$1,041,458.05 as its share of the first month's collection. The City of New York will get \$69,430.53, and the sum of \$277,722.15 will be distributed among the counties, each of these counties receiving a sum depending upon its proportionate share of total mileage of highways outside of cities and incorporated villages in the county and not including State and county highways. For each county's share see our news page this time.

This is only for one month. Tax experts estimate that the gasoline tax will bring in a total of \$24,000,000 a year. The State's share of this will go to building and maintaining State highways, and the counties' share will be used toward building county highways.

Think what this is going to mean in the relief of local road taxes and in better roads. In time, the money received for the county highways should make it possible for the counties, if it is properly used, to build good roads to replace most of the present dirt roads in the counties. Great emphasis should be placed on the need of all taxpayers seeing to it that these large sums received from the State are properly and efficiently used by local officers for the purposes for which they are intended.

As we have pointed out time and again in this paper, the road and school laws passed by the last New York State legislature are the most important farm legislation that has been passed in this State, and, we think, in any state. But it will do no good for the State to try to relieve the local tax, road and school situation unless there is full cooperation on the part of local taxpayers and officers to see that the money so received is well used.

Farm and Feed Prices

ACCORDING to G. F. Warren and F. A. Pearson of the New York State College of Agriculture, writing in the June issue of Farm Economics, farm prices declined this spring from 146 to 142.

"This was due to declines in prices of grains, cotton, hay, sheep, beans, and potatoes. The decline in prices of these products was in part counterbalanced by advances in the prices of eggs, butter, beef cattle, veal calves, hogs, chickens, and horses.

"In New York State, the prices of milk, poultry, and butter have been favorable for the farmers.

Dairy and poultry farmers also have been favored with lower prices of food. Grain, hay, apples, and potatoes have declined in price.

"The decline in grain prices has been reflected in the decline in feed prices. Gluten feed has declined about \$10.00 per ton; bran, middlings, wheat-mixed feed, cottonseed meal, \$6.00 to \$8.00; and cornmeal, meat scrap, and oil meal \$3.00 to \$4.00 per ton.

"The wholesale price of a dairy ration declined from \$46.13 to \$39.58. The index numbers declined from 156 to 138.

"In May of 1928, seven dozen of the best eggs at New York City wholesale price would exchange for 100 pounds of feed at wholesale prices; this year, six dozen would buy 100 pounds of feed.

"In May 1928, 100 pounds of 3.7 per cent milk in the Utica freight zone would buy 89 pounds of feed at wholesale prices. This year, it will buy 123 pounds. This favorable ratio of feed prices to milk prices, together with the need for more milk this fall, justifies the feeding of grain on pasture, so as to keep the cows in condition for fall production."

It was very interesting to note the decline and rise in the price of wheat in recent weeks. As stated above, it went down and down considerably below a dollar and made a record low price for the past several years. Then dry weather conditions in the West, coupled with the passage of the farm relief bill in Washington, started the price of wheat the other way, with the result that on July 9th it was quoted at \$1.20.

It is always a dangerous business to prophesy. All we can do is to give you the facts, and sometimes state our opinion. It is our opinion now that it is a good time to buy dairy feeds. We do not believe that the farm relief bill is going to bring any permanent farm relief to anybody, but it will undoubtedly have a temporary effect on prices, particularly grain prices. This has already been evidenced by the rising price of wheat. If these facts are true, then prices of feeds are likely to go up in the next few months and be much higher this winter.

It is something for dairymen to think about as to whether or not they want to contract at this time for a considerable portion of their feed for this fall and winter.

Regulating Production in New Jersey

NEW Jersey farmers are to be congratulated for their efforts toward growing the kind and amount of crops that the markets demand. The New Jersey Experiment Station has been very active this year in bringing information to New Jersey farmers on what crops to plant and the amount and kinds the market may be expected to absorb. The Station has held one hundred and fifty farm meetings, attended by more than 6,000 farmers, and has thoroughly discussed the New Jersey and the national crop outlook for such products as New Jersey farmers raise. The Experiment Station also broadcast over New Jersey a statement of the crop outlook so farmers had some idea of what might be expected.

Of course, no one can prophesy accurately what any season will bring forth. The amount of rainfall and other weather conditions have large effect upon the yields of all crops, but much more can be done in all states and by all farmers than is now being done to prevent over-production and to fit production to the market demand.

New Jersey readers will find a fuller account of this work in the special New Jersey news edition of this issue.

Eastman's Chestnut

WE have had so many letters lately from our readers asking for information about the milch goat business that I have come to wonder if all of our dairymen are not getting ready to change their cows for goats. Perhaps it is because the goat is such an easy keeper, doing well in the back yard, living on tin cans, broken bottles, etc.

Probably you have heard the old one about the colored employee of an express company who approached his superior with the question:

"Boss, what we gwine t' do 'bout dat billy-goat? He's done et up where he's gwine!"

Eastern Agriculture Is Changing Fast

Observations from a Thousand Mile Trip Through Farm Country

By C. E. LADD

Extension Director, N. Y. S. College of Agriculture

I HAVE just driven a thousand miles through central and southern New York studying its farming, recalling its history and dreaming of its agricultural future. New York's agriculture is changing and changing fast. To anyone who has known these regions for some years, many new things are in evidence. Some of them are pleasing and some of them are not so pleasing; but they all tell the story of the change that is taking place on farms.

C. E. Ladd

Perhaps the most far-reaching change is the rapid development of improved roads throughout the countryside. The wonderful new trunk line roads and the many miles of narrower, country built macadam roads are reaching back into the country in all directions. Wherever they go they bring within a few years better looking farms, better painted buildings, and better worked land, if there is any fundamental fertility in the soil. These hard surfaced roads tap the great resources of an agricultural state and produce a wonderful flow of food into the city markets.

Cities Have Interest in Roads

City dwellers with a vision, looking forward to adequate farm supplies in the near future, and farm people with a vision, looking forward to a permanent agriculture, might well cooperate in planning a program of building in the state that would bring about the most rapid possible development of these hard surfaced lateral roads.

New York is rapidly becoming a blue flowered state. In 1909 we had only 35,000 acres of alfalfa. In 1925 this was increased to 198,000 acres of alfalfa and it is quite evident that the census of 1930 will show considerable increase since 1925. All over the state, in the dairy regions and outside the dairy regions, this blue blossom is showing up in the meadows. The use of lime, the use of acid phosphate, and the use of well adapted seed are beginning to bring results. It also seems to be a particularly good year for clover. Farmers are remarking about the quality of their new seeding. This too is probably the result of what we have learned during the last decade about well adapted seed, the use of lime and the use of acid phosphate.

Haying Is Earlier

One who has known the state for many years can't help but be impressed with the observation that haying is being started a little earlier than usual. All through the southern part of the state there were small fields of hay already mown by the 15th of June, and by the 25th of June mowed fields were quite common. Evidently dairymen are beginning to appreciate more and more the necessity for cutting hay early if they are to have good quality. Perhaps the efforts of the various associations engaged in the drive for more milk next November, and advising early cut hay as one of the means for obtaining more milk have had some effect on this in the state. We hope so at least.

The corn crop is just getting its first cultivation. On some farms the fields are as clean of weeds as can be, on others the grass and weeds are coming about as fast as the corn. Some men are going to have a rather difficult problem to get the weeds out of their fields in the next few weeks. To me there is always a magic about this crop at this time of year. I look at the small plants standing only three or four inches high and say to myself, "Little plant you must grow two inches a day on the average for the next sixty days, and some of you that are on very fertile soil will grow

nearly three inches a day." It seems almost impossible that it can be done and yet all of our past experience with the crop tells us that it will be done. The hot, dry weather during the last of June has been just the kind of weather that delights those corn plants. You could fairly see them grow.

Pastures Must Be Improved

A very considerable proportion of our dairy farms is in pasture. Many pastures are looking pretty thin and some have been entirely too closely cropped. Thorn apple trees, brakes, and other weeds are coming in and taking the place of the grass. You seem to hear these old hillside saying, "We have served you without compensation for many generations, now when do you expect to do something for us?" And as you look up over those steep hillsides and see how far it is from one good bunch of grass to the next, it seems as if something must be done. Those cows out there on the pasture aren't the same sort that our grandfathers had. They are not long-legged and easy travelling critters. They can't afford to travel many miles for their daily provision. These are big black and white cows swinging a great big udder between their legs and doing their work in an intensive fashion. They are producing twice as much milk as our grandfathers' cows produced and they need about twice as much feed and about half as much travel. For their sake, the pasture must be improved. Our cows are growing bigger and better each year, and if this progress is to continue, our pastures must keep pace in intensity of production with the development of the cows.

Timothy No Longer Profitable

Some way, I can't help feeling that we are just starting a big new change in the layout of our farms. For many years we grew timothy hay on the back fields that we couldn't afford to crop in any other way. We seeded

them down occasionally and cut the hay as long as it was good and a little longer, then plowed them up, and seeded them down again as soon as we could. For pasture land we used our woods and the roughest fields on the farms, those that couldn't possibly be mowed over with a machine. Now timothy is no longer a profitable crop. Those back fields that formerly produced timothy, but were never used much for corn, potatoes, or cabbage can no longer be cropped. With high priced labor we must keep our men on the fields where every hour of labor will give us the biggest possible return. This means the level fields, the large fields, the easily tilled fields, the fields nearest the barn.

Rotations Are Changing

A great change is coming on these farms, a gradual concentration of the rotation of crops on these fields that will use labor more efficiently, the adoption of more three and four year rotations instead of six and seven and eight year rotations. At the same time those old timothy fields or old hay fields that were farther away will be thrown into pasture and the cows in turn will be brought out of the woodlot, and the woodlot given a chance to really produce trees. Probably many of our old pastures should be reforested. Using these better lands for pasture we can afford to do much more to improve them. We can afford to seed some of them with a better pasture mixture. We can afford to spread lime and acid phosphate and a little manure on them. This, I think, will be one of the big moves of the future in dairy farming in central, western, and northern New York. Of course, a part of that wooded land will be kept in pasture. We need the shade. Many of those wet lowlands will be kept in pasture. They would not produce woods well in any case and they produce wonderful pastures. Some areas like Delaware County, with better pastures than most of the state, will continue to pasture them as they

do now but will improve small areas whenever there is opportunity.

Oats Not Up to Normal

Oats do not look good to me this year. They are too short. They are too thin. They do not look as if the weather had been good to them. Although we raise nearly a million acres of oats a year in New York State, it is not an important crop on most of our farms. In any case we will get straw for bedding, our seeding of clover, and we will get some crop of grain; how much remains to be seen.

If you drive through the Genesee Valley section and the great farming territory just east and west of it, but not going too far south, into the hills, nor too far north into the fruit region, you will be impressed with the possibilities of that great section as a dairy region. Wheat is no longer a profitable crop in most of the region, although much of it is raised. Beans have not been as satisfactory as in some former years. Much of the land is a little too heavy for potatoes and there is no tendency to greatly increase the cabbage acreage.

With the loss of hay as a cash crop, dairying seems the most profitable business. Many of these farms grow wonderful bluegrass pasture. In addition they can raise the wonderful supplement to bluegrass pasture; temporary pasture of sweet clover. They can raise alfalfa for their roughage. They can raise fine corn. These farms at the present time are not stocked with dairy cattle to anywhere near their capacity. They are in the midst of a change. It is quite possible that we shall see a very large increase in dairying here within the next five years.

More Milk Can Be Produced

Sometimes our city friends ask whether or not New York State can produce the milk that New York City needs during the next five or ten years. If they will take a drive through the open country and if they are capable of understanding what they see, they will go back feeling that New York State, if given the proper price stimulus, and the time for preparation, can produce all the milk that New York City will need for many years to come.

June is a beautiful month for travel, but to the farmer it is not the most beautiful month in the year. The meadows are likely to look a little too ragged. The weeds show up above the clover oftentimes. The oats are just at that uncertain stage when you wonder whether there is going to be a crop of any consequence. Corn is just being cultivated. Often times it looks weedy. Anyhow the plants look small and unthrifty and utterly incapable of growing to the great size that we know they will attain. Potatoes are still under the soil with hardly a sprout showing through. Cabbage and tobacco is just being set. Of all the crops wheat alone begins to show a fair promise for the harvest this season. It is an unsatisfactory month in which to travel in many ways. Your hopes and your fears are mingled and a real judgment as to what the harvest will be is impossible this early.

The prettier time will come some two months later when the potatoes cover the ground, when the cabbage spreads from row to row, when the corn has far outgrown the weeds and is standing up high in the air and waving in the wind, when the alfalfa fields have been cut over and the fresh new green is showing up as lush and as vigorous as if it were just starting in the early spring. This to the farmer is likely to be an even more beautiful time than the month of June.

My Favorite Song

A. M. C. writes us that he thinks if he had to choose just one song he liked the best, it would be "America, The Beautiful." His judgment is good. In our opinion, this is a much better song so far as poetry and fine sentiment go, than "My County 'Tis of Thee."

We are getting a large number of favorite poems and are glad to have them. Kindly do not send those you write yourself. Those that we have room for, or the ones that have the most votes, will be broadcast over General Electric Company's station WGY at Schenectady and will be published in American Agriculturist.

Are you listening in to the "Visits with the Poets of the Farm and Home" which are prepared by E. R. Eastman, editor of American Agriculturist, and broadcast every Thursday at noon, eastern standard time, over WGY?

"America, The Beautiful"

O beautiful for spacious skies,
For amber waves of grain,
For purple mountain majesties,
Above the fruited plain;
America! America!
God shed His grace on thee,
And crown thy good with brotherhood,
From sea to shining sea.

O beautiful for pilgrim feet,
Whose stern, impassioned stress
A thoroughfare for freedom beat
Across the wilderness!
America! America!
God mend thine every flaw,
Confirm thy soul in self-control,
Thy liberty in law!

O beautiful for patriot dream
That sees beyond the years
Thine alabaster cities gleam,
Undimmed by human tears;
America! America!
God shed His grace on thee,
And crown thy good with brotherhood,
From sea to shining sea.

THE LYNN RANGE OIL BURNER

- the most modern
- simplest in construction
- easiest installed
- easiest cleaned
- silent — odorless — clean

A welcome service that saves time, money, labor and fuel in every kitchen.

DEALERS!

Write us for complete information about our generous sales plan for this fast-selling, profit-making, easily serviced Range Oil Burner.

Made, sold and guaranteed by one of New England's largest and oldest manufacturers of high grade machinery.

Help -to keep the wheels turning!

SUMMER days demand the utmost from your farm equipment. Tractors, automobiles, trucks and farm tools of all kinds are in constant use, doing the hardest sort of work. This means that you must take every precaution to prevent breakdown and have a source of supply where you can quickly get repair parts that keep the wheels turning.

When you find the "Farm Service" Hardware Store nearest you you have found that source of supply—a dependable store that will make every effort to give you the service you need.

We are money-saving stores, too, for our goods are sold to you on the basis of highest value in order that your money will buy a hundred cents' worth of value for each dollar and the extra profit of personal service. You will like to buy at our stores with the "tag" design in the window.

Check up now on your supply of oils and greases for summer use and come to your nearest "Farm Service" Hardware Store for them. You will save money here.

Look for
this tag
in their
window.

A.A.'s Western New York Farm and Home Talk

Give Farm Relief Law Fair Trial

THE so-called "farm relief" bill, officially known as "The Agricultural Marketing Act" has now become law and will soon permit functioning under it. Like many other laws it is more or less of a mixture of good and bad provisions. I have been one of those who have been more or less critical of some features of the act. Any legislation which attempts to enhance prices or to manipulate the crop surpluses directly, is dangerous and likely to fail. On the other hand, those features of the bill which provide for the organization of farm marketing on a co-operative basis and for the study of the problem and the spread of education in cooperation are excellent.

M. C. Burritt

Now that the act is law I think that everyone should at least not obstruct its functioning so that it may have a fair trial. And there will be many things that growers can do to cooperate to put the provisions of the bill into operation in respect to their own commodities and regions, as for example, in forming the commodity advisory committees and in qualifying for loans. It is probable that the new Board will first attempt to organize the grain and cotton commodities before it does anything with fruits and vegetables. Eastern farmers will probably be able to see the machinery tried out on these products before it is applied to their own.

President Is Sincere

One of the most common answers to the critics of the bill has been that it was President Hoover's own plan to improve the agricultural situation; that he was absolutely sincere; that he had accomplished much along similar lines for commerce and trade; that he would select a strong, sympathetic, competent Board, and that all ought to give the plan a fair trial, especially since practically no progress had been made in meeting the situation during the last five years of agitation. The President has apparently made good in the appointment of the Board as far as announced at this time. He has not selected any of the hundreds of candidates, political and otherwise, but has sought out men who were not seeking jobs. In Stone of the Tobacco Growers, Teague of the Citrus Fruit Growers and Denman of the Livestock Producers, I believe the President has secured the very best talent in farm marketing problems in America. If the others come up to their standard much good will come out of the agricultural marketing act of 1929.

More Than We Can Do

Late June and early July is a most strenuous period with us. Haying, cabbage setting, cultivation, spraying, berry picking, all push us to the limit. Any farm that is being operated as a business proposition, is bound to have its periods of congestion. One is always confronted on the one hand with the problem of keeping his business balanced, his work distributed so that he can handle it, and on the other, with the necessity of utilizing his labor to the full at all times and with maintaining a maximum gross income. If he does the latter, he will probably have periods when he has more than he can do. We are in one of those now. The weather has been with us and we have turned off a lot of work. We have set 65,000 cabbage and cauliflower plants, got our codlin moth spray on on time, have one field of alfalfa in the barn and cultivation in

good shape, besides handling a heavy

crop of strawberries. Another week of good weather should see us nearly caught up again. Although it is still a little too dry in spots, on the whole growing conditions have been quite favorable and all crops are looking well.—Hilton, N. Y., July 7, 1929.

Early Potato Crop Smaller Than Last Year

"We would appreciate any information you have as to prospects for the potato crop next fall. How does the acreage planted compare with last year and what will be the probable production?"

IT is a little early yet to do much more than guess as to the final production in late producing states. However, there are a number of signs which point to a much more favorable situation than we had last year.

Ordinarily, the early potato producing sections do not seriously interfere with each other. By the time one section is ready to ship, states farther south have completed digging. A year ago, however, there was serious interference which resulted in a low price for early potatoes. When early potatoes in one state were ready to dig, growers were inclined to hold off for better prices and as a result, they found themselves in competition with areas farther north. This condition continued through the summer and had a serious effect on prices in the late producing states. In our July 20 issue last year, we reported that the top price for early potatoes from Virginia was \$1.63 and \$1.75 per barrel. As compared with that, the best early potatoes are bringing around \$4.50 per barrel at present.

According to a recent U. S. D. A. crop report, the eight second early potato states have an estimated acreage of 11,593,000 bushels which is a reduction of 6,400,000 bushels below last year's acreage in the same states. It is reported that New Jersey is likely to have a crop of 5,800,000 bushels as compared with 7,290,000 bushels last year. The entire early potato crop is estimated to be 39% below the 1928 crop.

Dynamite Put This Field To Work for Us

(Continued from Page 3)

orchard remaining. In the place of the usual harvest of a few berries and a couple of rabbits we had a crop of corn that averaged 75 bushels to the acre, which paid for the cost of cleaning up the orchard, besides leaving us a field that has since never failed to produce a crop.

While working with dynamite that spring, we also decided to take out an old chestnut tree. After cutting it down we found it was hollow up the trunk for 10 to 12 feet. The log measured 8 feet across the stump and was practically worthless. It was a problem to know what to do with it. So we decided to blow it to pieces. We tied 13 sticks of dynamite in a neat package, attached a length of fuse and I crawled inside the log pushing the dynamite on ahead until it was put in the proper place.

While we were not certain of the results we took a chance. Before lighting the fuse, we wedged the hole in the log full of heavy limbs trusting that the force of the charge would not come out the same way it went in. When the charge was set off, much to our surprise the huge log weighing many tons had been torn to pieces that could be easily handled.

The stump was treated in the same manner and before the summer was over no one would have ever known that a tree had stood in that field for upwards of one hundred years.

cows Thrive

on

B-B 20% Hi-Test Dairy Feed

EVEN with green pastures, cows need a balanced ration for top-notch milk production. And with pastures slowly drying up, they need this balanced ration more than ever.

Feed B-B Hi-Test Dairy Feed now. This economical 20% protein feed contains everything a cow requires—a variety of minerals, vitamins and other needed milk producing ingredients.

We Guarantee Most Production

The perfect balance of B-B Hi-Test insures a longer lactation period and perfect physical condition. Feeding it now means maximum production both now and later on.

We guarantee B-B Hi-Test Dairy Feed most productive per dollar of feed cost—or money back. Maritime Milling Co., Inc., Buffalo, N. Y.

This Pennsylvania Herd Is Abortion-Free

(Continued from Page 3)

expense was more than met within two years by the increased profits from the herd.

The Necessary Steps

The steps in a herd clean-up based on the Pennsylvania plan and as followed on Penshurst farm are:

1. Mark each animal by tattoo or otherwise so that unquestioned identification may always be made.
2. Make a complete list of the herd showing tattoo number or other identification mark and breeding record of each cow as far back as possible.
3. Engage the services of a reliable veterinarian who has had experience in blood testing or who at least is fair-minded and a careful operator.
4. Have the veterinarian make arrangements with the Bureau of Animal Industry for the testing of the blood samples. The Bureau will furnish him with necessary test tubes and blanks for listing the animals which have columns for recording the number of test tube and identification mark of the animal. Each test tube carries a number plainly marked on its side.
5. The veterinarian will draw a sample of blood from each animal and empty at once into the test tube. The needle is thoroughly washed between the taking of each sample. An experienced operator with competent assistants can take 30 to 40 samples in an hour. It is one man's work to see that each test tube is properly numbered and that the number is entered on the blank opposite the identification mark of the animal.
6. The samples are now sent to the State Laboratory of the Bureau of Animal Industry for diagnosis and a copy of the list sent with them. The samples in the laboratory are known only by number and if the record is not absolutely correct the test cannot mean anything.
7. The Bureau report will be received in a few days showing which animals are positive, which negative and which suspicious. This report is usually accompanied by a recommendation as to when retests should be made.
8. If positive or diseased animals are found they should at once be separated from the negative or healthy animals and the entire stable disinfected. Constant watch should be kept for signs of the disease in the healthy or negative herd and should even a slight sign or symptom appear isolate the animal at once. Should an abortion occur remember that all discharges from the cow are loaded with disease germs or Bang Bacilli which will readily infect negative animals. Remove the animal at once from any possible contact with the negative herd. Disinfect the place where the cow aborted and burn or bury the foetus and any material which may have been touched by the discharges. The essential thing is to prevent any discharge from the uterus of an aborting cow coming in contact with the mouth of a healthy cow.
9. Retest the herd every two months and promptly remove any positive or suspicious animal. From the time of the first test use every precaution to prevent infection from gaining admission from outside sources. No animals should be added to the herd unless proven by the test to be free from the disease and, even then, unless the test was very recent, all animals added to the herd should be kept under quarantine until after a retest.
10. If the herd has been signed up on the accredited herd plan of the Bureau of Animal Industry the Bureau will issue a certificate after a sufficient number of clean tests have been made to satisfy them that the herd is actually disease-free. Re-certification or continuing certification is based on an annual retest without reactors.

Time Required Varies

The length of time necessary to rid a herd of the disease cannot be definitely stated or perhaps not even ap-

Helping Hands in the Poultry and Dairy Businesses

Do you ever get stumped? Does any perplexing question relating to disease, management, breeding or feeding ever come up that you are unable to solve? Then tell your troubles to the Park and Pollard Service Department.

To help you we have at our command a store of data collected from sources all over the world. Our own original study and experimental work has also provided much information that might be of assistance to you at some time or other.

The men who make up this department are highly trained in the science of animal husbandry. More than that, they have a background of practical experience that enables them to give helpful advice on almost any question.

In aiding you we will be aiding ourselves—gaining new experience and at the same time doing our bit to make your business more profitable. And on your profits depend our own.

It was the desire to be helpful to the poultry and dairy industry that caused us to inaugurate this department.

The same desire is responsible for our research laboratories and experimental farms. These help to develop newer, more productive feeds and improve the health of the birds and cattle.

Like everything else in the Park and Pollard organization, these departments are a part of our policy of "helping others to help ourselves."

Reviewing the Latest Eastern Markets

Milk

The following are the July prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		1.95
2A Fluid Cream	2.16	
2B Cond. Milk		
Soft Cheese	2.41	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese, Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

* * *

June Prices Announced

The Dairymen's League announces the following pool prices for June for 3.5% milk.

Gross	\$2.33
Expenses	.06
Net Pool	\$2.27
Certificates of Indebtedness	.15
Net Cash Price to Farmers	\$2.12
June 1928, Net CASH Price, 3.5% milk	\$1.91
June 1928, Net POOL Price, 3.5% milk	\$2.06
June 1927, Net CASH Price, 3.5% milk	\$1.98
June 1927, Net POOL Price, 3.5% milk	\$2.13
June 1926, Net CASH Price, 3% milk	\$1.66
June 1926, Net POOL Price, 3% milk	\$1.81

The Sheffield Producers announce the cash price to producers for 3% milk in the 201-210 mile zone, as \$2.30 per hundred, (\$2.50 for 3.5% milk).

June 1928 price to producer, 3% milk, 2.12 1/2; 3.5%, \$2.32 1/2	
June 1927 price to producer, 3% milk, \$2.22; 3.5%, \$2.42	
June 1926 price to producer, 3% milk, \$2.12 1/2; 3.5%, \$2.32 1/2	

Heavy Supplies and Hot Weather Depress Butter Market

CREAMERY SALTED	July 12, 1929	July 5, 1929	July 13, 1928
Higher than extra	42 1/2-43	43 -43 1/2	45 1/2-46
Extra (92c)	42 -	42 1/2 -	45 -
J4-91 score	38 1/2-41 1/2	39 -42	41 1/2-44 1/2
Lower G'ds	38 -38 1/4	38 -38 1/2	40 -41

The slight improvement that we looked for in last week's report did not materialize. The heavy supplies proved too much for the trade and the advantage that had been gained on the 5th was lost. All during the week ending the 13th receivers have been following a free selling policy preferring to keep stocks moving.

According to the U. S. Department of Agriculture report released Friday afternoon, total stocks in the United States on July 1, together with the final figures for June 1, were as follows:

	July 1 Pounds	June 1 Pounds
1929	91,911,000	28,369,000
1928	69,750,000	15,952,000

Excess 1929.....22,161,000 12,417,000

In addition to the heavy supplies New York experienced another spell of

extremely hot weather. Temperatures were not abnormal but the humidity was unbearable and simply sapped the life out of the market. At the same time the hot weather had its effect on the consuming trade, cutting down the amount of butter going into distributing channels. All in all the market did well to hold its own. At this writing there is just a slight undercurrent of uneasiness.

No Change in Cheese

STATE FLATS	July 12, 1929	July 5, 1929	July 13, 1928
Fresh Fanyo	23 1/2-25	23 1/2-25	25 1/2-26 1/2
Fresh Av'ge			
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	30 -32
Held Av'ge	25 1/2-26 1/2		29 -30

There has been no material change in the cheese market since a week ago, when we reported the fact that Western cheese was causing some uneasiness here in the East. At the decline the market seemed to hold fairly

Market Reports Daily by Radio

Up-to-the minute market information and prices are broadcast daily for your benefit by American Agriculturist co-operating with the New York State and Federal Departments of Agriculture, through station WEAJ. The reports are broadcast at 12:30 standard time.

steady although comparatively little business was consummated. Cured New York State flats are meeting a good demand and they are holding the market steady. There is comparatively little movement in fresh State flats but few are coming forward which is just as well considering the market. On the 10th fresh makes were having a little better movement out of the West but at the end of the week trade had quieted down. The excess in storage over last year still works against any price improvement.

Hot Weather Curtails Egg Production

NEARBY BROWNS			
Hennery	37 -42	36 -42	36 -38
Gathered	32 -36	32 -35	30 1/4-35

Egg production is slackening off due largely to the extremely hot weather that is prevailing in nearly all producing sections. While receipts in New York have been holding up fairly well during the last few days, there has been an active market with prices slightly higher and there is a feeling throughout the trade that the period of heavy production throughout the middle west is now over, and that the expected long season has been somewhat of a disappointment to certain groups in the trade.

There has been an active market for eggs showing high quality, but with the extreme hot weather many lots have shown the effect of the high temperatures and this made fancy eggs rather scarce. The tendency of the market is toward higher prices on all grades and the market is in a better position than for several weeks.

Cold storage holdings are gradually decreasing due to an unusually early withdrawal. Eggs are now going out of storage at double the rate of this time one year ago. The market is very optimistic at this time and if producers can maintain quality, they are assured of fair prices throughout the balance of the season.

There are some speculators still putting away eggs anticipating higher prices. We have recently been talking with dealers who anticipate a forty-five cent storage egg market in August. It is expected that this will bring out many lots of eggs and may have a tendency to hold down the price for fresh eggs during August and September. However, with the acute shortage of held goods compared

with last year, it will require an unusually heavy late summer consumption to materially affect the market for fresh eggs.

Live Fowls Higher; Broilers Lower

FOWLS	July 12, 1929	June 28, 1929	Last Year
Colored	-35	-32	-28
Leghorn	-34	-30	23-27

TURKEYS	25-35	25-35	
DUCKS, Nearby	22-25	20-25	20-23
GESE	16-17	16-17	

The live poultry market worked two ways this week. Express fowls have been in the sellers' favor. On the other hand, broilers have been in excessive supply and it became necessary to reduce prices to a point where a clearance was possible.

The freight market has had its own troubles. It has been taking some clever merchandising to release the cars and at the same time to prevent a glut. Broilers are in extremely heavy supply from the West and have been hard to sell. They have been responsible for the extreme pressure and the trend is downward.

Fruits and Vegetables

Arrivals of Hudson Valley Black Caps and gooseberries were again very limited throughout the week and price changes were few and small. Red currants, however, were in plentiful supply and values were barely sustained daily. Huckleberries have commenced to arrive sparingly. Oswego County strawberries were in moderate receipt. Good quality, large berries sold promptly at a slight price advance toward the close of the week.

Receipts of sweet and sour cherries were fairly liberal from the Hudson Valley this week. Prices tended downward on sweet cherries especially on small and unattractive quality offerings. Sour red cherries ruled steadier on fancy large. Black sour cherries have started to arrive in small volume.

Raspberries continued in rather light receipt from the Hudson Valley and values on fancy large tended upward toward the close of the week.

Black Caps:—Hudson Valley: per pint basket, best 15-18c, few 20c; poorer 10-12c.

Cherries:—Hudson Valley: per quart basket, sweet varieties, white 10-15c, red 12 1/2-18c, black 15-20c; per 4 quart basket, sweet varieties, red 50-75c, black 50-90c, white 35-60c; sour cherries, per quart basket, red 15-20c; black 18c-22c; per 4 qt. basket, red 50-85c, black 60-85c; per 12 quart basket, red \$1.75-2.50, black \$2.25-2.50; bulk stock, various sweet varieties, red and black (18-20 pound boxes) \$2.50-\$3.00; (12-16 pound boxes) \$1.75-2.50; (eight pound boxes) \$1.00-1.50.

Currants:—Hudson Valley: various varieties, per quart basket, red 10-15c, mostly 11-13c, black 25-30c.

Gooseberries:—Hudson Valley: various varieties, green, per quart basket, fancy, large 20-23c, medium 15-18c; per 4 quart basket 60-85c.

Huckleberries:—Hudson Valley: per quart 25-35c.

Strawberries:—Oswego County: per

quart, various varieties 20-35c, mostly 20-30c, some very poor sold down to 15c.

Raspberries:—Hudson Valley: various varieties, per pint basket, mostly 20-25c, few, fancy large 28-32c, poorer 15-18c; New Jersey, per pint 15-25c.

Fava beans made their season's first appearance from Madison County, New York this week while the Hudson Valley forwarded their first wax beans. Orange County has commenced to market cut beets and carrots. Celery prices declined during week. Supplies were liberal and the outlet appeared to be restricted, doubtless due to the hot spell. State, Big Boston lettuce was in liberal receipt. The bulk of the offerings were poorly headed, more or less tip burnt or showed other defects. The demand for that kind of lettuce was exceedingly light and values ranged widely. Fancy stock, however, was in demand.

Green pea prices slumped sharply in a weak and sluggish market during the fore part of the week. On Friday, however, the situation was slightly improved. Supplies were moderate. Romaine, when fancy and large sold readily at about unchanged prices. Spinach has increased in volume from nearby gardens and prices have declined.

Trend of the Farm Markets

Special to American Agriculturist from Market News Service of the Bureau of Agricultural Economics, U. S. Department of Agriculture.

Washington, D. C.—Main features so far this month are the upward price tendencies of most grains and the animal products. Many other lines at least hold the levels of recent weeks. Crop conditions are favorable in a general way and midsummer farm prospects look far better in contrast with the depressed conditions prevailing at the end of the spring months.

Carlot movement of new potatoes from all States was at the rate of about 1,000 cars daily the first 10 days of July. City sales of eastern Cobblers were mostly within a range of \$3.75 to \$5.25 per barrel, while the Chicago carlot market was strong on good Triumphs from the Middle West at \$2.75 to \$3 per 100 pounds. Yel. Hominy supply still were California, Washington and New York State, but total shipments were light. The Colorado season is greatly delayed.

Good summer apples are jobbing generally at \$2 to \$3.25 per bushel basket.

After the slight decline in butter early in July, there was improvement in buying interest, but trade was far from active. The into-storage movement continued heavy in spite of the slightly lowered trend of prices. Storage holdings in the entire country on July 1, are estimated by the trade to be 20 to 22 million pounds heavier than those of a year ago. It is generally conceded that conditions are very good for a heavy production of butter for the coming few weeks.

Reports indicate somewhat rapid decrease in egg production and prices have moved to slightly higher levels on fresh eggs.

Beef cattle trade was active at the advance, and a new July top of well above \$16 was established at Chicago.

Shipping demand for market hogs showed seasonal expansion at rising prices and such orders were fairly well distributed among the various weight averages. Well finished hogs predominated in the supply, lightweights and pigs being scarce. The percentage of grassy hogs was unusually light for the season, but sold at sharp discounts under well finished kinds.

The bulk of fat range lambs went at \$14.75 to \$15, natives \$14.50 to \$15 and fat ewes \$5.50 to \$6.50 at Chicago the first week of July. Trading on the Boston wool market was rather slow and limited generally to small quantities.

Grain markets advanced sharply during early July, influenced by continued unfavorable prospects for spring grains in the United States and Canada and unfavorable seeding conditions in the Southern Hemisphere.

The new corn crop is very uneven and varies from one to four weeks later than last season in different areas. Higher prices have slowed down the demand.

Prices of feeds generally advanced with a fairly active demand for the small supplies. Demand for cottonseed cake and meal was dull, but inquiry for linseed meal exceeded the light offerings and the market became somewhat firmer. Corn by-product feeds were higher, especially hominy feed.

Timothy hay markets were influenced by the liberal offerings and limited demand and prices were slightly lower at most points.

Farm News from New York

First Payments of Gasoline Tax to Counties--County Notes

WE HAVE been very enthusiastic over what the new road and school laws that were passed by the legislature last winter would do for farm taxes and better schools and roads. But no doubt a lot of farmers have been rather skeptical and have not allowed themselves to get enthusiastic until they began to see results. Well, here are some tangible results.

One of these laws put a tax of two cents a gallon on gasoline and provided that 20 per cent of the gas tax should be returned to the counties for building county roads. About \$1,500,000 of this gas tax is already in the hands of the State and of this first collection the counties will receive \$277,722.15, each of these counties receiving a sum depending upon its road mileage. In the table below we give what each county will receive for the building of county roads from this first collection of the gasoline tax.

This is only the beginning. It is estimated that the counties will get a total of \$4,800,000 this first year from the gasoline tax. "The proof of the pudding is in the eating."

The table follows:

County	Road Mileage	Amount Received
Albany	886	3,485.00
Allegany	1,718	6,757.59
Broome	1,258	4,948.23
Cattaraugus	1,792	7,048.67
Cayuga	1,293	5,085.89
Chautauqua	1,737	6,832.33
Chemung	779	3,064.12
Chenango	1,541	6,061.33
Clinton	1,205	4,739.76
Columbia	1,234	4,853.82
Cortland	912	3,587.27
Delaware	2,120	8,338.82
Dutchess	1,398	5,498.90
Erie	1,946	7,654.41
Essex	1,055	4,149.75
Franklin	1,172	4,609.95
Fulton	646	2,540.98

accompanist will not be considered in judging contestants.

The judges are to be County Agent R. W. Pease and Mrs. D. P. Witter.

The New York State Fair has appropriated \$400 for prizes to the winners of this contest. It has been decided to divide these evenly among solos, duets, trios and quartettes.

The contests will be held in the Memorial Room of the Daniel Parrish Witter Agricultural Museum. Solos will be heard at two P.M. on Tuesday. The prizes for solos are as follows: First, \$25; second, \$20; third, \$15; fourth, \$10; fifth, \$5.

Duets will be heard on Wednesday, and it will be possible for those who competed in the solo contest to join with others who are members of the above mentioned organizations and from the same county in this contest. The prizes for duets are as follows: First, \$30; second, \$25; third, \$20; fourth, \$15; fifth, \$10.

On Thursday trios will be heard, and any previous contestants may enter this contest, with the same restriction above mentioned. The prizes for trios are as follows: First, \$30; second, \$25; third, \$20; fourth, \$15; fifth, \$10.

On Friday quartettes will be heard, and previous contestants may enter this contest. Prizes for quartettes are as follows: First, \$40; second, \$30; third, \$20; fourth, \$10.

In any combination of singers, such as quartettes, it is understood that those composing the combination must be members of some organization belonging to the three groups above mentioned. In

this way, all will be residents of the same county. This, however, does not apply to Granges when membership extends into an adjoining county.

Those who enter the contest should notify Mr. D. P. Witter, Berkshire, N. Y. in writing not later than August 20th, and at that time should give the name of the organization of which each contestant is a member. The prizes will be paid to the individuals winning the contest.

Prizes will be awarded at the end of each day; that is, the winners in the solo contest will receive their awards Tuesday night at the close of the contest, etc.

Shilling Appointed To Federal Farm Board

THE sixth member of the Federal Farm Board recently appointed by President Hoover, is Mr. W. F. Schilling of Northfield, Minn. President of the Twin City Milk Producers Association. The position was recently offered to Mr. W. S. Moscrip of the same organization, who declined on the ground that he could not give up his farming interests to take the post. It is stated that plans are under way to have the first meeting of the Federal Farm Board at Washington on July 15th, even though the appointments to the Board have not been completed at that time. Those who have accepted appointments on the Board up to date are: Mr. Alexander H. Legge, President of the International Harvester Company;

New York County Notes

Chautauqua County—Farmers are trying to hay but with rain most every day, it is slow work. Crops have come on so that most of them are better than usual at this season. Corn especially has made a good stand and with favorable weather for the next two months will make a good crop. Old meadows are weedy and there is a light crop. Otherwise the hay crop looks good. All we need is good weather. Pastures are good but milk is shrinking as it is liable to at this season. I think more cows than usual will freshen in the fall.—A.J.N.

Genesee County—The cost account group at the Farm Bureau will hold a dinner meeting at the "Applewood" near Stafford. Farmers of 47 farms in Genesee are keeping track of all the money spent or gained on their farms. So far this is the only Cost Account Group in the state. Agents from several Farm Bureaus are expected and summaries of each farm enterprise will be presented at the meeting. Lettuce shipping has begun at Elba. It is bringing a good price this year. Farmers are still sowing buckwheat and setting out cabbage plants.—Mrs. R.E.G.

Cortland County—Haying has been very difficult so far this season. A considerable amount of clover has been cut in the past ten days most of which has been nearly ruined by continuous rain. The 4-H Club is making very good progress in the county this summer. About 75 attended the annual Junior Field Day at Ithaca, June 26-28. Nearly every boy and girl reported an enjoyable time.—W.N.G.

Cayuga County—Since the hot spell in June we are having very unsettled weather. Some few farmers cut early hay, clover and daisies at that time and secured it in excellent condition and quality. Personally, I have my haying half done but must stop to cultivate and spray potatoes and corn only 6 inches high. Wheat is looking fine and oats are coming along fairly well. Black sweet cherries are ripe and plenty of birds to strip the trees as usual. Hens are holding production fairly well though the hot spell was tough on them. Local prices for eggs 34c, shipping prices 40c and better.—A.D.E.

Yates County—Middlesex Valley leads the way for early harvest. Winter barley was cut on the Washburn Farms fully ripe. The seed came from Maryland last fall. Bean planting is over. The stand is good. A big clover crop is being taken care of. Wheat is beginning to turn. The price is advancing. The June drop of apples has been heavy and the crop will be light. Early pears are being cut and taken to the canners. The crop is light. Spring lambs are beginning to be marketed at 14c, weight 70 to 85 pounds.—L.C.W.

Tioga County—Field Day of the Tioga County Farm and Home Bureau was held June 29 at the farm of Harry W. Petzold near Weltonville and although the weath-

er was not as favorable as was desired, was a decided success in every way. Over 800 from all parts of the county were present. Mr. Petzold donated a fine young calf which was auctioned off, to aid in defraying the expenses of the day and it sold for \$50. L. A. Fisher also gave a calf to be drawn by number, which was won by Alfred Austin. Field sports were engaged in and milk products were sold. The day passed all too quickly. The cattle judging number under the supervision of Prof. Wing of Cornell had more than a dozen contenders.

Tioga County has lost one more of its large feed mills and its loss cannot well be estimated in dollars. Fire of undetermined origin broke out in the cupola of the Seeley mills at Spencer and chemicals failed to extinguish the flames. The loss in money value is between \$75,000 and \$100,000. This makes four of this company's mills to be burned in several years past. Fire apparatus was sent to aid from Owego, Ithaca, Candor and Van Etten. Water was not to be had and chemicals availed but little in subduing the flames but did save the condensary and many other buildings for which all are truly thankful. C.A.A.B.

Orange County—There is a large hay crop and exceptionally good weather so far for gathering it. The 4-H Club Camp will be held this year near Burlington, Sullivan County, under the direction of Y. D. Musser, and the girls group opens camp July 22. Over 30 registrants already in each group.—C.E.H.

Columbia County—Two thunder showers the past week. Lightning hit the church belfry at St. Sylvia's in Madalin. The W. C. T. U. in Claverack makes bags for soldiers and sailors. Philmont High School graduates were honored by Gov. Roosevelt who gave an excellent address in which he recalled his campaign days in Columbia County. The Kinderhook Garden Club had a fine display of flowers in the flower show. Charter Member Night was held in the Kinderhook Grange. Twenty-six years ago it was organized. Ninety-three quarts of strawberries were picked by an Elizaville lady in one day. Wednesday the Taghkanic Grange was dedicated. Eggs are 36c a dozen.—Mrs. C.V.H.

Saratoga County—July 4 was the coldest in many years with frequent showers. Friday was a very rainy day. Some hay is cut but not much is in the barns as such frequent rain is holding back both haying and cultivating. Corn looks good for such a bad season. Some report that potato seed rotted in the ground. Strawberries are nearly gone. Rain damaged the crop and they are cheaper than usual. Cherries are ripening and are plentiful in some sections. Roses are blooming more profusely than in many years. The rose garden of Lee Martin is attracting people for miles. Broilers and hens are being marketed. Eggs are 34c.—Mrs. L.W.P.

Mr. James C. Stone, President of the Burley Tobacco Growers Cooperative Association; Mr. C. B. Denman, President of the National Live Stock Producers Association; Mr. Carl Williams, editor of the Oklahoma Farmer-Stockman; Mr. Charles Teague, president of the Farmers Legislative Committee of California.

Orange County To Start a Dairy Record Club

ORANGE County dairymen are planning to start a dairy record club as a special project of the Farm Bureau. This club will be similar to the Wisconsin plan of testing cows by mail, but will be somewhat modified. The farmer will weigh each cow's feed and milk once a month. Milk samples will be sent by mail to the Farm Bureau Office. Here they will be tested for butterfat and the records figured up and sent back to the farmer. These records will be an excellent basis on which to plan feeding practices and also on which to cull out the low-testing, low-producing cow. Orange County will be the first to start this dairy record club in the east and can well be proud of the work it is starting.—C.E.D.

This Pennsylvania Herd Is Abortion-Free

(Continued from Page 7)

proximated for so much depends upon the amount of infection in the herd before the first test, how successfully new aborters are kept from spreading infection, and how carefully essentials are observed all along the line.

Without the blood test it is not possible to eradicate the disease for there is no other known way of detecting the disease in cows which do not abort and yet are infected and so are disease carriers and disease spreaders.

It is always desirable to have maternity or hospital stalls in a building away from the stable where the cattle are kept. The cow after calving remain there until in fully normal condition and the stall then cleaned and disinfected before being occupied by another cow. This makes easier the control of any trouble that might develop.

It is possible to raise a clean herd from reacting animals for most calves from infected mothers are born free from the disease and will not react unless infected later from outside sources.

The presence of the disease in a herd usually causes very serious losses from lessened milk production and loss of calves and breeding difficulties. The cost of a clean-up is usually recovered in the increased returns from the herd in a very few years and often within two years.

Demand for Healthy Cattle Increasing

The demand for abortion-free cattle is constantly increasing and many, if not most, breeders of pure bred cattle, when making purchases, demand a certificate showing the animal to be free from the disease or else buy only subject to the test. Prices are very materially higher than for cattle untested or in uncertain condition. Thus it is seen that eradication of the disease from a herd greatly enlarges the market for surplus cattle and increases the price.

Quoting from Dr. Deubler we have the following general summary of a practical clean-up plan. "Blood testing, the elimination of reactors, practice of sanitary measures and prevention of re-introduction of the disease is the essence of the only known plan that will completely eradicate the disease from a herd."

The results secured in Pennsylvania in the complete eradication of abortion or Bang disease from numerous herds would seem to attest in a convincing way to the soundness of the plan of the Pennsylvania Bureau of Animal Industry under which the work is carried on. Testing is being done in more than 2000 herds of which more than 300 have signed the agreement with the Bureau leading to an accredited certificate. On March 15, 1929 accredited certificates had been issued to 120 herds in the state.

State Fair To Have Singing Contest

A SINGING contest will be held at the New York State Fair, in which only members of the Farm Bureau, Home Bureau and Grange will be contestants.

In order to be eligible, one must have been a member of one of these organizations for at least four months prior to September 1st, 1929. Songs must be confined to those written prior to 1900, and in judging, 60% will be credited for execution, and 40% for costume and song. It is the intent to have costumes representative of the period in which the song was written or prior to that date.

An accompanist will be furnished those who desire, or any contestant may play his or her own accompaniment or bring someone with them for this purpose. The

For Harvest Crews Must Eat!

Careful Planning Reduces Much of the Last-Minute Rush

"W E'LL have the threshers next week," Mother used to sigh.

Everyone within hearing echoed her sigh. Threshers, even a generation ago, meant back-breaking drudgery for the woman of the house, who had to cook the heavy meals they demanded, wash the dishes after them, in addition to her other work. Threshing always seemed to come just when Mother was in the midst of canning and pickling.

With modern conveniences, cooking for a harvest crew has lost much of its darker aspect. It means added work, but with careful planning, it need not be too wearisome.

One should know a day or so in advance of the time the crew is expected, and labor in that time in preparation for the "big time" coming.

In the days preceding threshing, make a crock full of cookies, and some cakes that will keep well—potato cake, apple sauce cake—any cake containing fruit, which will improve with age. A quart or two of salad dressing is a good standby. Pie shells may be made and stored away. Apple sauce or other sauce may be cooked and put in fruit jars or sealed, if it is to be kept any length of time.

With these preparations completed, the chief worry remaining is about the meat and vegetables that the hearty appetites of the harvesters demand.

The noon meal must always be the heavier one, and for it one might prepare, on the first day, a large beef roast. Make plenty of gravy. The remaining meat may be sliced cold for suppers, made into stew or reheated in gravy.

Pot-roast is a general favorite with harvest crews. Roast pork with dressing and hot apple sauce is always enthusiastically received.

Vegetables are the most difficult problem, I have found. Some threshers will eat almost all vegetables. Sometimes a bowl of the most delicious string beans or green peas will go untouched. I always serve two cooked vegetables in addition to potatoes and a salad vegetable. This provides a choice for the men.

I prepare vegetables in advance,

ing, tartar sauce; mashed potatoes, creamed peas, buttered carrots, lettuce salad, cake a la mode.

Supper: Macaroni and cheese, sliced tomatoes, chocolate tapioca pudding and cookies.

Dinner: Roast pork, dressing, hot apple sauce, scalloped summer squash,

"Hanging Out the Clothes"

"Along came a blackbird, and pecked off her nose." This handy laundry bag shows the pert little maid in the garden, and the black bird as well. This comes ready stamped on 27 inches of 36 inch wide, blue linen-like suiting, a round thread weave in fast color with coral pink and black applique patches.

The letters, her hose and a ruffle, are white, clothes-line and a bit of the bird's wings coral red, and the rest black. Bag and parts is number 107 at 50 cents complete postpaid. Thread is 10c additional.

Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

creamed cabbage, cucumbers, peach pie.

Supper: Salmon salad, cold pork, hot biscuits with honey, apple sauce and cake.

Dinner: Choice of stew or chili con carne; mashed potatoes, corn on the cob, lettuce-tomato salad, lemon pie. Supper: Corn chowder, assorted sandwiches, hot gingerbread with whipped cream.

Such meals probably sound extremely heavy to those who do not understand the appetites of the workers. A choice of tea, coffee and milk is provided at all meals.

Plenty of hot water and a dish drainer help in the washing up after meals. The table is set well before the hour for the meal arrives.—I. N. Washington.

A New York Farmer Sees Bermuda

(Continued from Page 1)

cease where the British flag waved—and it did. On August 1, 1834 all Bermuda slaves became free and their former owners were paid compensation aggregating six hundred and forty thousand dollars—a tremendous sum for one little island—but after all very, very cheap as compared with the way we bungled the business thirty years later.

Another thing which I wish to say is this: that the Island seems to enjoy a particularly high standard of general economic comfort. We drove almost from one end of Bermuda to the other, covering all the principal roads and saw almost no evidence of severe poverty or want. There seem to be no hovels and even the pickaninnies playing in groups beside the roads looked well fed and remarkably well clothed.

Anyone who has been south of our Mason and Dixon's line knows that there is a sort of friendliness and courtesy to strangers such as we of the North sometimes carelessly fail to practice. Bermuda well illustrates this fine grade of friendly helpfulness. We did quite a good deal of hiking and almost always the native, white or

colored, would give us a smiling greeting as they passed. I know that if I lived there a little time, I would form the habit of calling out a salutation to every person that I met.

An Outpost of the British Empire

The governmental organization of Bermuda is interesting. Technically she is a Crown Colony. Unlike most countries of the world she has never known a change of government and during all the 320 years of her history, she has known only the English flag.

It was our own Revolutionary war which a hundred and fifty years ago taught England once and for all the lesson that the only enduring bands that could tie a colony to the mother country are the intangible ties of racial affection and loyalty. In theory Bermuda may be a possession of the Crown. In practice she is a free, self governing country, proud and happy to be a part of the British Empire. It is true that there is a Governor General sent from England but so far as law making is concerned it is well understood that his function is to sign on the dotted line. Bermuda can say with Canada:

"Daughter am I in my Mother's House
But Mistress in my own".

I suppose there is never for a moment any doubt as to the enthusiastic loyalty of Bermuda. Twice I heard the National Anthem sung—once by the audience at the close of an evening lecture and once at the conclusion of a Rotary luncheon. I wonder if it is possible that the Britisher—wherever he lives—takes his patriotism a little more seriously than we. It seemed to me that they put a certain religious fervor into their song.

I have said that Bermuda was a very tiny country with all the forms and ritual of a great commonwealth. Hardly half as big as an average up-state New York township, it is divided into 9 parishes each one smaller than an old time school district. But each parish elects four members of assembly and these—thirty-six in all—constitute the House of Assembly which in all its procedure is closely modeled after the Mother Parliament in London, dating back to 1620, it is noteworthy as being the oldest elective legislative body in America. Indeed Bermudians assert that—save only the English Parliament itself—no elective legislature in all the world has so long an unbroken consecutive history.

We went into the Parliament House and the Sargent-at-Arms unlocked the Parliament Chamber and also showed us the great mace. This is a beautiful piece of gilded metal work, perhaps three feet long, bearing the seals of England, of Bermuda and strange to say of Virginia—this last in recognition of the fact that the early history of Virginia and the island were closely associated.

Always when the House is in session, the mace lies before the speaker's desk and the Sargent-at-Arms assured us that when he bore it in his gloved hands, even the Governor General must fall back to let it pass. The Chamber contains heroic sized portraits of George III (the George of the American Revolution) and his Queen Charlotte by the famous Romney and we were told that these are valued at 28,000 pounds—say \$140,000.

* * *

Now having said so many nice things concerning Bermuda, I am going to take this opportunity to make my one unfavorable criticism, which has primarily to do with that perennial subject of discussion, the 18th Amendment.

In order to make my viewpoint plain, let me say that I am an old-fashioned, Puritanical farmer, who both by profession and practice is exceedingly "dry." I suppose I am about the poorest possible authority on the subject of pocket flasks or the much discussed "morals of the younger generation." I know mighty little about what some people call "The Night Life" of big

cities and probably would not recognize a speakeasy even if I happened to meet one. The new Police Commissioner of New York guesses that there are some 32,000 of these institutions in his baliwick and if this statement be as much as ten percent true, it is a pretty serious situation. Furthermore, I am going to agree to a great deal that has been said relative to the lack of enforcement of the prohibition laws and the official corruption growing out of them. The truth is that we have altogether too many citizens—some of them occupying high positions—who are such unpatriotic Americans and such poor sports that they presume to decide what laws they will obey and what laws they will flout. Granting all this, I do not believe we have any thing to learn from Bermuda.

We have at least with all our laxness and failure and possibly corruption driven the liquor traffic out of

sight. Such existence as it maintains is behind barred doors and under cover

PILLOW No. 2056 on gold-colored silk rayon has a lovely washable design painted in non-fade oil paint in the modernistic manner. All that is necessary to complete the design is to quilt around the entire painted parts with a short darning stitch in black floss. Pillow when completed will be about 14 by 16 inches. Material for top and back, \$1.35. Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

of darkness. The ancient profession of the bar-keep still survives but it can hardly be said to prosper.

In Bermuda the traffic still enjoys good standing in the eyes of the law and perhaps in public approval. I cannot remember that in pre-Volstead days there was ever any such exuberant exhibitions of beverages in glass and wood as go to make up the exhibits on the principal street of Hamilton. They will tell you that this is for the edification and pleasure of the American tourists and I imagine that there is a large amount of truth in the allegation. In any case the business conducts itself like our first parents "naked and unashamed." I am quite aware that it is not a gracious thing to discuss or criticize the housekeeping of a friendly neighbor—nevertheless, in this respect at least, I insist that we order things best in the U. S. A.

Letter to Betty

Dear Betty:

How are you? My father takes the American Agriculturist. I have been looking at your pictures and reading your recipes. I like them very much. I am enclosing ten cents in stamps for one of your scrapbooks, as I too, want to learn to be a little cook. I have a nice little garden this year. This is what I have planted in it, spinach, lettuce, sweet corn, beans, beets, peas, cabbage, and carrots. I have 100 heads of lettuce set out, 3 rows of spinach and 3 rows of sweet corn.

I have a little playhouse and a little pansy bed planted around it. I have 2 rose bushes planted. I have a few strawberries back of my little house.

I must close now.

Lovingly, your friend

M. G. O'D.

SET No. B5201 in infant's size is stamped for delicate pink and white embroidery on fine white mercerized batiste. The set consists of a dress, cap, gertrude petticoat and bib. Floss included. Price of set complete, \$1.20. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

usually gathering them the night before, and getting them ready for cooking. I use a pressure cooker, and find it, with my fireless cooker, to be my greatest aid at this time.

Sliced tomatoes and cucumbers, lettuce salad and cabbage slaw are the principal salads. Few harvesters will eat any other salad.

A few menus that have won the approval of harvest crews are given.

Dinner: Roast beef and gravy, potatoes browned with the meat; string beans, buttered beets, sliced tomatoes with mayonnaise, apple pie.

Supper: Potato salad with chopped eggs, sliced cold beef, hot buttered beets, sliced peas and cream, ice-box cookies.

Dinner: Roast pork with dress-

Aunt Janet's Counsel Corner

Two Opposing Views as to Where is a Good Place to Live

DEAR AUNT JANET:

If I were given my choice of a house in the city, all modern conveniences, and a house, livable on a farm of about 60 acres, I would take the latter. We country folks have, nearly all of us at least, some of the modern labor savers and gradually are getting more. Most farmers have a car. Even the tenants have theirs although they may be "second hands". Then the trucks and tractors have simplified the work and Mr. Farmer is not too tired to drive to a nearby city to a movie or show occasionally. The wife now has running water, electric washer, sweeper, iron, then the wonderful radio. The farmers nearly all have one and there are great numbers of electric ones around us. They help the farmer market his crops at the right time and the music is restful after a hard day's work.

The city folks may enjoy their fancy salads (vegetable) but they do not have the pleasure of planting tiny seeds and watching for the first green sprout. What a thrill to go out in the morning and find the lettuce up, where there was nothing the night before!

How many city folks have ever found a humming bird's nest? Watched them feed their young and gather honey? How strong their wings must be, to be suspended in the air while gathering the honey and even feeding the young. How many have watched a rose or other flower uncloset? or watched a nest of tiny spiders making their first web? Then later find them scattered here and there and wonder where they all went to, there seemed to be hundreds.

Then all the different birds, you get to know them all by name, and when the cat brings one home you feel sad. The farmer and his wife are the busiest people on earth but they have time to see these things and many more. The

city has these things also but people are too busy hustling and bustling to see them at home, and take trips to the country to see them. Women have more chance of making "pin money" in the country than in the city, if they are not afraid to work.

I lived in the city till my marriage to a farmer. (This after I said I would never marry one as their wives have to work too hard.) I want to live in Western New York west of Rochester where the land is level and they have

and why I want to live there.—MRS. E. C. S., New York.

* * *

Florida Gets a Vote

DEAR AUNT JANET:

Where I would prefer to live and why is very easy for me to "tell the world," and it is contained in one magic word "Florida". Three years spent in the "Land of Sunshine and Flowers" made me a confirmed booster of the state and her charms. It's the ideal place to live (according to my judgment) for its wonderful climate both winter and summer. Imagine, if you can, tall palms outlined against the starry skies; sparkling lakes that seem to dare you to "come on in, the water's fine"; acre after acre of long straight rows of orange, grapefruit trees, showing bright green glossy leaves against the white, white sand in which they thrive; giant poinsettias on tall stems, nodding their brilliant heads in the breeze; the low-hanging gray moss, like nothing so much as an old man's beard, covering the water oaks; the tall old magnolias bearing their gorgeous waxy white blossoms; the golden-throated mocking birds who fill the air with their glorious music; the long leaved banana trees that rustle and sway in the wind; the white roads that wind away for miles and miles and make you want to get out old "Lizzie" and crank her up and just go and go and go; the wonderful days of just sunshine and blue skies and sudden little showers; and the nights scented with the perfume of the fragrant orange blossoms and night-blooming jasmine mingled with the songs of the birds, and the myriads of twinkling stars in a deep blue sky, and a gorgeous moon. A marvelous country where shoveling coal in the furnace, wading through snow drifts and tingling fingers and thumbs are all forgotten, a place where youngsters grow and grow and oldsters regain the spirit of youth. And those are just a few (?) reasons why Florida is my ideal of a place to live.—Sincerely, D. T., New York.

Lovely Party Frock

2864

Emb
Trans
713

DRESS PATTERN NO. 2864, although it looks so dainty and frilly, is really simple to make. It is a one-piece dress, having the gathered ruffles simply stitched to kimono sleeves and skirt of the dress along perforated lines. White voile, sprigged dimity, printed lawn, organdie or wash silks would make up charmingly by this pattern, which cuts in sizes, 6, 8, 10, 12 and 14 years. For the 8 year size, 2 1/4 yards of 40-inch material with 1/4 yard of 36-inch contrasting for bows, is sufficient. PATTERN PRICE 13 CENTS. Embroidery transfer No. 713 (blue) costs 15c extra.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk. Add 12c for one of the summer fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Avenue., New York City.

general farming. The south may be wonderful but how can they appreciate the warm weather when they never have the cold? I love to dig in my garden but it seems good when winter comes and I can get a little rest from weeds. Then by March I am planning my garden again.

Then we have the freshest of air, vegetables, fruits and meats which we can ourselves. Then the quiet peaceful evenings after a hard day's work. These are the things I like about the country

Stunning Sleeveless Model

2870

DRESS PATTERN NO. 2870 with its graceful front flounces and smart sleeveless style is simply stunning for summer when made up in the printed linens or piques. For fall wear, the silk crepes or light tweeds, using the sleeved models would fill many needs. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 3/4 yards of 40-inch material with 5 1/2 yards of binding. PATTERN PRICE, 13 CENTS.

Remember... you come first!

Save yourself!

More important than a few pennies... your own strength. With Fels-Naptha you get, not more bars, but more help... the extra help of two active cleaners combined in a single golden bar. Naptha, the dirt-loosener (smell it!) and good golden soap, the dirt-remover. These two, working hand in hand, make your washing easier. Fels-Naptha is a bargain in washday value because it saves you. Get Fels-Naptha today... at your grocer's.

LEOPOLD A. COOK,
27 W. 45th St. Bayonne, N. J.

phone companies are competing to get their wires into a new town. One of them tries to sabotage the other until Tom Mix takes a hand, rescues the pay roll and lays the last length of wire. (Story by Harrison Diago).

j—THE NEWS PARADE—Fox—7 rls.—Nick Stuart, Sally Phipps—Unusual romance of a young man who becomes a cameraman. The use of the news reel in telling his experiences makes the picture both interesting and thrilling. (Original screen story by William Conselman and David Butler).

hs—RAMONA—United Artists—8 rls.—Dolores Del Rio, Warner Baxter—A romance laid in the early days of California. Ramona half white and half Indian is brought up as the adopted daughter of a Spanish senora. She falls in love with an Indian and through the aid of her foster brother she manages to elope with him. Later her baby dies, her husband is killed and her home is destroyed in a raid on the Indian village. She is reunited with her foster brother. (Novel by Helen Hunt Jackson).

j—FLYING ROMEOS—First National—7 rls.—George Sydney, Charles Murray—Comedy of two barbers who try flying to gain the favor of a manicurist. Clever sub-titles and the picture has many laughs. (Original screen story by John McDermott).

hs—SEVENTH HEAVEN—Fox—7 rls.—Janet Gaynor, Charles Farrell—Idyllic love story—romantic Parisian sewer digger rises on the wings of love to higher things becoming a street cleaner and going off to war to become a hero through the influence of a street waif whom he protects from a criminal sister. (Play by Austin Strong).

hs—THE SMART SET—Metro—7 rls.—William Haines, Alice Day, Jack Holt—William Haines interprets another one of his smart-alec, show-off characterizations—a polo player this time who nevertheless has the goods when it comes to a pinch. (Original screen story by Byron Morgan).

j—WARMING UP—Paramount—7 rls.—Richard Dix—Baseball romance in which a small town pitcher makes a national team and also wins the girl. (Original screen story by Sam Mins).

How to Prevent Runs

1. Put hose on carefully. Turn stocking wrong side out, all but the foot, slip on the foot, roll rest over the heel gently to prevent cracking the fibres. Then draw hose up snugly but not too tightly.

2. Avoid catching hose on rings, bracelets, shoe buckles, or on furniture. Shoes should not rub up and down at the heels.

3. Wash hose properly and after each wearing. Use lukewarm water, rinse in water of same temperature. Avoid strong soap, too hot water, and rubbing soap directly on stocking.

Pictures You Want To See

(Recommended by the National Board of Motion Picture Review).

hs—High school audience
j—Juvenile audience

hs—GLORIOUS BETSY—Warner—7 rls. Dolores Costello, Conrad Nagel—Romance of the time of Napoleon. Glorious Betsy marries Napoleon's brother but gives him up for reasons of state. He sacrifices his kingdom and returns to her. (Play by Rida Johnson Young).

hs—HANGMAN'S HOUSE—Fox—7 rls.—Victor McLaglen, Earle Fox—Irish romantic story. The daughter of a hated "hanging judge" is forced to marry a waster, John Darcy whom a member of the Foreign Legion is out to kill because he has abused his sister. Darcy is burned in "Hangman's House" Castle and the heroine is free to marry her sweetheart. (Novel by Donn Byrne).

hs—HAROLD TEEN—First National—8 rls.—Arthur Lake, Mary Brian—High school story of love, theatricals and football built around the rather goofy character of Harold Teen famous through the comic strip. (Comic strip by Carl Ed).

The Plains of Abraham—By James Oliver Curwood

CHAPTER VII

NEVER had any period in Catherine's life been filled with such a variety of incidents as this Sunday in May. How men could fight and batter each other and at the same time declare themselves the best of friends, she could not understand even with her eyes beholding the truth of it. When Henri unloaded his cargo of damaged humanity, she was faint from shock. The first break in her despair came when the presence of an affectionate good cheer between the two men forced itself on her attention. Hepsibah, whose dizziness still made it difficult for him to stand, insisted that he would not lose a minute in making a new leg for Tonteur and suggested for this article a hickory bar, dried hard as bone, which Henri was saving for a shaft in the gristmill he was planning to build another year. When this stick was brought to him, the baron burst forth in a pæan of enthusiasm and declared that in all his experience he had never seen a more admirable piece of material. This Catherine observed and overheard as she looked from the corner of a curtained window, and somewhat relieved by the humour the two were in and seeing no serious damage had been done she made up her mind to act as if nothing had happened to mar the amity of the day. That her deception might be less burdened with the danger of exposure, she contrived to get Henri and Jeems into the cabin, and impressed her resolution on them.

So Tonteur was their guest at dinner, and with a great lie, which was wholeheartedly endorsed by Hepsibah, he explained the reason for their facial disturbances, their ride in the cart, and his broken peg, unconscious of the fact that Henri had rushed in to tell his wife about the combat and its results when he came for the ox.

"Wrestling, madam, is a sport of the gods," he said to Catherine, as she cut open the huge turkey pie. "I've had a passion for it since boyhood, and it ran in my family long before the day when Abraham Martin, in Quebec, offered the finest cow in his herd to any man who could put him on his back. It's my fault, and not your brother's this mess we are in. We were wrestling fair and doing it in a gentlemanly way, as your husband will make oath if you ask him, when my accursed peg-leg caught in one of the stumps in a big pile out there, and down they all came on us, until it is a wonder we are left alive! My good friend, Monsieur Adams, was caught with a hundred pounds of green oak in the pit of his stomach, and with the sickness which came of it and my having only one leg to hop on, we were compelled to avail ourselves of the services of the cart. To-morrow, Jeems, when you dig out stumps, don't make the piles so confoundedly high!"

"Why?" asked Catherine gravely. "Are you and Hepsibah going to wrestle there again?"

"It may be, madam. I am teaching him something new!"

"The devil you are!" exclaimed Hepsibah, then caught himself. "I mean," he added apologetically, "it isn't so new as it was."

When the baron left for home late in the afternoon, equipped with a new peg which pleased him greatly, he promised that he would return soon and bring Toinette with him if he could, and went off merrily with Hepsibah and Jeems, who accompanied him up the long slope to the edge of the Big Forest. There Tonteur turned and waved his hat at Henri and his wife, and after that Catherine saw him lean over to give Hepsibah a jolly thump on the shoulder and to shake hands with Jeems. While her eyes were shining at these signs

of friendship, which she believed would be permanent, the seigneur, unmindful of Jeems's presence, was saying to Hepsibah.

"I'll give your head a few days' rest, sir. Then, if you don't mind, I shall be grateful for the opportunity of trying out this new leg of mine on it. That is, if you have further desire to compete with me and we can meet where

ting tired of a game so bloody and vile and are beginning to call ourselves Americans. It's a new and wholesome name, Jeems, and one that is bound to grow. And for a like reason, because the shortcomings of a parent sometimes give birth to pride in a child, a lot of the people of your father's race are beginning to call themselves Canadians. It's six to one and

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Jeems admires Toinette and is deeply hurt by her disdain. He hates Paul Tache, Toinette's cousin from Quebec, because Paul assumes a superior air and because he is in the good graces of Toinette.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable.

Madam Bulain will know nothing of our *rencontre*. But if you have had enough——"

"I haven't begun," growled Hepsibah. "The luck o' the devil has been in that scoundrelly stick o' yours. To be struck by such a low-down instrument o' war is an insult to my nature, and in our next debate, it's my intention to lay you so cold that you'll be satisfied forever!"

Tonteur rode into the shadows of the woods, laughing as he went. When he had disappeared, Hepsibah turned to Jeems.

"I want no better friend than a man like that! he exclaimed. "A fighting man after my own heart, lad, and one it is a pleasure to debate with. If there were only more Frenchmen like him and more of our blood like myself, what pleasure we would find along the frontiers!" A thought coming to him of his nephew's adventure, he asked, "What happened when you went to Toinette? Did you see young Tache? And what did Toinette have to say?"

"I didn't see Paul Tache," replied Jeems, still looking in the direction Tonteur had gone. "Toinette called me an English beast."

What he had decided to keep from his mother he told to Hepsibah, repeating all that he had heard at the door of the manor, in such a quiet way that he might have been recounting an incident which had occurred in another life other than his own.

"They hate us because my mother is English," he finished. "Madame Tonteur said that some day we would be cutting their throats."

A few moments passed before Hepsibah spoke. In that time his face had grown dark and thoughtful.

"They were harsh words to use against neighbors, Jeems," he said then, "and hard ones to stand when pointed at those we love. But it's the nature o' the human race when divided against itself, and which mostly worships God for spite. And maybe they were right. Some day we may cut their throats!"

"Are the English—as bad—as that?" asked Jeems, seeing quickly what the other had meant.

"Yes, that bad," nodded Hepsibah, an almost imperceptible note of menace in his voice. "For more than half a century they have been hunting Frenchmen's throats to cut, and, likewise, over that same period o' time the Frenchmen have been hunting ours for the same purpose. That's why, down in the Colonies, some of us are get-

half dozen to the other when it comes to counting the blame for all the killing and burning that's going on along the frontiers, and the Indians, who started out as brave and honourable men who wanted to be our friends, have been made the instruments o' these two God-worshipping devils named France and England, who have been spattering the world with gore and hate until no mile o' land or sea is free o' the stench of their discord. So while it may be hard to bear, lad, you mustn't condemn Toinette for what she said, for you are a beast in her eyes, painted by her mother and all the French before them, but I'm predicting the time when she will see the truth as she has never been allowed to see it yet. Youth like yours and Toinette's is bound to hold the glory o' this great country in the hollow of its hand!"

Jeems's eyes were filled with a slow-burning fire, as if he were looking ahead to a vision of that day.

"If war comes, on which side are you going to fight?" he demanded. "Will you help cut the throats of Tonteur and his people?"

"God knows!" replied Hepsibah, startled by the bluntness of his nephew's question. "I've asked myself that question many a time, lad, when I've lain alone o' nights in the deep woods. As I've said before, fighting is the breath o' life when it's done with honor and discretion, but no Adams this side o' the sea has ever sunk to murder and massacre, and that's what this is going to be—until the horror of it wipes out hate and brings back reason to our brains. And so, answering you as an Adams should, Jeemsy, I'd say we must watch the ones we love and fight for them if we have to, no matter where our bullets go," and his gaze travelled sombrely over the wide expanse of Forbidden Valley.

After a brief silence, he added:

"I've asked myself who is right and who is wrong, the French or the English, and there isn't any answer, except to say that one is as black as the other. I've roved the frontiers for twenty years now, and no matter what others may say or history may write in days to come, I know the facts. I've lived and slept and fought with these facts until the truth is as clear to me as the sun out there. It's the Indian part o' what's coming that fills me with fear, and one half o' you is as much to blame for that as t'other half, Jeems, you being equally split by birth. Down in the Colonies we use

money and whisky and dishonesty on every kind to stir the Indians to madness against the French, and the French work this same evil and to the same bloody end mostly through the use o' the Word o' God. If there is anything to be said in favour of either, it's on the side o' the Jesuit Fathers, for they're a brave and courageous lot o' men, and we can't place a sermon on a level with a keg o' whisky even though it stirs up the same hell. But a scalp ripped from a human head because o' the urge o' religion is just as red as one taken through the influence of a quart o' rum. It isn't the priests' fault. They preach first and are patriots after that. But the result is identical, and so we have a mess of it, with all the Indians in the country prostituted to the selfish and criminal ambitions o' two white peoples who go to church and sing psalms and claim there is a heaven. As one who loves to fight when the fighting is clean, I can't answer your question any better than I have, Jeems. When the time comes, we'll both find our work to do."

In the days and weeks that followed, the spirit of comradeship between Jeems and his uncle grew stronger. This closer consociation with a man whose knowledge of the frontiers and their conditions was excelled by few, and who had supplemented his enlightenment by an acquaintance with the history and political strength and weaknesses of the mother countries that controlled them, gave to Jeems a scope for thought that every hour helped to broaden. With his illimitable resources of information about the wilderness world of half a continent, Hepsibah also possessed a kindly and homely philosophy which, striking deeply at the truth of many things, planted in Jeems's widening viewpoints of life constructive guideposts to the future which he was determined not to forget. To Hepsibah the intimate nearness of a growing mind and body which he loved held a greater appeal to him to remain in Forbidden Valley than his sister's pleadings, and with each day that they went out to the stump field to hew and dig, their affection became more settled and satisfying, until at last it made Jeems almost forgetful of his feud with Paul Tache and helped to heal the aching wound which had come with the certainty that Toinette despised him. Unknown to him, the question he had asked his uncle at the edge of the Big Forest and his disclosure of what he had overheard at Tonteur Manor had struck a significant note in the leather-stocking's heart, and from that time his friendship for the baron assumed a different aspect, not less warm and appreciative but free from the abandonment of personal desire which had already brought about two conflicts between them. After an open challenge and its refusal by Hepsibah on the point of his sister's feelings in the matter, Tonteur, like the chivalrous soldier he was, put a muzzle to his inclinations, and thereafter the intrepid veterans disported themselves, for a time at least, like brothers. But Toinette did not come with her father to the valley, nor did Jeems expect she ever would.

Late spring, then the beginning of summer, followed Hepsibah's arrival at the Bulain home, and still he gave no betrayal of the restlessness which presaged his usual disappearance for another long period into the fastnesses of the wild. This season of the year was always one of torment for the forest dwellers because of the winged pests which crawled the earth and filled the air, and Jeems had come to dread it as an indescribable nightmare of discomfort and suffering. The

Livestock Breeders

Watch for Tomboy and Alice

These Ayrshire cows are walking from their homes in Vermont to the National Dairy Show in St. Louis.

They are demonstrating that the modern pure bred Ayrshire is a hardy, vigorous animal, able to travel far and wide for a daily food supply, and always unmindful of the road or the weather.

Picking their pasture along the roadside these cows are maintaining full production while enduring the hardships of this 1200 mile journey.

Follow the Trail of the Ayrshire, the Heaviest Producer of 4% Milk at Lowest Feed Cost
Foundation stock cheerfully located.

FISHKILL FARMS

offer the following
Bred Heifers

FISHKILL MARTHA COLANTHA INKA
Born Mar. 20, 1927—Bred Feb. 11, 1929

FISHKILL CLOTHILDE LILA MAY
Born May 12, 1927—Bred Dec. 27, 1928

FISHKILL HENGERVELD LADY
Born Feb. 11, 1927—Bred Jan. 21, 1929

FISHKILL MAY INKA COLANTHA
Born Nov. 13, 1927—Bred Feb. 27, 1929

FISHKILL BEAUTY MAY COLANTHA
Born Apr. 7, 1927—Bred Jan. 4, 1929

FISHKILL INKA HENGERVELD
Born Dec. 9, 1927—Bred Apr. 22, 1929

FISHKILL KORNDYKE MAY SEGIS
Born May 8, 1927—Bred Jan. 22, 1929

These fine specimens of the Holstein breed are sired by FISHKILL SIR MAY HENGERVELD DE KOL. His sire is HENGERVELD HOMESTEAD DE KOL 4TH sire of a 1056 lb. cow, he out of JENNY LINN COLANTHA (30.95 lbs. butter in 7 days at 4 years), she being a grand-daughter of that greatest of all milk sires COLANTHA JOHANNA LAD, through his best son, our former herd sire, DUTCHLAND COLANTHA SIR INKA. On his dam's side FISHKILL SIR MAY HENGERVELD DE KOL'S ancestry is just as impressive. His dam WINANA SEGIS MAY 2ND (27.42 lbs. butter in 7 days at 3 years, 11 months, 14 days), is a daughter of KING SEGIS PONTIAC HERO a full brother to that "Marvel of all Sires" KING SEGIS PONTIAC COUNT whose daughters have broken over 100 world's records.

Represent Crosses of Famous Producers

FISHKILL MARTHA COLANTHA INKA—Traces twice to Colantha Johanna Lad. Her dam has a splendid record in Class B, she a daughter of Dutchland Colantha Sir Inka, sire of eighteen 30 lb. daughters.

FISHKILL HENGERVELD LADY—Out of a grand-daughter of "Old Dutch" and holder of a fine series of records (22.19 lbs. butter at 2 yrs., 10 mos., 1 day). Traces three times to Colantha Johanna Lad.

FISHKILL BEAUTY MAY COLANTHA—Out of a daughter of the great Dutchland Colantha Sir Inka. Every sire in her pedigree has a list of proven daughters and five of the dams have proven records.

FISHKILL KORNDYKE MAY SEGIS—Her dam has made an impressive series of records as a two year old, she a daughter of Dutchland Colantha Sir Inka, out of 24 lb. daughter of King Korndyke Sadie Vale 11th.

FISHKILL CLOTHILDE LILA MAY—She embodies two great transmitting families on each side of her pedigree, tracing twice to Colantha Johanna Lad and twice to King Segis Pontiac Hero, a careful blend of high producing lines.

FISHKILL MAY INKA COLANTHA—She obtains 50% of her blood from Hengerveld Homestead DeKol 4th, sire of a 1,056 pound cow. Also she traces three times to Dutchland Colantha Sir Inka. There is real production back of this animal.

FISHKILL INKA HENGERVELD—Her dam and sire are both by the famous Hengerveld/Homestead DeKol 4th. Three times she traces to Dutchland Colantha Sir Inka. Her dam has excellent records in every day dairy work, she being from a 24 lb. cow averaging 80 lbs. milk per day.

These highly bred heifers are offered subject to prior sale at.....

\$300.00
Each

The Plains of Abraham

(Continued from Page 12)

timber was heavy and dark, swamps were undrained, rivers and lakes were shadowed by dense vegetation, and in the humid, sweating mould of these places, the malevolent pestilence was born and rose in clouds that sometimes obscured the face of the moon. During these weeks a cordon of decayed stumps and logs smouldered night and day about the Bulain cabin, screening it in pungent smoke, and outside this small haven, work on the farm was continued at a price of physical martyrdom, except under a burning sun, when the insects sought refuge from the glare and heat.

But this summer Jeems's body as well as his mind had found something new with which to grapple, and instead of remaining in the shelter of smoking logs, he greased himself like an Indian and worked shoulder to shoulder with his father and uncle. The trader's leathery skin was toughened by years of exposure until it was immune to the discomfort of mosquito venom, and Jeems struggled to keep in his company and succeeded in doing it, though on close and sultry days or when a storm was brewing, his father advised him to leave the fields. Hepsibah exulted in this fortitude of his young companion, and when the trying weeks were over and late August brought relief, he had put Jeems through a course of training which he swore would make it easy for him to defeat Paul Tache when they came together again, and had taught him the tricks of small-arm loading and firing until at thirty paces his pupil could send a pistol ball into a four-inch target three times out of five. Jeems's pride in this weapon was almost as great as that which he took in his bow, in the use of which his expertness in sending an arrow to its mark never failed to draw expressions of amazement and approbation from his uncle.

Plans Available for Bull Pen

SEVERAL states are emphasizing the need for substantial bull pens to cut down the losses of life which are continually taking place from failure to properly restrain the herd sire. The New Jersey College of Agriculture at New Brunswick has a special set of plans which will be distributed free to New Jersey residents.

"America's Horse Power" is now available to breeders and friends of the Percheron who are interested in a new book about the drafter. It is published by the Percheron Society of America, and as long as the supply holds out will be given free of charge to all who write for a copy.

If you want one send your request to Ellis McFarland, Secretary, Percheron Society of America, Union Stock Yards, Chicago, Ill. Secretary McFarland believes that the reading matter and illustrations will prove interesting and unusual.

CATTLE

QUALITY HEREFORDS

Bulls, Heifers and Cows—one or a carload.
William J. Lillis, Owner Schenectady, N. Y.

HEREFORDS for Sale

4 loads weaned calves; 3 loads short yearlings; 2 loads long yearlings; 4 loads heifer calves; 3 loads springers. Well bred, medium flesh, the good kind. Can sort, other cattle. 2 loads young work horses. Write or wire.

The Service Bureau

A Department Devoted to the Interests, Welfare and Protection of A. A. Readers

Swindling the Dead

THOSE whose chief interest is to earn a living without working, have found two methods of extracting money from relatives of persons who have recently died.

One form of swindling the widow, which is followed by publishers of biographical encyclopedias, is to watch the obituary notices, and send a form letter to the widow, indicating that her husband had been corresponding with them, concerning the printing of his biography. Later the representative of the concern calls, and asks for a picture of her husband. The widow is told that a cut of the photograph would improve the appearance of the sketch, but that she will have to pay to have the cut made. If she is finally

pardoned it will be a temptation for others to do the same thing. If you can do anything to help us we shall be very grateful."

There is altogether too much chicken stealing going on in this section and we believe that vigorous action is necessary to stop it. Unfortunately there seems to be a feeling in the minds of many judges that chicken stealing is of little importance. Perhaps this feeling dates back to the time when they may have helped secure chickens for a chicken roast from the neighbor's hen roost. However, when organized gangs go through the country stealing chickens because it appears to be a safe method of making a living without working, we believe it is time not only to give a full prison sentence, but to see that the sentence is served.

Reward!

AMERICAN Agriculturist offers a One Hundred Dollar (\$100.00) reward for evidence which leads to the arrest, conviction, and sentence of any person or persons who defraud an American Agriculturist subscriber who has a Service Bureau Sign posted at the time such fraud is committed.

induced to do this, she signs what she supposes to be an order for the cut. She later finds to her sorrow that she has signed a contract calling for the payment of a considerable sum of money.

Another concern publishing Bibles follows a plan of sending the Bibles to persons just deceased, together with a letter which reads as follows:

"Enclosed please find Bible which you ordered a short time ago. We are sorry this has been delayed, and trust it will prove satisfactory. Kindly send us check or money order for \$1.98 by return mail."

Relatives of the dead person naturally assuming it has been ordered, are rather likely to send the check as requested.

Correspondence Course Denied Use of Mails

THE Bertillon National Detective Agency, of Rochester, New York, operated by F. D. O'Sullivan, has been denied the use of the United States mails, in an order issued April 20, by the Post Master General. This is another correspondence course in picking up stray criminals, and the action of the post office indicates that they feel that the claims of the promoter were misleading.

Should Serve Full Sentence

A SUBSCRIBER writes us concerning a recent item on the Service Bureau page about two Orange County men who were sentenced to Sing Sing for stealing chickens. Our subscriber says: "A move is now under way to have these men or rather Judson, as he is the one who has money to employ counsel, pardoned by the Governor. Our society, the Montgomery Chicken Thief Detecting Society, is very anxious to see these men serve their terms as they are not only a menace in themselves and if they are

Are You On a "Sucker List"

ONE stock in trade of those attempting to promote a get-rich-quick scheme is a "sucker list." If you get through the mails all kinds of glowing literature, telling of great profits in oil, mines, new inventions, etc., you may be assured you are on such a list. Possibly you answered an easy puzzle scheme, and your name has been sold to various concerns as a good prospect.

The cost of selling stock in fraudulent schemes is usually rather high. In one case, investigation by the Better Business Bureau, the company spent nearly \$30.00 per person in order to sell this stock by mail. This cost did not include the cost of labor

Promptness Appreciated

RECEIVED your draft of \$42.86 April 24 which helped me out very much while I was laid up after the accident, that I was in March 14th.

I think it is the best insurance protection any man can carry.

I want to thank you for your prompt service and also for the check I received.

Cordially yours,

Signed **Edward A. Rapke,**
Rome, N. Y.
R. F. D. 1.

for mailing. Each person on their list received the following literature:

- 13 one-page letters
- 20 two-page letters
- 6 three-page letters
- 2 four-page letters
- 52 faked newspaper clippings
- 39 pieces of glowing literature
- 34 return post cards
- 72 subscription blanks

You Get Only What You Pay For

What can you tell us of the Goodyear Company of Kansas City. We recently received a letter inclosing a credit check for \$5.00, and a statement that if we returned the check together with \$5.95 in cash, we would receive a raincoat worth \$10.95.

FIRST let us state that the Goodyear Company mentioned has no connection with the Goodyear Tire Company. This company periodically floods the country with such letters. On several occasions we have stated our opinion of credit checks in general. We have yet to learn of a case where we considered the credit check of any value. In this case you may be sure that the raincoat received would be worth \$5.95 or less.

Betty's Scrapbook is exactly the right size for the Little Recipes for Little Cooks.

7 Crusaders for Farm Prosperity

And now, increased manufacturing facilities enable the world's greatest milling company to bring to the east, a line of feeds that will set a new standard of excellence in feeding results.

Gold Medal Feeds—made to the highest possible quality standards—from formulas that proved their value through actual farm tests—and carrying a guarantee with every sack that you must be satisfied or you get your money back—will give you your money's worth and more, in production and in the health of your farm animals.

The same ideals of quality, the same careful manufacturing pro-

cesses that have made Gold Medal "Kitchen-Tested" Flour the most favored brand among American housewives—have enabled Gold Medal "Farm-Tested" Feeds to deliver the biggest dollar's worth of feeding value, wherever they are used.

Ask your dealer for Gold Medal Feeds—or write us for the name of your nearest dealer. Let the famous line of Gold Medal "Farm-Tested" Feeds show you what your cows, hogs and chickens can really do for you.

Gold Medal Feeds are rich in vitamins, high in digestibility, reasonable in price, and guaranteed to satisfy you.

It's "Kitchen-tested" to assure best results, always.

With Gov. Roosevelt on the Barge Canal *Tonnage Transported Has Increased Four Times in Ten Years*

EVER since Governor Roosevelt was elected, he has felt that he wanted to see with his own eyes all of the great institutions and enterprises which the State is operating, including especially the Barge Canal and the State institutions where the insane and other dependents are cared for. So the Governor planned for some time to make a trip through the Barge Canal, stopping frequently to visit the State institutions.

Henry Morgenthau Jr.

It has been my dream for several years to go through the canal, so I was delighted with the opportunity to make this interesting trip with the Governor's party on July 7th. We went aboard the boat "Inspector" to sail 339 miles through the Erie Canal to Tonawanda where the canal meets the Niagara River. In the party were the Governor and Mrs. Roosevelt; their son, Elliott; Frederick Stuart Greene, Superintendent of Public Works, and Mrs. Greene; Thomas F. Farrell, in charge of the canals of the State; and Guernsey Cross, secretary to the Governor.

I must confess that previous to this trip I was under the impression that the Barge Canal was a "white elephant", toward the support of which all of us taxpayers were forced to contribute. Imagine my surprise then to see the great activity on the canal where I saw boat after boat heavily laden constantly passing us. I realized that I had been judging the canal under past rather than present conditions.

The barge canal has had its ups and downs. What a great day it was in New York State his-

By HENRY MORGENTHAU, JR.

tory when the completion of "Governor Clinton's Big Ditch" was celebrated on a fall day over one hundred years ago, in 1825. Governor Clinton, attended by many distinguished men, made the journey from Buffalo to Albany and thence to New York City in decorated canal boats. Cannon were placed along the entire route at intervals of five miles, and on the day celebrating the completion of the canal these cannon flashed the news from Buffalo to New York in ninety minutes.

Kegs of water were carried from Lake Erie to the Atlantic Ocean on Governor Clinton's boat, and the Governor completed the celebration by emptying the contents of one of the kegs into the salt water, thus commemorating, he declared, "the navigable communication accomplished between our mediterranean seas and the Atlantic Ocean."

Men thought their transportation problems were largely settled, and the State and the nation went on a wild spree of building canals

everywhere. The old, dry canal beds in almost every section of New York are mute testimony to the exaggerated hopes of mankind, for the railroads soon came and to a very great extent superseded the canals and put them out of business.

However, the Erie Canal has lived through the years, but, unfortunately, for a considerable portion of the time, it has not been a paying proposition. In 1920, the people of the State voted a bond issue of \$100,000,000 to enlarge and modernize the canal, and a thorough job was done. The system makes over 75 per cent of its length out of existing water courses. It was not completed until 1918, and consists of four branches: First, the Erie, crossing the State from Lake Erie to the Hudson River. And, by the way, until you have seen New York State from the canal, you have not seen one of the most beautiful, interesting and important parts of our great State.

Then there is the Champlain, extending northward to Lake Champlain and affording an entrance to the St. Lawrence by means of a Canadian canal. The Oswego Canal branches from the Erie near Syracuse and links the main line with Lake Ontario. The fourth section is the Cayuga-Seneca, leading from the Erie and connecting the two lakes for which it is named.

The following figures will give you some idea as to the amount of tonnage carried on the Barge Canal system during 1928:

	Net Tons
Cayuga-Seneca	46,552
Champlain	415,717
Erie	2,535,684
Oswego	92,045
Total	3,089,998

Going back ten years, the Erie division of the canal carried only 667,374 tons as against 2,535,684 in 1928. This will show how the use of the canal has increased by leaps and bounds, (Continued on Page 14)

—Courtesy N. Y. S. Department of Public Works
When a boat comes to a "hill" in the barge canal, it is taken into a lock, great water tight doors are closed behind it and water is pumped into the lock. When the proper level is reached the doors ahead of the boat are opened and the boat proceeds.

FLY-TOX

The Scientific Insecticide Developed at Mellon Institute of Industrial Research by Rex Research Fellowship...

MOSQUITOES... Flies, fleas, roaches, bed-bugs... all kinds of insect pests... are quickly and easily killed with fragrant FLY-TOX spray. Factory tests in the FLY-TOX "Chamber of Death" prove it.

Has a purifying perfume-like fragrance.

A vast army of insects is bred in FLY-TOX laboratories to be released in the FLY-TOX "Chamber of Death" to test and certify the quick and positive killing qualities of FLY-TOX before it is sold to you. Every bottle guaranteed and backed by this test.

FLY-TOX is a clean, clear liquid sold in bottles with the blue label. FLY-TOX may be freely sprayed everywhere as it is harmless to people and will not stain.

Another Rex Product

STOCKAID ANIMAL SPRAY

Repels and kills flies, mosquitoes, fleas and lice... won't irritate the skin... keeps hair nice and glossy... will not clog sprayer. Protect livestock against insect torment... use STOCKAID, the scientific animal spray.

The PAGE HAND POWER MILKER

Lowest Price MILKER Ever Offered

It's Portable—Wheel It Anywhere and Start Milking

No Installation Expense—No Pipes—No Pulsator

Our surprisingly low factory price on this 2-cow Hand Power Milker makes it the lowest priced milker per milking unit ever offered. And for only \$12.50 extra a third cow attachment can be added enabling you to milk 3 cows at once. Thousands in use. Easy to operate.

\$5 DOWN AFTER FREE TRIAL

No other milker on the market can compare with the PAGE for low price—ease of operation and milking efficiency. We let you prove it before you pay. We will put this PAGE Hand Power Milker in your barn on FREE TRIAL. See the time and work it saves; see how soothing its action on the cows and how sanitary and easy to clean. Then if satisfied, pay only \$5 down, balance in easy monthly payments.

10 MONTHS TO PAY 10 YEARS' GUARANTEE

This Page Milker is portable—no pipe lines to install—no pulsator—no tanks—no expensive special pails; just wheel it in and start milking. Milks right into your own shipping can.

Liberal Exchange Privilege

Should you later wish a PAGE 2 or 4 cow gas engine or electric Milker you can trade in your PAGE Hand Power Milker on very liberal terms.

Write For Free Book

Get the facts about the lowest priced milker which pays for itself in short time. Don't delay—this liberal No Money Down offer only good until we have an agent in your locality. User Agents Wanted.

With the A.A. Crop Grower

A Vermonter Visits Maryland

WE say the world is not a very big place, after all, when we meet some stranger who knows someone else who once went 'fishing in our old home town.

By H. L. BAILEY,

or better or more wonderful just beyond where we go.

Harold L. Bailey

Eastern Shore counties of Virginia and Maryland, the southern part of that great peninsula, between Chesapeake Bay and the Atlantic Ocean, which common usage makes Del-Mar-Va from the three states to which it belongs.

Even were Vermont ironed out, as has been said, to make it the size of Illinois, and incidentally as flat as this southern country, the differences would still be vast. There would be all the variation between an essentially dairying country with spacious farm buildings, constructed to brave the northern winters, and a cash crop country where potatoes, white and sweet, strawberries and other fruits, grown in a balmy climate, apparently require but the minimum in housing facilities. There would be the distinct differences in soil, in forest cover and, not least, in thought and manner of the people.

Del-Mar-Va Potato Crop Light

The writer's business on the Eastern Shores was to represent Vermont Certified seed potato interests at the potato tours arranged jointly by the County Agents of Accomac County, Va., and Worcester County, Md., the section about seventy-five miles long and seven miles wide from which some 23,000 carloads of Irish cobbles go to fill up the mid-summer white potato market in the North. The potato industry was naturally the prime interest of the occasion, but there were other features of the country which could not fail to impress a northerner on his first trip there. Treating first of the spud, the nub of the matter from the market standpoint was this: a heavily reduced acreage and a short crop, averaging according to estimates of many growers not over 45 barrels to the acre. On the whole they figured a crop reduction from last year of 35 to 40% which means a considerable drop from normal. The latter part of the growing season was exceedingly hot and many fields when digging commenced around the 20th of June were going down with early blight. It would appear that the Eastern Shores crop would be well cleaned out so as to leave plenty of room for the late crops of the North as they come along in regular order.

As compared to the two other great eastern potato regions, Long Island and Aroostook County, Maine, the individual acreages seemed smaller in the Eastern Shores area, though it is said that they are more extensive near Cape Charles in Northampton County on the extreme tip of the peninsula. Things always are just a little bigger

Maryland produces certified seed potatoes itself—principally in Worcester County, much to the writer's surprise—instead of in the western mountain areas where conditions would nearly approximate those of the more northern states. But they are grown as a late crop. They are planted in August and harvested as immature tubers, presumably around Thanksgiving time; and they are only good for one season. That is, it seems to be generally agreed that a late crop like this, grown from northern seed, will make satisfactory seed for next year's regular planting, but potatoes from that crop will not serve. Just why in one season they should become so thoroughly infected with disease puzzles the plant doctors, but the fact is there. Thus the commercial growers are dependent upon the extreme northern states for new seed at least every other year, except for the very small amount which is produced in the mountain country. That's why we were there with the boys from Maine, Northern New York and the Provinces, looking for the chance to deliver the goods.

Land as Flat as a Pancake

The railroad runs straight and on the dead level down the middle of the peninsula and the land that stretches away on either side is as flat as the flattest pancake ever flapped. There are miles, altogether of sweet potatoes, looking, as we slipped along on the train, like strawberry sets. Later on they will look like morning glory plants spread out on wide flat hills. And there were wheat fields, many more of them than we had supposed were raised in that section. It was being harvested and occasionally in Worcester County there were farms which looked as though they belonged in the Middle West with their grain, and barns with over-shot roofs. They were near Snow Hill. Why the name, I do not know. There certainly was no snow there and no hill that could be recognized as such by a Green Mountaineer.

Neither there nor anywhere on the trip. But the landscape had a compensating feature in the great and fine stands of loblolly pine. They looked like plantations, and we received differing replies to inquiries as to whether or not they were. At any rate they were perfectly even in growth, the trunks running up almost entirely straight to a height of seventy five feet and no limbs for more than two thirds of their growth. They make barrels from them, among other things, and barrels are an important commodity on the Eastern Shores. Potatoes, white and sweet, are shipped in them and the trainloads which are going out each day through the season stand for many thousands of board feet. And they serve another purpose. They provide "resources" in local parlance, for the maintenance of humus in the soil. The "shatters"—Southern variant for our pine needles and cones—are carefully raked up and worked into the ground.

The question needs must come to the mind of the northern visitor as to what part this section of Virginia, east of the Bay, took in the Civil war. There are fine old southern homes here, and, occasionally dotted over the landscape, are little one-story whitewashed houses

(Continued on Page 6)

These Dairymen Have Improved Their Herds

Some Results Obtained Through Dairy Improvement Associations

MOST of the dairy counties of the East have one or more Dairy Improvement Associations. These organizations, often called cow testing associations, are made up of from twenty to thirty herd owners. They organize and hire a tester who spends one day with the herd each month, weighing the milk, testing it for butterfat, weighing the feed eaten by each cow and entering all the figures in a record book which becomes the property of the herd owner. We have felt for a long time that membership in a Dairy Improvement Association is one of the quickest ways to increase the production and profits of a herd. We know that actual experience is more convincing than opinions so we asked several friends to tell us just what results they have secured.

THE EDITORS.

Learned More About His Business

By G. S. COWLES
Ashville, N. Y.

MY first experience in dairy work was making butter in a creamery and paying the farmers for their milk by the Babcock test. This was in 1895 and '96—about the first years that milk was paid for according to the butterfat test in this section. The dairy cows were mostly of a mixed native breed of cattle, many of them milking shorthorns with sprinklings of Jersey blood and a few Jersey herds. Production was from three to five thousand pounds per cow and milk worth about seventy-five cents per hundred pounds, making a herd which averaged \$30 per cow a very good one. I tested many of the farmers' cows to help them find their low pro-

ducers. This was before the days of the cow testing associations.

When I owned a herd of my own I realized the amount of work it was for a farmer to keep any kind of a record on individual cows to know what they were producing and what was their cost of keep. So when the first dairy improvement association was organized within reach I joined. I think the tester traveled over nearly one-half of Chautauqua county to get herds enough for an association. I had in mind two things then; one to prove which was my most profitable producers to raise calves from, and to improve my herd which consisted of a few registered Holsteins and the balance grades.

The other idea was that I might improve my own methods as a dairyman by knowing more about my business. As I look back over the years of work I think the latter idea was worth the most. While some cows cannot be made profitable under good care, often it is the fault of the owner. The record of a cow's production is a month to month check-up on a dairyman's work and when you find a cow falling off in production, look for the reason and the increase in the production of the herd by the attention to the little things will pay the tester many times over. I was fortunate to have some very good producing cows at the beginning of my work of herd testing, having records of eight and ten thousand pounds of milk and three hundred and fifty pounds of fat, but the average of the herd was below, there being some cows with five or six thousand pound records.

We have increased the average of our herd from seven or eight thousand pounds and 250

pounds of fat to eleven thousand pounds of milk and 400 pounds fat and this with nearly half the herd first calf two year old heifers. We find nearly every buyer of a bull calf very much interested in the production of its dam. We think the records made in the C. T. A. work under good farm management of great value to dairymen who are buyers of dairy bulls to improve the production of their herds, as these records are made under the same conditions as the farmer keeps his cows and is equal to a much larger record made under such conditions as some of the high records are made.

We have sold at least three cows with good farm records of about four or five hundred pounds of fat, which have gone over the 1,000 pound of butter production under the management of expert herdsmen, which shows that the cow producing four or five hundred pounds of fat under ordinary farm management to be a very high class producing cow.

* * *

The Quickest Way to Increase Production

By FRED DUBOIS
New Paltz, N. Y.

IHAVE belonged to the Dairy Improvement Association for seven years. The quickest way to improve a herd is to get records of the cows both for milk production and butterfat. Two cows may give the same amount of milk but one may test twice as much in butterfat as the other. The only way to find this out is to keep records of each cow both for milk production and butterfat. Then you can

(Continued on Page 16)

When the Grain Binder Fails to Bind

How to Adjust the Knotter So It Will Work Properly

WE can imagine fewer conditions more exasperating than to have grain dead ripe, to have the weatherman predict showers and at the same time have the knotter on the binder go wrong and fail to do the work expected of it. At such a time there is always a tendency to tighten up one adjustment screw a little and loosen another, with the hope that it will bring about the desired result, until finally it becomes almost impossible to tell just what is wrong.

To the man who understands his machine much can be told from the condition of the twine. On this page is an illustration which tells the whole story. When the twine is found on the bills of the knotter looking as it does in figure 1, it is a sign that the twine tension is too tight and that the disc tension, which holds the end of the twine, is too loose. Consequently, as the needle goes around the bundle, it pulls the twine out of the disc instead of pulling it out of the twine can. Consequently, the knotter bills catch only one end of the twine and fail to tie a knot. The remedy, of course, is to loosen the twine tension just a little and if this does not work, to tighten the disc spring slightly.

Figure 2 in the illustration shows the twine in the same condition except that it is found with the bundle instead of hanging on the knotter bills. In this case the twine tension is usually about right but the disc tension is too loose. As the bills rotate to tie a knot, they naturally pull the twine tighter around

the bundle and at this point the twine pulls out of the disc and consequently the knot is tied in only one end. However, the twine is cut and thrown out with the bundle. The remedy is to tighten the disc tension. In an old binder, where tightening the disc tension does not seem to help, it may be the disc has been badly worn, in which case a new one should be put on or it may be that the knotter is worn so that new bills are needed.

A third possible trouble is that the disc may be out of time. When the twine disc comes to rest, the notches in the disc should be close enough to the tongue so that a lead pencil will just slip into the notch. In this way both ends of the twine will always be placed squarely in the notch.

In figure 3 the appearance of the twine (which

is found on the bills) is similar to that in figure 1, except that one end of the twine looks as though it had been crushed or broken. This trouble comes from too tight a disc tension and too tight a twine tension. The disc crushes the twine and as the twine is tightened before the knot is tied, it breaks off at the disc. The remedy, of course, is to loosen the disc spring tension and the twine tension.

In figure 4 the twine looks the same as in figure 3 except that it is found with the bundle instead of on the bills. In this case the twine tension is perfect but the disc spring is too tight as it was in the condition found in figure 3. As the knot is being tied, the twine breaks at the disc instead of pulling out and the twine is kicked out with the bundle.

In figure 5 the twine is found with the bundle, both knots are crushed and there is no knot in either end. In this condition both ends of the twine are so bruised by the disc that as soon as the bills begin to revolve to tie the knot, both ends of the twine break off at the disc before a knot can be tied. To correct, loosen the disc tension.

When the twine is found as illustrated in figure 6, it usually indicates that the spring holding the knotter bills together is too loose. Consequently, the twine is pulled out of the bills before the knot can be tied. The remedy is of course to tighten the knotter bill spring. Another possible cause is serious wear of the cam roller which opens the

(Continued on Page 16)

This illustration, which is reproduced from circular 309 of the Illinois State College of Agriculture, shows the appearance of a number of knots where the knotter fails to function. The story on this page tells what adjustments to make to correct the troubles.

Time for Action at Muscle Shoals

ONE of the great, unsettled problems of the country of immense importance to farmers is, what shall be done with the great power and fertilizer plant owned by the government at Muscle Shoals, Alabama.

For many years, ever since the war, in fact, Congress has been debating the question of what to do with Muscle Shoals, but nothing is done. Why? Is it because the power interests are so strong that it is impossible to get Congress to take definite action? Because of this delay, federal properties costing more than \$20,000,000 to build stand in idleness, and what little power is sold goes to a power company at a nominal cost.

Our readers will remember that Wilson Dam at Muscle Shoals, one of the greatest dams in the world, was built on the Tennessee by the government in 1918, and great nitrate plants were erected for the fundamental purpose of providing explosives for ammunition to use during the war. In times of peace, nitrate plants are equally as important for the production of fertilizers.

But because of the vacillating and the seemingly cowardly policy of Congress, no fertilizer has been manufactured at Muscle Shoals, although the government has had splendid offers to rent the plant for fertilizer manufacturing purposes. Henry Ford made a good offer in the first place, but grew disgusted with the way the government handled his offer and withdrew.

Since that time, the American Cyanamid Company has repeatedly offered to take over the properties at Muscle Shoals on a long time lease for the manufacture of fertilizer. This company promised to bring the plant up-to-date with its own money, pay back the money invested in the dam and fertilizer plant, and sell its product at a restricted profit in competition with all others. What more did the government want?

The argument has been advanced time and again that the nitrate manufacturing plant at Muscle Shoals is obsolete and out-of-date. Whether it is or not, what business was it of anyone's, providing the American Cyanamid Company was willing to lease the plant and put up its own money to manufacture fertilizer therein?

Some things that have come to light recently show that the most powerful combination of capital in America today is the power trust. We can

testify from our own experience from the amount of propaganda that comes to our own desk that the power companies of America have left no stone unturned to influence and mislead public opinion about the true facts at Muscle Shoals.

We have hesitated to think or to say that Congress was influenced to prevent right action in the disposal of Muscle Shoals. But certainly the lack of action under the circumstances is coming pretty close to a national disgrace.

Dairy Companies Are Merging

ON July 12, the Borden Company announced that it had taken over fifty-two more milk plants in thirteen states and three foreign countries. These were plants for the distribution not only of milk, butter, cheese and ice cream but also of eggs and poultry, including one egg breaking plant in China. A short time ago the Kraft Cheese Company bought the Southern Dairies, Inc., a very large manufacturer of dairy and ice cream products with plants scattered throughout the East and Southeast.

Not a week goes by that we do not read of some merger in the milk distributing and manufacturing business, and in fact in almost every other kind of business. What is going to be the effect on farmers?

Dr. C. W. Larson, former head of the Dairy Bureau of the United States Department of Agriculture, believes that the dairy mergers will have many favorable results, both for producers and consumers. He points out that the larger operations will make it possible to bring about savings in manufacturing and distributing costs, but of course the natural conclusion is that the stockholders will get these savings, and not the farmers or the consumers.

Something for our eastern dairymen to think about is the fact that both of our largest distributors of dairy products, the Borden Company and Sheffield Farms, are now members of nationwide organizations, with plants all over the country. It is difficult to see, therefore, how they can have very much fundamental interest in maintaining the New York milk shed. In other words, it is mostly up to our own producers, without much hope of outside help from anyone, if we are to keep out milk from other sections.

As we have before pointed out, we must emphasize again the fact that these mergers are making it more and more difficult for farmers to do business as individuals. What chance has a farmer with a capitalization of ten thousand dollars against organized millions?

A Successful Life

WHEN I come to the End of the Road, I hope that I shall have made a small fraction of the real achievements in my life that were attained by a woman in my old home town who has just died.

If anyone was ever successful in the real meaning of the word, Mrs. Lena Joslin was, and her good works of a long lifetime were all accomplished in a little country community. That is something for young people to think of who believe that success is only to be attained in the city or in some other, far distant place.

What an inspiration such a life is to those whose environment is restricted to what seems to be the commonplace and to the irritating and irksome duties of everyday life. It is fairly easy for most of us to measure up in great emergencies. The real heroes are the everyday ones.

Space will not permit the enumeration of all the good works accomplished by this one life. Nor is it necessary. Work well done speaks for itself. Several poor boys and girls owe their education to financial help secured for them by Mrs. Joslin and her husband, and scores more are indebted to her leadership and teaching for their appreciation and knowledge of music. The lecture course, the school, the church, in short, every-

thing for the comfort and happiness of her neighbors had Mrs. Joslin's active help.

Fifty years are a long time in one lifetime, but for more than fifty years this lady played the organ in the village church. As I listened to that funeral service and the organ, now played by other hands, I thought of all the folk who had sat in that church and heard that organ during the past half century. What history of human effort, joys and sorrows their lives could tell. What hopes and dreams to high endeavor had that music inspired the youthful listeners. What reveries and memories of friends long since gone had passed through the minds of the older ones. Think of the happiness immeasurable in the hearts of the many young brides who had come gaily down the aisle of the church in that fifty years to the strains of the Wedding March, and also of the tears of all those who had listened to the old organ play for the last time for a loved one whose ears would hear no more.

But at last the fingers of the player herself faltered and grew still, and hundreds who had walked and worked with her along the Road now crowded the church to listen to the requiem played on her loved instrument, and to wish her God speed as her glad Spirit goes marching on.—E.R.E.

Cyrus T. Fox

PENNSYLVANIA lost a fine citizen in the recent death of our old friend, Cyrus T. Fox, at Reading, Pennsylvania, at the age of eighty-two. Mr. Fox was at one time State Pomologist. He was a college trustee, prominent in agricultural fair work, and an authority and lecturer on agricultural and horticultural matters.

Oliver D. Schock, one of our Pennsylvania correspondents, writes:

"Mr. Fox was a lifelong friend. His entire lifetime was very largely devoted to an exemplification of the old adage, 'Pro bono publico' (For the public good)."

Our readers will remember a story in this publication a short time ago written by Mr. Fox in which he described an interview with Abraham Lincoln.

Welcome, Visitor

THE other day we left our automobile for a few minutes on one of the streets of Cobleskill, while we got something to eat. When we came back, there was a ticket tied to the door. We thought for a moment that it was an invitation to visit the police court or the judge for some violation of the traffic law, so imagine our pleasant surprise when we found that the little card was a welcome to Cobleskill. It stated that we were entitled to park our car as long as we pleased, and invited us to come again.

The other side of the card said that Cobleskill had a population of approximately 3,000, being the largest village in Schoharie County, and the first in manufacturing, with excellent climate, churches, schools and hotels. It also emphasized the fact that it is a leading agricultural community.

We take pleasure in giving these facts wider circulation because this community goes out of its way to welcome strangers and make them feel at home as long as they behave themselves.

Eastman's Chestnut

THE poor old Scotch have to take it again: Maggie's sweetheart, a proverbial tight-fisted Scot, had taken her out for the afternoon, and that was about all. They rode some distance on the trolley, turned around, and rode home again. Never was mention made of food or entertainment.

Back within her own gateway, Maggie, who had keenly felt the neglect, sarcastically proffered Sandy a dime.

"For the car fare you spent on me," she said meaningly.

"Hoots, toots woman," returned Sandy, pocketing the coin, "there was nae hurry. Saturday wad hae been time enough."

Federal Farm Board Has First Session

Will Meet Daily in Effort to Solve Marketing Problems

ALTHOUGH one member of the new Federal Farm Board is yet to be appointed, the first meeting of the Board was held in Washington on Monday, July 15th. The members of the Board met at ten o'clock in the Cabinet Room of the White House, where they were met by President Hoover, who in a brief talk outlined their duties and responsibilities as follows:

"I have no extended statement to make to the Federal Farm Board as to its duties. The wide authority and splendid resources placed at your disposal are well known.

"I am deeply impressed with the responsibilities which lie before you. Your fundamental purpose must be to determine the fact and to find solution to a multitude of agricultural problems, among them to more nearly adjust production to need; to create permanent business institutions for marketing which, owned and controlled by the farmers, shall be so wisely devised and soundly founded and well managed that they, by effecting economies and giving such stability, will grow in strength over the years to come. Through these efforts we may establish to the farmer an equal opportunity in our economic system with other industry.

Time Required for Results

"I know there is not a thinking farmer who does not realize that all this cannot be accomplished by a magic wand or an overnight action. Real institutions are not built that way. If we are to succeed it will be by strengthening the foundations and the initiative which we already have in farm organizations and building steadily upon them with the constant thought that we are building, not for the present day, but for next year and the next decade.

"In selecting this board I have sought for suggestions from the many scores of farmers' co-operatives and other organizations, and yours were the names most universally commended; you are thus in a sense the representatives of organized agriculture itself. I congratulate each of you upon the distinction of his colleagues, and by your appointment I invest you with responsibility, authority and resources such as have never before been conferred by our government in assistance to any industry."

Christensen Appointed Secretary

Later the Board took up temporary quarters at the Mayflower Hotel. One of the first acts of organization was to appoint Mr. Chris Christensen as Secretary of the Board. For three years Mr. Christensen was head of the Cooperative Marketing Division of the U. S. Bureau of Agricultural Economics.

Wheat is the Big Problem

It has been expected, in view of the plight of the wheat farmer, that the Board would first take up the problem of improving wheat marketing conditions. It is interesting, whatever the cause, to note that wheat prices went up at Chicago the day the Board met. July wheat made a new high for the season, closing at \$1.57½, which was 8½¢ above Saturday's closing price, and 43½¢ above the May 31st price

of 96¼¢. September wheat sold for \$1.42½¢ and December wheat at \$1.48½¢.

Rumors Indicate Increased Production

The New York Packer, in commenting on the Federal Farm Board, states that rumors from the west indicate that wheat growers intend to put in every available acre next year, reasoning that the Government will make every effort to back up the work of the Farm Board for the first year, at least. The argument is heard that since the bill has the backing and support of the Government, the plan will be made a success, at least for the first year, and that consequently it will be profitable to plant every available acre to wheat next year.

Editorial comment in general is sympathetic towards the efforts of the Farm Board. It is generally admitted that the President is absolutely honest in his efforts to improve marketing conditions and he bears the reputation for making a success of any venture that he undertakes.

Although the majority of Eastern farmers appear to be rather unenthusiastic about the whole plan, it is likely that they will reserve judgment and give the new law and the Federal Farm Board every opportunity to make good.

The Board will have the administration of a half billion dollars, \$150,000 of which has already been made available by Congress. Immediate plans are for daily sessions of the Federal Farm Board. It is generally agreed that the task facing them will require their best efforts.

The Board at present consists of the following members:

Alexander H. Legge, who gave up his position as vice-president of the International Harvester Co. to serve as Chairman of the Board,

Arthur M. Hyde, U. S. Secretary of Agriculture, who is a member ex officio,

James D. Stone, of Lexington, Ky., who is Vice-Chairman, and the President of the Burley Tobacco Growers,

William Schilling, of Minnesota, President of the Twin Cities Milk Producers' Association,

Charles Teague, President of the Farmers' Legislative Committee of California,

C. B. Denman, President of the National Livestock Producers' Association.

Carl Williams, of Oklahoma, Editor

of the Oklahoma Farmers Stockman, Charles S. Wilson, of Hall, N. Y.

Board Bars Loans at This Time

A statement issued by the Board on July 17, said:

"Today's discussion of the Federal Farm Board have largely revolved around the loan provisions of the Agricultural Marketing act. This act provides that money be loaned to farmers' cooperative associations by the board, under certain limitations, for purchase or erection of physical facilities, and that loans may also be made for the financing of commodities in the ordinary processes of marketing. Policies of the board with reference to physical facilities not yet been laid down.

"In the matter of loans for the marketing of commodities, however the board believes that Congress did not intend it to supplant the services now rendered to cooperative associations by private banking institutions and the Federal intermediate credit banks. It is logical to expect that cooperatives will exhaust the lines of credit which may

be obtained at reasonable rates from these other institutions before coming to the board for further assistance."

It was further announced that the Board is not in a position at present to give definite consideration to applications for loans. When it is ready to advance loans as provided by the act, the board will give public notice to that effect.

"The board wishes to announce, in connection with this matter of loans to cooperative marketing associations," said a statement issued today, "that it will deal only with officials of the co-operatives themselves and that no association need employ counsel or other special representatives in order to gain a full, complete and sympathetic hearing of its problems."

Board officials again repeated today that one of the aims of those who will administer the farm act would be to reduce the marketing cost of agricultural products as a means of increasing the farmer's returns without adding a corresponding increase to the consumer's expenses.

Federal Container Law Effective November First

Can you give us some information about the standard container law which we understand was passed by Congress last winter? When does this law go into effect, what will happen to containers that do not conform to the law and what are the sizes which are legal under this Act?

THE Standard Container Act which was passed last winter defines certain standards for hampers, round stave baskets and splint baskets for fruit, vegetables and other purposes. This act will go into effect on November 1, 1929, and growers who are now using baskets which will be illegal under this act should plan to dispose of them before that date. The act was not made effective when it was passed so that growers would have an opportunity to dispose of the containers without loss.

Under the new law standard hampers and round stave baskets for fruits and vegetables are to be of the following capacities:

One-eighth bushel
One-quarter bushel
One and one-quarter bushels
One and one-half bushel
Two bushels

A bushel is defined as having a capacity of 2158.42 cubic inches. Sizes of standard splint baskets for fruits and

vegetables are designated under the new law as:

Four quarts	Sixteen quarts
Eight quarts	Twenty-four quarts
Twelve quarts	Thirty-two quarts

A quart is defined as having a capacity of 67.2 cubic inches.

In addition to stating that containers other than those made legal by this Act shall not be used either in interstate commerce or intra-state commerce, the law also states that no manufacturer shall manufacture hampers, round stave baskets or splint baskets for fruits and vegetables unless the dimension specifications shall have been submitted to and approved by the Secretary of Agriculture.

It is also illegal to sell baskets which do not meet these specifications.

Another effect of the law, in the opinion of the Solicitor for the department, is to make inoperative all State laws fixing weights per bushel for fruits and vegetables, when they are sold in baskets meeting its requirements. This means that no State law which is in any way in conflict with the Federal Act, either in the matter of prescribed weights or dimension specifications, can be enforced as to fruits and vegetables sold in hampers and baskets which comply with the

Federal Act. The department regulations declare that a basket or hamper the gross dimensions of which are such as to give to the untrained eye the appearance of a greater or lesser capacity than that of a standard container, or which is not readily distinguishable from another standard container, is of deceptive appearance.

These are the main provisions of the law but growers who are interested in getting a more detailed account of them may secure copies of the regulations which define the capacity and appearance of containers and the variation in capacity allowable by law by writing to the Department of Agriculture, Washington, D. C.

The members of the newly created Federal Farm Board at their first meeting with President Hoover. Left to right, seated: James C. Stone of Kentucky; Secretary of Agriculture Arthur M. Hyde; President Hoover; Alexander Legge of Chicago, Ill., chairman of the newly created Federal Farm Board and C. C. Teague of Los Angeles, Calif. Back row: W. F. Schilling of Minnesota; Charles S. Wilson of New York; Carl Williams of Oklahoma and C. B. Denman of St. Louis, Mo.

A.A.'s Western New York Farm and Home Talk

Crops Are Looking Good

SHORT trips both
East and west of
Rochester during the past week gave
opportunity to look over growing crops
and farm con-
ditions. It appears
to me—and I have
heard other ob-
servers say the
same—that the
Western New York
crop and income
outlook is the best
in several years.
The season is by
no means finished
and much vital to
crop production
may happen dur-
ing the next two
months. Conditions are somewhat
spotted also, due principally to dry
weather. Yet on the whole crops—es-
pecially cash crops—are a good stand
and are growing well.

M. C. Burritt

Hay is a bumper crop, largely as a
result of the early wet season last year.
Everywhere one hears stories of heavy
yields and full barns of alfalfa and
clover. Haying is perhaps about half
done in mid-July—late, but not as late
as last year.

Wheat and Oats Look Poor

The grain outlook is not so good.
Wheat which came through the winter
so well and gave early promise of a fine
crop has steadily deteriorated all the
spring. Early it had too much water
and was injured by the wet. Of late it
has been too dry. The straw is short
and fields are spotted and weedy. Cut-
ting will begin the last of the week.
Prices are very low and unsatisfactory.
Spring grain has suffered severely both
from rust and from drought. It will be
very short and promises poor yields at
the present time. Rains, if they come
soon, may help.

Corn, beans, cabbage and potatoes
all look unusually well with few excep-
tions. Where these crops were planted
very late or where the ground was
plowed late and it was very dry when
the crop was planted the stands are
poor. We have had periods of thunder
showers during the last two or three
weeks and where these rains have hit,
growing conditions are better. Never
has early plowing, fitting and repeated
working counted more heavily through
conserved moisture toward good stands
of crops. Corn is late but growing well
in the hot weather. Beans, of which
the acreage is much larger than in
several years, look very well. It looks
as if Western New York is staging a
come-back in this crop. Cabbage has
been hurt somewhat by the dry weather
but stands are reasonably good if late.
The price outlook on these crops is
also fairly good.

Canning Crops Good

The prospect for canning crops is
also pretty good. Early peas did not
have enough moisture to fill well.
Where it has rained late peas should
do better. The stands of tomatoes are
good and well advanced. Beans and
corn are coming on well also. The in-
come from canning crops should be
better than usual.

Fruit prospects are only fair. The
cherry harvest is on and the crop,
though not large, is better than last
year and prices are good. It will bring
in some welcome income. The pear crop
is light, but prices should be good due
to smaller western crops. The peach
crop is fairly good but orchards have
been so reduced during the past few
years that this crop is not much of a
factor except in a few favored areas.

The fifth spray has been applied on
apples during the past week. The fruit
is growing rapidly now and shows up
well. The State Horticultural Society
Report just out shows the average con-
dition of the apple crop not much if

any better than last
year, except in the
case of Baldwins. Fall varieties, and
Greening and McIntosh prospects are
below last year. Baldwin is about 50
percent more than last year. Since the
latter variety comprises nearly half of
the total bearing trees the present out-
look in Western New York seems to
be for a total crop about 25 percent
larger than in 1928. The total U. S.
crop however, is apparently 10 to 25
percent below last year which should
mean rather better prices and income
to growers.

A Well-Earned Vacation

This week end we took our 15 year
old boy to scout camp on Seneca Lake.
Since school closed he has carried his
share of the farm work. He has set his
half of nearly 100,000 cabbage and
cauliflower plants from the machine,
picked strawberries, done a man's work
in haying and had all the care of 500
pullets, as well as the lawns. He has
therefore earned his recreation. But
scout camping is much more than a
good time for boys who are really in-
terested. Nature study, handicraft in-
struction, the cultivation of skills, the
social life and the all around physical
development and out-of-door life are
worth much more than the cost, for
their educational and development
values. So father willingly takes on the
extra duties at home though he misses
both the companionship and the inter-
ested helpfulness of the boy.

Establish Superphosphate Institute

IN recent years manufacturers of
nitrogenous fertilizer materials as
well as manufacturers of potash-
carrying material, have carried on
vigorous campaigns of education to
acquaint producers with the value of
their product. Now the principal pro-
ducers of superphosphate which is
produced in the United States to the
extent of over four million tons annu-
ally, are cooperating to establish a
superphosphate institute with head-
quarters in New York City.

The aim of the institute will doubt-
less be similar to those already formed
by other fertilizer interests, namely
to carry on educational work as to
the value of their product.

A Vermonter Visits Maryland

(Continued from Page 2)

with brick fireplace chimneys built
against one end, reminiscent of war-
time sketches. Sometimes the chim-
ney alone remains. Some of them
were original plantation houses; some
of the smaller were slave quarters. But
we are told there were no military op-
erations there. Set off from the main
part of the state, the Union forces oc-
cupied the region at the beginning of
the war and, looking through the
Emancipation Proclamation, we find
Accomac and Northampton counties
among the few in Virginia which were
exempted from its terms as not being
in a state of rebellion. Whatever the
feeling may have been among the in-
habitants then, it was made plain to
us Northerners now that the war was
long over and that Maryland and Vir-
ginia fried chicken and other eats were
not myths; and if we had a sneaking
idea that the pleasant Virginian who
said: "How do you-all like this coun-
try down here Cap'n? Tell us about
yours up there," was more interested
in hearing our Yankee twang than in
our views per se, the pleasure was
made mutual in listening to his south-
ern speech.

Little Recipes for Little Cooks

by *Betty*

Lesson Number Five

The first days of vacation suggest lots of things to do and one of the nicest ones of all is to fix a little lunch and take it to a shady spot to enjoy it. Learn to make the things in this lesson for they are dandy for picnics. If you make them real well Mother will let you make sandwiches for the family picnics, too. Be sure to read each word carefully and save this page for your scrapbook.

A playmate tries some of Betty's cooking.

If You Like
Picnic Lunches
Learn About
Making Them
In This Lesson

Dear Little Cooks:

Summer is picnic time and I thought you would like to have some recipes to use when you are helping mother to get ready for a picnic. I guess sometimes mothers have to hurry so, getting ready, that it isn't much of a picnic for them, so I was very glad when I learned to help.

My little sister Helen and I are always teasing mother to let us have a few sandwiches, some fruit, some milk, and cookies and when we have our little basket packed we go find a cool, shady spot outside somewhere and eat our lunch. Mother says it really saves her work, when the men are away or will be very late, to have us do this and things do taste lots better on a picnic.

Do you all like picnics?

BETTY.

Picnic Eggs

First, I see that there is plenty of boiling water in the kettle in which I am going to cook the eggs. Then I pick out clean, sound eggs which I am very sure are fresh.

The steam will be very hot as it comes from the boiling water and I do not wish to burn myself, so I use a long-handled spoon or a pair of kitchen tongs to hold the eggs as I put them in the boiling water.

I let them boil 15 or 20 minutes and then, with my long-handled spoon, I take the eggs out and drop them in cold water.

When they are cold, I take them out and shell them. As I have each egg shelled, I place it on a clean plate. When I have this done, I cut each egg in halves and take out the yolk, which I put into a small bowl.

Then I am ready to mash the yolks fine and smooth and season them. For this seasoning I get ready (for each egg) a few grains each of salt, pepper and mustard, $\frac{1}{2}$ teaspoon of vinegar, $\frac{1}{2}$ tablespoon of melted butter. Mix these together and add to the egg yolks.

For six eggs use:

- $\frac{1}{2}$ teaspoon salt.
- $\frac{1}{2}$ teaspoon mustard.
- Few grains pepper.
- $\frac{1}{2}$ teaspoons vinegar.
- $\frac{1}{2}$ tablespoons butter, melted.

These seasonings may be too strong or not strong enough to suit those who will eat them, so it is a good plan not to add too much until you have tasted and are sure more would improve the taste.

Now I am ready to stuff the whites. I take a little of the yolk mixture in a teaspoon and put it in the egg white as neatly as I can. Or some-

times I have my hands very, very clean (of course every little cook always washes her hands before she begins to cook), and I take up a little egg yolk mixture in my fingers and shape it into a ball and put it into the egg white.

Nice Ways to Serve Them

When they are to be eaten at home at the table I like to put nice, crisp lettuce leaves on the plate and then I place the stuffed eggs on neatly. For a picnic they seem to go better if I pack them closely in a low bowl lined with lettuce leaves and cover them carefully with waxed paper.

Nice Cold Drinks

Wouldn't you like to know how to make the lemonade for the picnic, or a nice cold drink to take out to Daddy when he is sure to be thirsty?

A Suggestion to Mothers of Little Cooks

This is the fifth of a series of cooking lessons for little girls, prepared by Mrs. R. C. Dahlberg, mother of "Betty." They are carefully graded to lead beginners from the most simple cooking operations to a working knowledge that will allow them to prepare an entire meal. Each recipe given, as well as many others, has been tried and successfully carried through by eight-year-old Betty. The month interval between lessons allows plenty of time for trying them out several times, if necessary, to produce good results.

Your personal help in helping your little girls (and little boys, too) in completing the tasks that these lessons give, will show wonderful results in the future in the help that they will be able to give you through this knowledge of cooking. It is the wise mother who educates her child to perform the simple duties of home-making in conjunction with the book education received at school.

Many mothers with children only two to four years of age have told us they are keeping these recipes so the young folks will have them when they do get old enough to read and cook. Even though the lessons are to teach little boys and girls, they appeal to older folks as well. Here is one from a grandmother we want you to read:

"Dear Little Betty: How old, or young, must we be to be able to join your cooking class? Am I eligible? I am nearly 60 years old and have kept house for 40 years, but I find I can still learn. My family is very fond of caramel custard, but, like your mother says, melted sugar is the hottest thing ever, and needs to be handled with care, to prevent burns and it is a bother to make so I have not been making it so often. Your idea of putting a candy caramel in the bottom of the custard cup, instead of the melted sugar, is a new one to me, so you see, even an oldtimer like me can learn something from a new little cook like you."
—A Grandmother.

There Are Still Some Scrapbooks Left

Every little boy and girl can still get all the lessons that have been printed. They will come right with the scrap book you order. Just send 10 cents to Betty, c/o AMERICAN AGRICULTURIST, 461 Fourth Ave., New York, N. Y.

There are just lots of cold drinks that can be made with fruit juices and it's great fun to try new ones. At our house, we use most any fruit juice we happen to have handy.

Sometimes it is strawberry or currant or raspberry juice that we use with lemon to make our cold drink and then other times the cherries are ripe, or the plums, or the grapes and we use juice from them. Even wild chokecherries make a delicious drink. Most any little cook can think of some fruit, which grows wild, and pick it and, when she has washed it, cook it with water and strain off the juice that cooks out.

It never seems to make much difference what juices I use or how many different ones I put together when I have added sugar and water, the drink is sure to be good. Lemon juice makes most any fruit drink better, so I always like to put some in, but when I am using juice from sweet fruit like peaches I really need the lemon juice, too.

Sometimes mother has a little juice from sauce such as pineapple, and that is ever so good in any cold drink. So you see, there are a great many good drinks to make and I hope every little cook will think of one, a little different than any that she ever tasted before, to try this summer. This is the way I make a glass of lemonade:

- 1 tablespoon of lemon juice.
- 1 tablespoon of sugar.
- 1 glass of water.

You may like 2 tablespoons of juice and 2 tablespoons of sugar better for a glass of water and you may take that much if mother will let you.

I like orangeade even better than lemonade and for that I take:

- 1 tablespoon of lemon juice.
- 2 or 3 tablespoons of orange juice.
- 2 tablespoons of sugar or more if you like it.
- 1 glass of water.

A little ice is nice to put in if you have it because it keeps the drink cold. A slice of orange or lemon floating on top looks pretty.

Toasted Cheese Sandwiches Are Good

Have you tried buttering two slices of white bread and putting a slice of cheese between the two just as for any other sandwich and then toasting the sandwich on each side? While the bread is toasting the cheese gets all melty and it tastes awfully good, eaten hot.

We have them for Sunday night supper quite often, with pickles and cookies and cocoa.

Good-bye, until next month,

Betty

Reviewing the Latest Eastern Markets

Milk

The following are the July prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

On July 16 both the Dairymen's League and Sheffield's Producers increased the price of Class 2 milk 10 cents per hundred.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.05
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond.		
Milk Powder		
Hard Cheese	2.25	1.95

4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Slightly Higher; Trend Uncertain

CREAMERY	July 19, 1929	July 12, 1929	July 20, 1928
Higher than extra	43 -43 1/2	42 -	45 3/4-46 1/4
Extra (92sc)	42 1/2-	42 1/2-43	45 -45 1/4
U4-91 score	38 1/2-42	38 1/2-41 1/2	42 3/4-44 3/4
Lower G'ds	37 -38 1/4	38 -38 1/4	40 1/2-41 1/2

Although the butter market is fractionally higher than it was last week, the prospects for the next few days are rather uncertain. Last week the market was very much in the dumps. Early in the week ending the 20th the market continued unsatisfactory. Outlets were limited and at the same time the supplies were heavy. The sentiment in the market was unanimous for a reduction of figures. Prices broke to 41 1/2c for creamery extras. Immediately speculators got busy and from the 16th to the 18th it was a speculators' market. A lot of houses bought heavily of the cheaper goods in order to average down the cost of their holdings. When the price went to 42 1/2c however, there was an unmistakable check leaving the market barely firm. Many operators do not think well of the present situation and show an unmistakable lack of confidence at present levels in view of the light shrinkage in the make and mounting surplus of storage reserves over last year's figures.

Cheese Prices Unchanged; Tone Firmer

STATE FLATS	July 19, 1929	July 12, 1929	July 20, 1928
Fresh Fancy	23 1/2-25	23 1/2-25	25 1/2-26 1/2
Fresh Av'ge			23 -24
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	30 -32
Held Av'ge		25 1/2-26 1/2	29 -30

Although cheese prices are substantially the same as they were last week there is an undertone of firmness that leads us to expect better prices next week. Fresh State flats are held firmly and in a measure they are scarce. We hear of a

number of instances where goods are held above current quotations. Taking it all in all, therefore the situation looks suitable for an advance. The prospects are made even brighter by the fact that Young Americas are selling as high as 24c and Daisies are bringing better prices.

Egg Prices Continue Higher

NEARBY WHITE	July 19, 1929	July 12, 1929	July 20, 1928
Hennery			
Selected Extras	45 -48	42 -45	40 -41
Average Extras	42 -44	39 -41	37 -39
Extra Firsts	37 -40	35 1/2-38	33 -36
Firsts	33 1/2-35	33 -34 1/2	31 1/2-32
Undergrades	32 -33	31 -32	30 -31
Pullets			
Pewees	20 -27		-25
NEARBY BROWNS			
Hennery	38 -44	37 -42	36 -38
Gathered	32 1/2-36 1/2	32 -36	30 1/4-35

In spite of the efforts of some elements in the trade to play bear, egg prices continue to advance in the face of more limited supplies. Fancy white eggs from nearby and the Pacific Coast and nearby fancy browns are scarce. Receipts are clearing readily and the trend is upward. Just how far the market will be able to "stretch the rubber" is hard to say. Eggs are coming out of storage in large quantities and as the price goes up the out of storage movement grows proportionately heavier due to the desire of many operators to realize a good profit of a short hold. We are getting to the point now where we may expect a balancing. Shippers of fancy qualities do not have a great deal to fear because fancy fresh eggs under the circumstances that exist now will always find a good market. The shippers who are content to be classed as medium are the ones who are going to feel the pressure the most. Consequently we urge our readers to exert every effort to improve the quality of their pack to gain the advantage of the premium. At this writing 4c a dozen is easily possible. It means \$1.20 a case and \$1.20 is not to be sneezed at with feed prices going higher.

Only Fancy Broilers Are Selling Well

FOWLS	July 19, 1929	July 12, 1929	July 20, 1928
Colored	-33	-35	-24
Leghorn	30-31	-34	18-21
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	30-40	28-40	25-42
Leghorn	25-30	25-30	20-30
CAPONS			
TURKEYS	25-35	25-35	
DUCKS, Nearby	20-25	22-25	20-24
GEESSE	16-17	16-17	

Only fancy broilers are getting attention this week closing the 20th. As a whole the broiler market is in the buyers' favor. Free supplies have been arriving by truck and express to meet only a moderate demand. Where qualities were A.No.1, premiums were realized, but for the rest of the lot the man who held the "long green" was dictating terms.

The live fowl market is nothing to brag about although as the week draws to a close there is a slightly firmer tone to the trading. In general express fowls have sold on the basis of the freight market although small sales of choice stock have brought a 2c premium. The trouble with the fowl market lies in the fact that heavy freight arrivals, particularly from the South, contain a lot of mediocre birds that are acting as a dampener on the market.

Potato Market a Shade Easier

The potato market as it has been coming North has been bouncing along at a fine clip but at this writing (July 20) the bounces are getting a little short as supplies become freer. On the 19th trade failed to take hold and prices were from two to four shillings lower. Eastern Shore goods dropped 25c and Norfolks 50c. Long Islands even felt a little pressure and lost a quarter. In spite of this, however, the deal is coming into the North about 150% better than it did a year ago. Last year Long Islands were lucky to bring \$2 while this year the same qualities are bringing \$5. The prospects are that potato growers are going to recoup some of their losses of last year. It is still too early to get any definite predictions on the late crop. Prospects are good. Readers are urged to watch these columns for the next couple of weeks for a synopsis of conditions throughout the late producing regions.

Hay Market Slow

The hay market is slow. The needs of the trade are very limited. What the trade wants is No. 1 hay of which there is none. The best timothy in the market is bringing \$25 but that is no better than No. 2. Nothing in small bales ex-

ceeds \$23. Medium and lower grades continue very slow especially in small bales.

Feeds and Grains

The above quotations, taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Fruits and Vegetables

During the week arrivals of Hudson Valley black caps, blackberries and gooseberries were limited and values on fancy large tended higher. Red currants were in fancy receipt and prices averaged a trifle lower toward the close. Black currants were scarce and values were easily sustained. Red raspberries were sharply competed against by the carlot arrivals from the State of Washington. Lower prices on that account prevailed. Sweet and sour cherries averaged a shade higher toward the latter part of the week, particularly on fancy large fruit.

BLACKBERRIES—Hudson Valley: per quart basket, various varieties 25-30c; New Jersey, per quart 20-30c.

BLACK CAPS—Hudson Valley: per pint basket, best 15-18c, poorer 10-12c.

CHERRIES—Hudson Valley: sweet varieties, per four quart basket, red and black, best 75c-\$1.00, poorer 40-55c; per eight pound boxes \$1.25-1.75; per four pound boxes 75c-\$1.00; sour cherries, per quart basket, red 17-20c, black 18-22c; per four quart basket, red 75c-90c, black 75-90c; per 12 quart basket, sour, red \$2.25-2.75, poorer \$1.50-2.00, black \$2.25-2.75.

CURRENTS—Hudson Valley: various varieties, per quart basket, red 8-14c, mostly 10-12c; per 12 quart basket \$1.00-1.50; black currants, per quart basket 25-30c, few fancy large 32-35c.

GOOSEBERRIES—Hudson Valley: various varieties, green, per quart basket, best, large 25-27c, medium 20-22c; per 12 quart basket \$2.00-2.75.

RED RASPBERRIES—Hudson Valley: per pint basket, various varieties 10-23c, mostly 15-20c; Oswego County, per pint 13-20c; Washington, per pint basket 8-20c, mostly 14-18c.

Supplies of cut beets, carrots and white purple top turnips were moderate throughout the week. Good quality offerings met a fair sale at about unchanged prices. Stringbeans and Fava beans continued limited. Fancy sold well, but inferior received scant attention. Catskill Mountain cauliflower is gradually increasing in volume and improving in quality. Good quality, large sized stock sold readily while small and poor was practically neglected even at low figures. Erie County cauliflower made its first appearance of the season on Friday. The undertone of the market on celery was rather dull and prices at the end of the week were slightly lower. Heavy supplies of up-state Big Boston lettuce resulted in a decidedly weak and sluggish market and low prices prevailed. In many instances the price obtained by commission merchants was of less importance to that of finding a buyer. State green peas were sharply competed against by increased supplies from the Pacific Northwest and prices steadily declined during the latter part of the week. Romaine declined in sympathy with the lettuce situation. Spinach closed strong especially on fancy owing to the shortage in supply. Mushrooms advanced.

CAULIFLOWER — Catskill Mountain Sections: per crate, best \$3.00-3.50, few \$3.75-4.00, ordinary to poor \$1.00-2.50; Erie County, per crate \$1.75-2.00, few \$2.25-2.50; Washington, per crate \$3.25-3.50.

CELERY—Orange County: per bunch of 12 stalks 25c-\$1.00, depending upon the grade and size of stock. Offerings, in the rough, wide range pack, size, quality and condition, per two-thirds crate, best \$3.50-4.00, few extra fancy \$4.25-4.50, fair qual-

ity \$2.00-2.50; No. 2 \$1.00-1.50; half crates, best \$2.50-3.00, extra fancy \$3.25, fair quality \$1.75-2.25; No. 2 \$1.00-1.50; quarter crates, best \$2.00-2.50; extra fancy \$2.75, fair quality \$1.50-1.75; No. 2 \$1.00-1.25; High Ball crates \$1.25-3.00, according to size of crates and quality and size of celery; soup celery packed in lettuce crates 50c-\$1.25.

LETTUCE—Big Boston, wide range in condition and quality, per crate of 24 heads, Orange County 10-15c; Western New York sections, 25-75c; Oswego and Madison Counties 25-27c, occasionally extra fancy 85c-\$1.00; Iceberg type lettuce all state sections, per crate 10-25c.

ONIONS—Orange County: per 50 pound bags, yellow \$1.50-1.75, white \$1.75-2.25, red \$1.50-1.75; per 100 pound bags, yellow \$3.00-3.25, red \$2.50-3.00; per bushel hamper, white \$1.50-1.75; New Jersey, per bushel hamper, yellow, mostly \$2.00; Virginia, per bushel hamper, yellow, \$1.60-1.65.

PEAS—Madison County: per bushel basket, various varieties \$1.50-2.50, few extra fancy \$2.75-3.00; Erie County, per bushel basket, various varieties \$1.75-2.00, few \$2.25-2.50; Onondago County, per bushel basket, various varieties \$2.25-2.75.

TURNIPS—(White purple top) Orange County: cut stock, per bushel hamper \$1.25-1.75; bunched, per lettuce crate \$1.00-1.50.

Trend of the Farm Markets

Special to American Agriculturist from the Market News Service of the Bureau of Agricultural Economics, U. S. Dept. of Agriculture.

Washington, D. C.—Unsettled conditions without much net price change prevailed in the farm produce markets in mid-July. Potatoes were one of the few lines showing sharp gains. Grain and feeds also tended slightly upward and hay sold a little lower now that a good new crop is at hand. Live stock, dairy and poultry products were unsettled and generally dull.

For a while, in mid-July, the demand for potatoes exceeded the supply of country shipping points. Prices advanced above \$5 per barrel, with 100-pound sacks bringing over \$3. A year ago, barrels sold at \$1.35 to \$1.50 at Eastern Shore points. City market prices reached \$6 or more. The Boston market for Green Mountain potatoes from Maine advanced to top of \$2 per 100 pounds.

The general cheese market is nearly unchanged, but with unsettled undertone in some quarters and downward price tendency, despite some slight recovery at Wisconsin shipping points.

Demand was not active at any of the representative butter markets, but in general, trade was of sufficient volume to prevent any large accumulations. It is the gradually increasing surplus in storage which is largely responsible for the nervous unsettled condition of the market. The make of butter is showing comparatively little shrinkage.

The demand for fine fresh eggs has caused some advance in prices of leading grades. Receipts have been increasing slightly, but are below those of the corresponding weeks the previous year.

A total domestic wheat crop of about 834,000,000 bushels, or around 68,000,000 bushels smaller than last year was in prospect at the first of July. The market for feed grains has held relatively firm. Wheat feeds and high protein feeds averaged somewhat higher than a week ago and the firmer corn prices were a strengthening factor in the market for corn by-product feeds.

Prospects for the new hay crop are better than in 1928, particularly in the eastern half of the United States.

Trade on light yearlings, light steers and all grades of fat she stock is in semi-demoralized condition, the stagnation of the trade arousing some comment. Unsatisfactory dressed beef trade conditions are considered responsible for a large share of the lack of interest on the part of cattle buyers.

Hog prices at Chicago continue upward, with only slight interruptions. Shipping demand has been fairly broad early in the week, but dropped by mid-month.

Sheep and lamb markets show but little change. In a general way, the range offerings were well finished, although some arrivals at Chicago carried a long unfinished end. The native crop for the second week of July was the largest for the season to date. Range lambs topped at \$15.35 and natives at \$15.50.

The better class of combing wools show some improvement on the Boston market. French combing style wools were only moderately active at about steady prices. Clothing wools were mostly dull, a few sales being reported at slightly lower prices.

LIVE BROILERS and POULTRY WANTED

HIGHEST PRICES CHECKS SENT DAILY
Oldest Live Poultry house in New York City.
Established 1883, offers you an unlimited outlet
for your live poultry. Write for shipping tags and

Farm News from New York

Reports Indicate Short Potato and Apple Crops--County Notes

THE state and federal crop reports for July contain good news, particularly for potato and apple growers.

POTATOES—The New York State potato acreage is 275,000 acres as compared with 284,000 last year and the production is forecast at 30,814,000 bushels as compared with 32,373,000 bushels harvested last year. For the entire United States, the acreage is 87 9/10 per cent of last year's acreage. The July 1, condition is reported as 83 per cent of normal as compared with a ten-year average of 86 per cent and a total United States production is forecast at 379,290,000 bushels as compared with 464,483,000 bushels harvested last year.

WINTER WHEAT—Hot, dry weather during June has been unfavorable to winter wheat in New York State. The New York State production is forecast at 5,161,000 bushels as compared with 4,529,000 bushels in 1928 and production for the entire United States is forecast at 582,492,000 bushels as compared with 578,133,000 harvested last year.

SPRING WHEAT—The production forecast for the United States for spring wheat is 251,377,000 bushels as compared with 324,058,000 bushels harvested in 1928.

OATS—Oats in eastern sections were seeded late last spring and dry weather has hurt the crop. Conditions on July 1, are estimated as 78 per cent of normal as compared with 87 per cent of normal last July. The United States now promises a total oat harvest of 1,247,147,000 bushels as compared with 1,448,677,000 harvested last year.

FIELD BEANS—Dry weather during June interfered with planting and has resulted in an uneven stand in some New York fields. The New York acreage is estimated at 100,000 acres as compared with 80,000 harvested last year. The increased acreage is made up mostly of white varieties. The estimated crop in New York State is 1,382,000 bushels as compared with 1,160,000 bushels harvested last year. For the entire United States, the estimated production is 17,697,000 bushels as compared with 16,201,000 bushels harvested last year.

pared with 16,201,000 bushels harvested last year.

HAY—The hay crop east of the Mississippi is better than last year, but it is reported that the crop in western states is not so good. The production in New York State is forecast as 6,376,000 tons as compared with 6,439,000 tons last year. For the entire United States the production is 98,991,000 tons as forecast as compared with 92,983,000 tons harvested last year. These figures give little encouragement to the eastern farmer who is growing hay as a cash crop.

APPLES—The condition of the apple crop in New York State on July 1, was 51 per cent of normal as compared with 59 per cent of normal July 1, last year and a ten-year average of 60 per cent. The condition of the United States crop on July 1, was 53 7/10 per cent of normal as compared with 62 9/10 per cent on July 1, last year and a ten-year average of 59 6/10 per cent. The production in bushels for the United States is forecast as 154,302,000 as compared with 185,743,000 last year.

PEACHES—The peach crop in New York State is forecast at 1,775,000 bushels as compared with 2,400,000 bushels last year and a five-year average of 1,848,000 bushels. For the entire United States, the crop is forecast at 47,075,000 bushels as compared with 68,374,000 bushels in 1928 and a five-year average of 52,224,000.

GRAPES—The condition of the grape crop in New York is 72 per cent of normal as compared with 78 per cent of normal last year. The condition of the crop in Ohio, Pennsylvania and Michigan is considerably below last year, while the crop in California is much below last year's production.

MILK PRODUCTION—Due probably to dry weather and consequent poor pasture conditions which are 87 per cent of normal as compared with 90 per cent of normal last year, milk production in New York State has declined during the month of June. The production per cow based on all cows in the herd is given as 21 4/10 pounds on July 1, as compared with 22 7/10 pounds on July 1 last year. The one bright spot in the figures as given, is that 15 per cent of the cows were dry on July 1, as compared with 12 per

cent dry on July 1 last year. This may mean that there will be a larger number of cows freshening in the fall to help take care of the November shortage.

EGG PRODUCTION—Eggs produced per one hundred hens on New York State farms on July 1, were 50 8/10 as compared with 50 4/10 July 1, 1928.

Agricultural Advisory Commission Meets August 2

HENRY MORGENTHAU, JR. chairman of Governor Roosevelt's Agricultural Advisory Commission, has called a meeting of the Commission which will be held at the New York State College of Agriculture, Ithaca, N. Y. on Friday, August 2nd.

Wickersham Suggests Prohibition Enforcement Change

THERE is much discussion in the papers throughout the country concerning a letter written by Mr. George W. Wickersham, chairman of President Hoover's Crime Commission, to Governor Franklin D. Roosevelt of New York State. The letter was in answer to a suggestion by Governor Roosevelt that the Governors' Conference would be glad to discuss what states might do in law enforcement. The paragraph in Mr. Wickersham's letter which has excited the most discussion, proposes that the Governors' Conference consider a plan for approaching the Federal Government as to a division of responsibility in enforcing the Eighteenth Amendment.

Mr. Wickersham writes: "If the national government were to attend to preventing importation, manufacture and shipment in interstate commerce of intoxicants, the state undertaking the in-

ternal police regulation to prevent sale, saloons, speakeasies and so forth, national and state laws might be modified so as to become reasonably enforceable and one great source of demoralizing and pecuniarily profitable crime removed."

A diversity of opinion concerning the letter is reported among the governors attending the conference at New London, Connecticut. Governors from dry states seem to fear that the reference to a modification of state and national prohibition laws might be a concession to the wets.

Do You Know An Old Time Cobbler

MANY State Fair visitors will regret to know that Mr. John Mulberry, the old-time cobbler whose work has been an interesting feature of the agricultural exhibit for several years, will be unable to attend the Fair this fall. Mr. Jared Van-Wagenen, Jr., of Lawyersville, N. Y., is interested in locating an old-time cobbler who is willing to attend the State Fair and show how the old-time cobbler plied his trade. A reasonable wage and transportation will be furnished. Anyone knowing of an old-time cobbler who would be willing to do this should write to Mr. Van Wagenen at Lawyersville, N. Y.

Vegetable Growers To Meet

THE annual summer meeting of the New York State Vegetable Growers' Association is to be held at Geneva, beginning at 10:30 A.M. on Wednesday, July 31. Under the leadership of Director U. P. Hedrick, Professors C. B. Sayre and F. H. Hall, extensive experiments on vegetable work are in progress. There will be opportunity to see these experiments and to learn something of the results. There will be demonstrations on the control of vegetable insect and disease enemies.

New York County Notes

Cattaraugus County—LeVerne Waite was elected president, William Niles, vice-president and Mrs. Nellie Groff, secretary and treasurer of the State Grange Delegates Club at its annual meeting and picnic in West Valley. The next meeting will be held in July 1930 at the home of Floyd Rowland, Machias. The autumn session of the County Pomona Grange will be held in Dayton, Sept. 6 and 7. The Pomona officers will confer the fifth degree at 7 o'clock, Friday evening. The second week in July finds very little hay harvested due to almost daily showers. The crop is excellent especially clover as there has been an abundance of moisture all the growing season. There are 18 different places in the county where farmers can get daily weather reports.—M.M.S.

Genesee County—Officers of the Genesee County Farm Bureau Units are holding a two day officers training school at the Batavia Court House. Instruction was given the vice chairman with the work dealing with a membership campaign beginning July 20. We are having fine haying weather. Wheat is turning. The canning factories are busy canning peas. Early peas are a short crop, some too short to cut. Some fields of oats and barley are heading out. One hundred seventy members and visitors of the Oakfield and Alabama granges held a meeting Saturday evening July 8. Officers were elected and a Juvenile Grange of twenty-seven members was organized. The Grange will hold a picnic Aug. 15 at the 4-H Club rally on the Prole farm at Stafford. Many farmers are interested in Gerald Britt's potato farm at Stafford. Last year Mr. Britt was Farm Bureau Manager and this year Mr. Britt is showing people that he believes in scientific methods. His 100 acre farm is planted all to potatoes. One single field has 86 acres.—MRS. R.E.G.

Columbia County—A week of hot weather which satisfied the haymakers. Hay is a big crop this year. George Coles of Linlithgo is the Dahlia specialist of this section. His beautiful dahlia gardens are in bloom now and are the delight of tourists who journey for many miles to see them. Gravel and fine dirt are being excavated from Beaver Hill Pond, Valatie, by contractors for commercial purposes. Philmont Mills is closed for a week's vacation. Band concerts are held each Saturday night at Kinderhook. Library is open evenings at Kinderhook. A man in North Claverack had part of a finger amputated by hay fork rope. 4-H Club members of the county were guests

of Kiwanis Club at luncheon in Hudson. Hudson Rotary Club visited Cherry Orchards on Mt. Merino. Eggs are 30c a dozen.—MRS. C.V.H.

Chenango County—Crops are looking very good. Plenty of rain and warm weather. Farmers are haying and grass has improved so much in the last two weeks that the crop is good. The acreage of peas is larger than usual around here but early dry weather has hurt them and the price has been very good with the fair yield. Dairymen's League locals are all holding meetings this month in interest of fall milk production with reports of the annual meeting.—M.M.H.

Sullivan County—Farmers are very busy gathering their hay. The weather has been ideal and not much hay has gotten wet. There are many city guests at the summer resorts. Gardens are in very good condition and potatoes are reported a good crop. Eggs are 36 and 40c a dozen, butter from 42 to 47c a pound. Feed remains very high. Many farmers are not feeding as pastures remain very good. July 4 was very quietly celebrated.—P.E.

Nassau County—The first week in July was cooler here, with the fourth decidedly chilly. On the fifth we had a very light shower. Potatoes are suffering for lack of a soaking rain. Cobblers are fast dying, we are not expecting a good crop. Digging is beginning, prices are low this week. Yesterday they brought \$3.00 per barrel. Cabbage is cheaper also, bringing \$5.00 to \$6.00 per hundred. Beets are now \$3.00 per 100. Carrots are \$2.00 per 100. Radishes \$1.50 per crate of 60 to 75 bunches. We had a shower on the ninth and it rained for 15 minutes. Potatoes are full of aphids and no amount of spraying does any good. Seeds sown for second crop are not coming up for lack of moisture.—MRS. H.D.R.

Madison County—We have been having some very cold unseasonable weather. The farmers in our vicinity are just beginning their haying. It was feared that the hay crop would be a light one on account of the cold, dry weather but recent rains have brought more encouraging estimates. Corn is looking well. It looks as though we may have a fair apple crop. Eggs keep up to a reasonable price and we get good results from 2nd and 3rd year layers. The weather is more favorable and we hope for the best.—MRS. C.A.P.

Fishkill Farms on Holstein Honor List

FOR the second consecutive year, the Fishkill Farms Holstein herd, owned by Henry Morgenthau, Jr., publisher of AMERICAN AGRICULTURIST, leads the State of New York in the Holstein-Friesian honor list. The 1928-1929 year was completed on March 31st.

Places are determined by points worked out by the Holstein-Friesian World, which take into consideration production both of milk and butterfat. The largest score in the United States was made by Winterthur Farms in Delaware, scoring a total of 691 points. Mr. Morgenthau's herd scored a total of 170 points, 118 on butterfat and 52 on milk production.

It is interesting to note that the second place in New York was made by the herd of Owen D. Young, at Jordanville, New York. Many do not know that in addition to being a world famous diplomat and peacemaker, and a great manufacturer, Mr. Young also is a good farmer. Mr. Young's herd scored 167 points.

You will be interested in the names of the first twenty-five Holstein breeders who obtained high scorings in this contest, a list of which we are giving below, in the order of total number of points won by each.

Name and Address	Times Appearing	Points Fat	Points Milk	Total Points
Winterthur Farms, Winterthur, Del.	78	460	231	691

Let the Farm Provide

Even the Ice is Stored on Some Farms, Making Possible Most Appealing Frozen Dishes

A GOOD wholesome and nourishing food for summer which will certainly appeal to the family's palate is ice cream. If it is not too rich in cream or in sugar, even the small children may take it safely. A graham cracker eaten along with it helps to

B5216 is a cunning ready-made peasant frock of powder blue or aqua green voile in sizes 3, 4, 5, and 6 years. It is finished with a standing collar, deep hem and raglan sleeves, the design for cross stitching being stamped for work. Floss and rayon cord for tie are included. Price \$1.50. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

prevent chilling the stomach too fast. Sherbets made from fruit are refreshing and wholesome at this season. If the plain ice cream seems to call for any variation, stewed or crushed fruit sauce over the top quite glorifies it. A bit of orange marmalade or strawberry preserve adds a very pleasing touch of color and flavor when spread out over each serving of ice cream. The important thing is that these frozen foods be made of pure materials and handled in a clean, sanitary way. If these precautions are taken and the cream is not eaten between meals, there should be no danger of a digestive upset from it. Here are some standard recipes for ice creams and sherbets:

Neapolitan Ice Cream
2 cupfuls milk 6 egg yolks
1 cupful cream 1 cupful sugar
1/2 teaspoonful salt 1 tablespoon vanilla
Scald the milk, pour slowly on the egg yolks which have been beaten with the sugar and stir constantly so the

2723
UTILITY BAG NO. C2723 is admirably suited for shopping or for beach purposes. It comes stamped and made, except for attaching the handles which come in the form of strips. Linen colored crash is the material and when finished the bag measures about 10x13 inches. Price 45c. Address Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

eggs will not cook, but blend with the hot milk. Place in a double boiler and cook until the mixture coats the back of a silver spoon. Strain through a sieve into a bowl, chill, add the vanilla and cream and freeze.

Chocolate Ice Cream
4 cupfuls cream 1/2 teaspoonful salt
1 cupful sugar 1 tablespoonful vanilla
4 tablespoons cocoa 1/2 cupful boiling water
Dissolve the cocoa in the boiling

water and boil until the mixture is smooth and glossy, stirring constantly. Add it to the cream, sugar and flavoring. Freeze.

Philadelphia Ice Cream
4 cupfuls cream 1 tablespoon vanilla
1 cupful sugar 1/2 teaspoonful salt
Mix all the ingredients and freeze.

Caramel Ice Cream
2 cupfuls milk 1/2 cupful caramelized sugar
2 eggs or 4 egg yolks 1/2 cupful sugar
2 cupfuls thin cream
Scald the milk, dissolve the caramelized sugar in it, pour this over the egg which has been beaten with the granulated sugar. Cook over water until the mixture coats the back of a spoon. Strain, chill and freeze. To caramelize the sugar, stir it in a pan directly over the fire without adding water, and stir until it melts and becomes a light brown color.

Peach Ice
1 quart peach pulp 1/2 lemon
2 cupfuls sugar 1 1/2 teaspoonfuls vanilla
1 cupful water 5 egg whites
Put pared ripe peaches through a sieve

to plain ice cream after mixture is frozen to the mushy stage.

What the Farm Home Spends

FOR the five years 1921-25, a study was made on 54 dairy farms in the Chenango Valley to show the relation of household expenditures to the entire farm income. The Farm Economics Department of New York State College of Agriculture made the study and reported the results in the April issue of Farm Economics.

The average cash living expenses were \$774 per year. No allowance was made for value of food and fuel used from the farm. Only actual cash was accounted for. About one-half of the \$774 was spent for food, one-fourth for all other household expenses.

The average amounts spent per year were for food, \$367; clothing, \$194; and other expenses \$213. Some indi-

living in hope that some day she will both enjoy and appreciate her scrapbook.

Your friend
Mrs. J. B. M., N. J.

DEAR BETTY:
I see your name in the American Agriculturist. I have not one of your scrapbooks, so I am sending ten cents in the letter.

My father takes the American Agriculturist. We live on a farm a mile and a half from Colchester. We have twelve cows and six heifers, two hors-

Smart Sports Style

DRESS PATTERN NO. 2710 is a charming two-piece model that is feminine, yet practical. The bow neckline and swathed bodice give a touch of chic which distinguishes the blouse from ordinary patterns. The lovely printed silks, or lightweight wools are ideal for fall wear and lend themselves well to this smart design. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 1/2 yards of 40-inch material with 1 yard of 36-inch material for camisole. PATTERN PRICE 13c

es, and fifty ducks, and a hundred and fifty chickens, and three hundred chicks. I belong to a dairy club and a poultry club. Every week I take piano lessons. After school I go to Hebrew school.

M. G., Conn.

MY DEAR BETTY:
Because I like to bake better than I like arithmetic and mother does her baking by guess and as I am not a good guesser, I do certainly appreciate your recipes for Little Cooks. But please do tell us when we are "to beat it" whether to beat it with a spoon or a beater. Mother says your recipes will also help with my arithmetic. I am eight years old too.

Gratefully yours,
F. C. S., Geneseo, N. Y.

Number M 582 is a charming conventional arrangement of butterflies and blossoms done in buttonhole, outline and solid embroidery. The scalloped outer petals of the large blossoms are button-holed to the outside, then there is a plain circle and another of buttonhole stitch which again centers a small plain circle. This is effective in all white, or in white embroidery on the new tinted linens.

Wax pattern for the three piece set is number M 582 at 20 cents. Stamped on first quality white tubing cases, 40 by 36 inches, it is number M 582A at \$1.15 the pair. For a finished sheet of the same grade sheeting, 81 by 90, stamped to embroider, order number M 582B at \$1.95. Or the set of sheet and two cases mailed to one address for \$3.00 postpaid.

If interested in the new fast-color tinted sheeting and tubing, mail a request for samples and prices. Delicate pink and blue, are most popular and either one or the other will harmonize with any bedroom.

Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

until 1 quart of pulp is secured. Make a syrup by boiling the sugar with the water a few minutes. When cool, add it and the juice of the lemon and the vanilla to the peaches. Mix and then add the slightly beaten egg whites. Freeze. The vanilla may be omitted if one wishes.

Raspberry Sherbet
4 cupfuls water 1 teaspoonful gelatin
2 cupfuls sugar 1 tablespoonful cold water
2 cupfuls raspberry juice
Boil the sugar and water 10 minutes. Add the gelatin which has been softened in the cold water. When cool, add the raspberry juice and freeze.

Orange Ice
3 cupfuls orange juice 2 cupfuls water
4 tablespoonfuls lemon juice 2 cupfuls syrup
Make the syrup by boiling 1 cupful of sugar with 1 1/2 cupfuls of water 5 minutes. Cool, mix with other ingredients and freeze.

Cherry Ice
4 cupfuls cherry juice 1 quart water
4 cupfuls sugar 2 egg whites
2 lemons
Boil sugar and water together 5 minutes. Cool, add the fruit juices. When partly frozen, add the beaten egg whites.

Specials for Children
Peanut brittle or sticks of peppermint candy may be crushed and added

viduals spent more, some spent less for each of these items; that made their percentages of the total vary accordingly.

Where more went for food, a correspondingly lower proportion went for clothing and other expenses. Where more was spent for services and goods, other than food and clothing, food received a smaller proportion of expenditure. The item of clothing maintained a remarkably uniform percentage of the budget throughout.

When incomes increased, more money went for goods and services other than food—it is easy to see why this was so. The extra help and other items that go to make life easier and pleasanter would come under that head. Food is a first necessity, and clothing ranks a close second. Other things we may want and feel that we must have; so after actual necessities are obtained the luxuries get their due attention.

Betty's Letters

DEAR BETTY:
Enclosed find ten cents in stamps for which please send me one of your scrapbooks for little recipes, with the first lessons. My little girl will be only one year old on July 10, but am

How to Arrange Flowers

Even the Simplest Blossoms Can Be Made Charming in Effect

MOST farm homes have flowers—if they don't have them already, they could easily have them. On my way to the train I pass some very humble tenant houses, but the dooryards are gay with flowers.

This means that all during the growing season, at least, the inside of the house can be made more attractive by cut flowers. No matter if only a pickle bottle is used for the vase, a clever arrangement of the flowers is possible.

Here is some helpful advice laid down by J. G. Moore of the Wisconsin College of Agriculture for arranging cut flowers. If your bouquets do not look just right, perhaps you can find the reason here.

"Use a very limited number of kinds in a composition. Unless one is experienced in the arrangement of flowers, bouquets containing not more than three kinds are likely to be most satisfactory. Often a single kind of flower, either in single or mixed colors gives better effects than when shown in combination with other flowers.

Flowers are usually better when shown in rather small numbers. Large masses of flowers require large containers and much space to give good

effects. Ordinarily five or six spikes of gladioli make a better bouquet than fifteen or more spikes. The same general proportions hold with other flowers. Occasionally a single flower, as a rose, or a spike, as iris, with a setting of foliage makes a most effective bouquet.

Don't crowd. Crowding is probably the most common fault of the average bouquet. It results from one or all of the following causes: too many

trophy the unity which is desirable in interior decoration.

Try to avoid clashing colors. The art of combining colors harmoniously is quite perplexing. The liberal use of white flowers or foliage will greatly reduce the likelihood of having very objectionable color combinations. The following combinations where the colors are in different flowers and of the same intensity are usually extremely bad; orange and purple; bright red and violet; scarlet and pale lavender. Good results are usually obtained when any of the following two colors are used together; scarlet and blue; orange and blue; yellow and purple.

Lovely Lingerie Set

2619

LINGERIE PATTERN 2619 shows the tailored shorts which are very popular because of their comfort and close-fittingness. Washable radium silk, pongee or printed batistes could be used. These are easily made and make most acceptable gifts. Pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 1 1/4 yards of 40-inch material with 2 1/2 yards of trimming. PRICE 13c.

flowers; too small receptacle; plunging the flowers too deeply into the receptacle.

The beauty of flowers as shown in a bouquet lies in the perfection of the individual specimens, not in a great mass of color. Flowers crowded into a receptacle lose their individuality and become only so much color. Sacrifice numbers to individuality and openness and naturalness of arrangement and the decorative value and attractiveness of your bouquets will be materially increased.

In mixed bouquets, have one kind or color predominate. Failure to do this results in loss of character in the composition.

Flowers are usually most effective when displayed with foliage. As a rule their own foliage is preferable. If it is not available, or of too light a nature to make a good showing, use foliage of somewhat similar shape, color and texture.

Avoid the use of bouquets of several different kinds in the same room. Bouquets of many different kinds des-

Fetching Suit

2860

Emb
Trans
705

LITTLE BOY'S SUIT NO. 2860 when made up in white and sailor blue linen is delightful for wee lads of 1, 2 and 4 years. The shorts are scalloped at both upper and lower edges while the blouse shows scallops on collar and cuffs. In the four-year size this smart suit is made with 1 yard of 32-inch material for shorts, collar and cuffs, with 3/4 yard of 32-inch contrast for blouse. PATTERN PRICE 13c. Transfer pattern No. 705 (blue) 15c extra.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the summer fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Ave., New York City.

Here's saving at its best...

Save yourself!

On washday... weigh the value of a few pennies against lighter work. You'll see... it's wiser to save yourself. Fels-Naptha gives you, not more soap, but more help. The extra help of two gentle cleaners in a single golden bar. Naptha, the dirt-loosener (smell it!), and good golden soap, the dirt-remover. Briskly, busily, they work together to make your washing easier. Get Fels-Naptha at your grocer's... this very day!

The Plains of Abraham—By James Oliver Curwood

Jeems did not go to Tonteur Manor, though occasionally he heard news from the seigneurie. Twice Henri and Hepsibah made journeys there during July and August, and twice the baron rode over to eat Sunday dinner with the Bulains. It was quite comfortable at the big house, their visitor said, as he had cleared and drained the land adjoining it and, in addition to this, he had brought some newfangled cloth from Quebec with which they had made tentlike protections for their beds. Everyone was in high humour there because of the activities going on in preparation for the exit of the entire family for Quebec early in September. Toinette was going to school at the convent of the Ursulines, and now that her ambitious mother was about to launch her upon a fashionable career, fortified by the devout teaching of the nuns, Tonteur declared that he was losing the little spitfire he adored and would have returned to him in three or four years a splendid young lady all ready for marriage to some lucky blade who would not half deserve her. Jeems listened with a feeling of loss which his countenance did not betray. It was as if the fire of his dreams had not only burned itself out, but even the ash were being cleared away. For with an emotion which he made no effort to conceal, Tonteur let it be known that Toinette would not spend much of her time on the Richelieu after this, with so many things to attract and hold her in Quebec, which was one of the fashion spots of the world. Soon there would be plenty of smart young gentlemen at her feet, and he was sure that Madame Tonteur would bag the finest one of the lot for her daughter.

"You are lucky in having a boy instead of a girl," he said to Catherine. "When Jeems marries, he will bring his wife to live near you."

Autumn came, and with it a great glory in the wilderness. Jeems loved these maturer days of golden ripeness, of first frosts, of painted hardwood forests, and of crisp, tangy air when all life seemed rejuvenated and his own veins danced to the thrill of unending promises and expectations. But this year a heaviness of heart was in him with the changing of the seasons. Toinette and her people left for Quebec, and one evening, a week later, Hepsibah gravely announced that he could no longer delay his departure for the far frontiers of Pennsylvania and the Ohio, where his obligations as a trader called him. Catherine was silent for a while, then cried softly to herself. Jeems drew back where his uncle would not see him clearly. Henri's cheerfulness died out like a lighted candle extinguished by a breath of wind. Hepsibah's face was grimly set, so hard was he fighting to hold a grip on his emotion. He promised that he would never again remain away long at a time. He would return during the winter. If he failed to come, they would know he was dead.

When Henri got out of his bed to build the fire the next morning Hepsibah was gone. He had stolen off like a shadow in some still hour of the night.

CHAPTER VIII

MORE determinedly than when his uncle had been with him, Jeems continued at his work and at the mental efforts with which he was struggling to reach out into the mountains and valleys of experience ahead of him. His father came to depend upon him in many ways, and with eyes which were constantly discovering some new change in him, Catherine put greater effort into her tutoring.

Through the fall and winter the Bulain cabin was visited by wandering Indians who had learned that food,

warmth, and a welcome were always there. Jeems's friendship for them was tempered by the things Hepsibah had told him, and while he brought himself closer into intimacy with these uninvited guests, winning their confidence and making himself more efficient in their speech, he was also watching and listening for the signs of hidden dangers against which his uncle had repeatedly warned him. Most of the Indians were from the Canada tribes, and among them he found no cause for unrest, but when occasionally an Onondaga or an Oneida came, he detected in their manner a quiet and sleepless caution which told him these

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madame Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Jeems admires Toinette and is deeply hurt by her disdain. He hates Paul Tache, Toinette's cousin from Quebec, because Paul assumes a superior air and because he is in the good graces of Toinette.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems apologizes to Toinette and Tonteur visits the Bulain home where he and Hepsibah have another friendly (?) battle much to Catherine's dismay.

visitors from the Six Nations considered themselves over the dead line which marked the country of their enemies. And he made note that they always came through that part of Forbidden Valley which Hepsibah had predicted would be a future warpath for the Mohawks. Still, there seemed to be no sinister thought behind the visits of the savages, and now that his powers of observation had increased, he was impressed by the reverence and devotion with which they regarded his parents, and especially his mother. With a granary filled to the roof and dugout cellars choked with products of the soil, Henri had more than enough for his family and these wilderness guests, and never did Catherine see a brown face turn from her place that its owner did not carry a burden of food on his shoulders. This spirit of sympathy and brotherhood had its effect on the Indians until at times Jeems doubted the suspicions of his uncle and found his own mind in accord with the deeply rooted faith which was the abiding and regulative principle of his home.

This winter he went farther in his adventures. Captain Pipe, the old Caughnawaga, had a habit of spending several of the hardest weeks near the Bulains, and with his two sons, White Eyes and Big Cat, Jeems travelled to the shores of Lake Champlain for the first time. He was gone a week and planned with his friends to make a longer expedition the following year, as far as Crown Point and a place called Ticonderoga, where the French were going to build a fort some day. On this excursion he experienced the real thrill of danger, for White Eyes and Big Cat, both of whom were young braves who had won their spurs, moved with a caution which was eloquent in its significance.

True to his word, Hepsibah returned in January, coming up from the English forts on Lake George. He remained only a week and then was off again for an important consignment of goods in Albany, from which point he was going to trade among the Oneidas, if weather conditions permitted him to reach the upper waters of the Mohawk

River. This visit, though a brief one, was a relief from the monotony of Jeems's winter and added to the desire which was growing in him to accompany his uncle on one of his journeys.

With Toinette and her people away from the seigneurie, he had no hesitation in going to the Richelieu, and made trips there with his father on snowshoes; and in March, during a break in a spell of intense cold, he went alone and remained overnight in the house of the baron's overseer with whose young people he had become acquainted. This overseer was Peter Lubeck, an old veteran for whom Tonteur held a warm affection, and

through his son, Peter the younger, Jeems had his first news of Toinette. She was at the Ursuline school, and her parents had taken a fashionable house in St. Louis Street. Peter said Tonteur wrote in every letter to his father that he was homesick to get back to the Richelieu.

As another spring and summer followed those which had gone before, Jeems knew he was fighting something that had to be conquered, a yearning for Toinette which filled him with a bitter loneliness when its hold was strongest. With this feeling was curiously mingled an increasing sense of pride and resentment which at times made him hear Toinette's clear voice calling him a detestable beast and Madame Tonteur condemning his mother as unfit to be her neighbor.

For two years Toinette remained in Quebec without making a visit to the Richelieu. During these years, the tragedy of his divided birth was forced upon Jeems. There was no doubt that the English in him was uppermost or that the urge in his blood was toward the southern frontiers and the colonies of Hepsibah Adams. Yet he loved the place where he lived with a sincere passion—the Big Forest, Forbidden Valley, all the miles of wilderness about him as far as he could look to the horizons. This was New France. It was his father's country and not his mother's. Between his father and himself a comradeship had grown up which nothing could break, but his worship for his mother was a different thing, as if something besides motherhood bound him to her. His friends had increased in number. He came to know people along the Richelieu but was always conscious he was not entirely one of them. Toinette's words and her hatred for him persisted in his memory and kept recalling this truth.

Catherine did not guess that a shadow was gathering in his mind. Now that she had reconciled herself to the period of rapid development in her boy's life she was proud of his growth, both physical and mental, and her happiness continued as she saw those maturing qualities which left,

him no longer dependent upon her but made him a factor of protective strength which she had found only in her husband. No span of her life had been filled with such a fruition of hopes and dreams. Hepsibah was away for only a few months at a time. Henri and Jeems had improved the farm beyond their expectations, and in the second year half of the big slope was planted to apple trees. The creek was dammed and its pent-up force turned the wheel of a small gristmill. The chief treasure in her home, her books, had grown with every trip her brother made from the South. No mother or wife in the Colonies or New France was happier than she, and this love of life and its blessings gave to her a spirit of youth which never seemed to grow older and of which Jeems became almost as proud as his father. For them Catherine was more than a wife and a mother. She was a sweetheart and a comrade.

Late in August of the second year of her absence, Toinette returned to Tonteur Manor for a month. Jeems's heart ached with the old yearning, but he did not go to the seigneurie. The days dragged as if weighted with lead, and a hundred times he subdued the desire to make a visit to Peter Lubeck that he might catch a glimpse of her. Paul and his mother were also at the baron's and he felt a sense of relief when he learned that all of them were on their way to Quebec with the exception of Tonteur, who remained for the harvesting of crops. A fortnight after they had gone, Peter told him about Toinette and Paul Tache. He had scarcely recognized Toinette, he said. She had grown taller and more beautiful. His mother declared the nuns had accounted for a great change in her, but Peter was sure that Toinette, with all her loveliness, was still ready for a fight if one urged her to it. Peter was several years older than Jeems, and as he was to be married in December, he spoke with the assurance of one who had gained through experience a definite understanding of ladies. Tache was a full-grown man and dressed like a young noble. One with half an eye could see that he was desperately in love with Toinette, Peter avowed. But if he were a judge of such affairs, and he considered himself to be that, Tache was a long way from a realization of his desires, even taking Toinette's tender years into consideration. She granted him no favours. There had actually seemed to be a little coolness in her attitude toward him. When Jeems smiled at this information and gave it as his opinion that Toinette would marry Tache as soon as she was old enough, Peter shrugged his shoulders and declared that he possessed good eyes and ears, and that he was not ordinarily taken for a fool.

Peter's words stirred Jeems with a satisfaction which he did not let the other see, and not until he was on his way home did he pull himself from the folly of his thoughts about Toinette. Even if she were not smiling on Tache as warmly as he had supposed, he knew she was as far removed from him now as the sun was from the earth. Yet, as time went on, this fresh contact with her presence, though he had not seen her, gave a determined impetus to his plans for the future. His memories and visionings of her inspired him with a force which was frequently hostile instead of friendly, and this force demanded more of him for that reason. It was a challenge as well as an urge, something which roused his pride. It provided a furtive nourishment for the English side of the two opposing parts of him, and there were hours in which he saw himself a splendid enemy where fate had ordained,

HANDY ANDY Says "Here's How"

To Take Out An Engine Knock

By Ray Inman

have you a little spark knock in your engine? perhaps you can knock it out YOURSELF

WOULD YOU KNOW A SPARK KNOCK IF YOU SAW ONE?—PERHAPS THIS LITTLE ILLUSTRATION WILL HELP:

GREETINGS, JONES! SO AM I!

IF YOU CAN FIND THE SPARK KNOCK IN THIS PICTURE, YOU CAN FIND IT IN YOUR CAR.

WHAT IS THE DIFFERENCE BETWEEN A SPARK KNOCK AND A KIPPERED HERRING? WE PUT THIS VITAL QUESTION TO THREE PROMINENT MEN. HERE IS WHAT THEY HAD TO SAY:

OLIVER J. COOLIVER: "THE HERRING HAS MORE BONES"

PHINEAS P. O'PHIMICK: "SPARK KNOCKS ARE SELDOM KIPPERED"

ABELD DABADAB: "WHO BROUGHT THAT UP?"

a spark plug projecting too far into cylinder, or one with a sharp point on it can cause PREIGNITION.

EVER BOTHERED WITH PREIGNITION, WALTER?

NEVER HAD A SICK DAY IN MY LIFE, ALBERT.

locate cylinder that makes the trouble and try a new spark plug in it.

WHEN A CYLINDER MAKES TROUBLE:**① YANK IT OUT!**

PICTURE OF DENTIST YANKING TOOTH, [IF THAT WILL HELP.]

② REMOVE REAR DOORS AND ADJUST FAN BELT ACCORDINGLY.

PICTURE OF MAN REMOVING REAR DOOR. [A VERY EFFECTIVE METHOD]

③ IF DANDRUFF STILL PERSISTS CONSULT NEAREST TELEPHONE DIRECTORY

MEETING OF A BOARD OF DIRECTORIES

sometimes a sharp projection on an exhaust valve is the cause. If so, file it off.

DIDJA FIND THE SHARP PROJECTION YE WAS LOOKIN' FOR, OWEN?

LIVESTOCK BREEDERS

Fishkill Farms

Offer for sale a grandson of
**Dutchland Colantha
Sir Inka**

One of the greatest sires of the
Holstein breed.

This young bull was born July 15,
1929. His dam is

Lady Inka Daisy Ella

At 4 years and 1 day of age this
cow made a record in Class B of
17,154.4 lbs. milk and 644.75 lbs.
butter in 305 days carrying a calf
202 days.

This young bull is sired by

**Fishkill Sir May
Hengerveld DeKol**

whose sire is also a grandson of
the Dutchland Colantha Sir Inka,
out of a 30 lb. 4 year old.

We are offering this fine young
bull at \$100.00, provided he is
purchased before he is 30 days
old.

For pedigrees, terms of sale,
etc., write

With Gov. Roosevelt on the Barge Canal

(Continued from Page 1)

during the last decade. The whole canal
shows an increase of 19.61 per cent
over the previous year. You can see,
however, that we have not yet begun
to use the resources of the canal, when
we consider the fact that it is capable
of floating 20,000,000 tons per year.

It seems strange to see a load of
Oregon lumber floating alongside of us
and to know that this lumber had taken
the long trip down the Pacific, through
the Panama Canal, then up the Atlantic
Ocean and the Hudson River to Al-
bany, and then finally across the State
through the Barge Canal. It is some-
thing to reflect upon also when we see
this Oregon lumber to remember that
New York State once was one of the
leading producers of lumber in the
United States.

The largest single product which is
shipped on the canal is wheat. Over
1,000,000 tons of wheat were trans-
ported last year. The next most im-
portant commodities are gasoline and
oil. Other products handled in large
quantities are iron, sugar, barley,
paper, brick, fertilizers, pulp-wood,
coal, sulphur, sand, stone and gravel.
The largest single gain in any one com-
modity was made in grain.

The Day's Routine

While on this trip, Governor Roose-
velt led a very strenuous life, notwith-
standing the fact that his boat seldom
made more than ten miles an hour.
He would start the day with breakfast
at eight o'clock. Then came the careful
reading of the morning newspapers. By
this time, Mr. Cross would have the
Governor's correspondence ready to
read and answer, and this would oc-
cupy his time until noon. At every lock
we would be met by a crowd of men,
women and children, who were not sat-
isfied until they had seen the Governor,
and, in many instances, shaken hands
with him.

I remember one instance where a
woman over eighty years old came and
told him how she had been born at sea
and had come up the old Erie Canal
when only one month old, and had lived
on the edge of Montezuma Marsh ever
since. It is interesting to think what
has happened in America and in the
world in the eighty years since that
woman made her trip over the old Erie.

After luncheon the Governor would
have an interview with newspaper cor-
respondents, who accompanied him on
a second boat called "The Chief." Some-
how or other, it worked out that we
almost always arrived in the early
afternoon at some point near a State
institution. Then the Governor would
leave the "Inspector" and get into his
car to visit the State institutions in
the neighborhood.

The Demands of Public Office

During the three days that I was on
the trip, Governor Roosevelt never fin-
ished working before twelve o'clock at
night. This is not only the case with
him, but with other governors most of
the time, when they have been on duty
at Albany. The demands of a great pub-
lic office on the time and energy of its
occupant is almost beyond physical en-
durance, and the exacting duties of
such a position are also a test of a
man's good nature and character. Few
people realize the responsibility resting
upon the governor of a great state like
New York. Yet in spite of this responsi-
bility and the exacting and worrying
cares of his office, Governor Roosevelt
is the same amiable, patient and sym-
pathetic gentleman from eight in the
morning until twelve at night. Every-
body he saw received the same kind of
treatment, whether he was the Mayor
of Utica or a man from Pennsylvania,
who told the Governor he had voted for
"Teddy" Roosevelt.

The Governor has a plan by which he
hopes to interest some philanthropist
in running a passenger boat which will
make a round trip from New York to
Albany and from Albany to Buffalo on
the canal, and then up the St. Law-
rence River to Montreal, down through
Lake Champlain and back again to Al-

bany. If such a boat were available, the
Governor believes that many people
would be glad of the chance to take a
ten-day trip through New York State
by boat, provided of course that the
rates were reasonable. What a splendid
opportunity such a trip would be to
get a comprehensive idea of what the
Empire State really is like.

I came back from this trip on the
Barge Canal with the distinct impres-
sion that the canal is again gaining
in importance and that under the di-
rection of Colonel Greene and Major
Farrell it is well and efficiently run. It
is rendering a real, economic service
to the people, and indications are now
that its tonnage is going to continue
to increase and that all that is lacking
is a better knowledge and appreciation
on the part of the people and of ship-
pers of its real possibilities.

Indemnities for Tubercular Cattle

Will you kindly advise me the maxi-
mum amount which can be paid for con-
demned tubercular cattle by both the
state and federal government for both
grade and registered cattle?—A.C.F.,
New York.

LAST spring the federal allowance
on tubercular cattle was increased
so that now there is available, \$35.00
for grades and \$70.00 for pure bred.

Over a year ago the indemnity in
New York State was raised about 25
per cent so that now \$90.00 is avail-
able for indemnity on grades and
\$150.00 on pure bred. At the same
time, there is a provision in New York
State law which says that no animal
shall receive more than the appraised
value.

This is the way it works out. The
owner first gets the salvage value and
then gets state funds up to the ap-
praised value, but not more than \$90.00
for a grade and \$150.00 for a pure
bred. If these sources are not suffi-
cient to bring the sum up to the ap-
praised value, then the money from
the federal government is made avail-
able. In a certain sense there is no
limit on the amount a man can get
from a reactor.

With a purebred animal, the limit
from the state and federal government
is \$220.00. The possible limit which
dairymen might get would be this sum
plus whatever salvage value the ani-
mal would bring. We understand the
average salvage value is about \$30.00.
In dealing with these figures it should
be understood that the owner can
never get more than the appraised
value while at the same time in certain
instances the money from three sour-
ces, namely salvage, state funds and
federal funds may not be sufficient
to equal the appraised value.

The Plains of Abraham

(Continued on Page 12)

that he could not be a friend. With in-
creasing maturity giving to him a deep-
er and more understanding passion for
his mother, and a fuller comprehension
of the noble qualities in his father, he
was harassed by a conflict of emo-
tions which he revealed to neither, and
confided only in Hepsibah Adams. The
difficulty of solving the problem which
confronted Jeems was as great for
Catherine's brother as it would have
been for Catherine herself, for as early
as the spring of 1753, when Jeems had
passed his sixteenth year, there was
no longer a doubt in the minds of the
people of the Colonies and New France
as to the surety of the struggle which
was impending. While France and Eng-
land were officially at peace, the forces
of the two countries in America were
on the verge of open war and were in-
stigating the Indians to a strife of ex-
termination.

Real Estate Agent Charged With Fraud

IF the testimony of Joseph E. Post, formerly owner of a farm near Kingswood, N. J., is true and all the facts in his case charging August Zwicker, with fraud are correct, the newest scheme for defrauding farm owners will be brought to light next fall in the Hunterdon County courts. Zwicker, who is a real estate agent with offices in Flemington and New York City, was held in \$500 bail following a hearing before Justice of Peace George Webster Tuesday morning. Edward P. Slattery, Zwicker's son-in-law and partner in the business, is also held in \$500 bail to await the action of the Grand Jury next September.

Post and his wife owned a 50-acre farm which they offered for sale about a year ago. Zwicker made some preliminary visits, according to the testimony, and later brought Slattery, who posed as a wealthy man of the metropolitan area who wanted a country home for the summer, offering to exchange some revenue producing city property for a desirable country place. Post claimed that Zwicker made many extravagant claims as to the income to be gained from the property, which is located in Jersey City, through rentals to tenants. The city property was offered at \$21,000, Post placed the price of his farm at \$11,500, but Zwicker requested him to add at least \$1,000 "because Slattery is rich," according to Post's testimony.

The deal was completed in August, 1928. Shortly after Post took possession of the Jersey City property, he discovered that the rental income was not as great as that claimed for it by Zwicker. An informative janitor explained to Post that Slattery was Zwicker's son-in-law, and not the wealthy young man who was looking for a summer home as was claimed.

An examination of the papers in the deal was made by the Wolfe Realty Co., and Mr. and Mrs. Post were advised that the case was one to be handled by a prosecutor rather than a real estate agency. The Posts have since moved to Stockton, where they have been known for twenty years or more, and recently began proceedings in Hunterdon County.

Bond was first set at \$3,000 for Zwicker, by Justice Webster, but this amount was reduced to \$500 by Judge Robbins. Zwicker and Slattery were served with warrants immediately after the hearing, but they were prepared to furnish the necessary bond. They were represented by H. L. Stout, Sr., of Flemington. Post retained J. I. Jaffee, of Passaic, and Richard Davis of New York City, as his attorneys.

Seed Associations Expel Members

THE Farm Seed Association of North America has just requested the resignation of The Ackerman Company, Lima, Ohio, and the Hooten-Davis Seed Company, Lebanon, Indiana who were found guilty of conducting their business in an unfair and improper manner. At the same time the American Seed Trade Association has expelled the Gurney Seed & Nursery Company, Yankton, South Dakota.

Most companies selling seeds are thoroughly reputable. Due to the fact that a farmer's crop is largely dependent upon the quality of seeds he sows, we are glad to see these seed associations take action to maintain fair standards of business.

Deducts \$8 for Carting Own Broilers

Can you help us get settlement from Newark, N. J. This man with his truckdriver came to my place and bought some broilers for 31c at the farm. Later I found that others

were paying 36c but I had promised them to him, so I let him have them. Ten days later a check came and I found he had taken out \$8.00 for carting.

We have called this to his attention several times but he pays no attention to notices sent him. He is buying a lot of eggs and chickens from farmers in this section and we certainly do not feel we have had a square deal from him.

THIS letter emphasizes the importance not only of knowing the reliability of the man to whom you sell but also of knowing the market price of your stuff and insisting on cash when the stuff is bought, unless you

are absolutely sure of the reliability of the man to whom you are selling.

Free Lot Scheme Still Active

I am enclosing the Alta Development Co. letter that I received today. Is this firm reliable?

THIS scheme is an old one which has been worked successfully for years. They are asking you for \$39.00 for "expenses" to get a lot and all you have is the word of these people for the fact that it is worth \$250. I do not find any mention made in their letter as to the size of the lot, but undoubtedly you will find that it is too small to erect a building and it would therefore be necessary to buy an adjoining lot before it can be of any use to you.

From our past experience we are convinced that the price of the adjoining lot is likely to be all or more than the two lots are worth, consequently the word "free" will hardly apply to your prize.

When the Grain Binder Fails to Bind

(Continued from Page 3)

bills. In this condition it is advisable to get new parts.

When the twine is found on the bills as illustrated in figure 7, it indicates that the bills are too tight. Consequently, when the bundle is kicked out, the bills fail to release the knot and the string is broken by the bundle. The remedy is to loosen the tension on the bills or to adjust the head to form a tighter bundle. Once in a while the stripper which removes the knot from the bills after it is tied has been bent so that it fails to function. In this case, of course, it should be bent back or a new one substituted.

Needle Can Be Bent

The condition illustrated in figure 8 may result from a number of causes. First, the needle may not travel far enough to place the twine in the disc notch. This can be remedied by shortening the needle pitman, which will cause the needle to advance further so that the twine disc will grasp the string. Second, if the twine tension has habitually been kept too tight, it may result in a badly worn needle eye, which results in failure to place the twine in the disc. This wear can be repaired by welding, by shortening the needle pitman rod or by replacing the worn needle with a new one. Third, the needle may become bent. It is made of malleable steel so that it can be straightened by slipping a piece of gas pipe over the end and bending it back into its proper position. Fourth, sometimes when grain is cut rather low, weeds and other trash are carried up by the needle and interferes with the proper action of the twine disc. This can be remedied by cutting the grain higher.

The knot illustrated in figure 9 is a perfect knot. Some binders tie a knot which does not have the loop as here illustrated. The extra loop of course takes more twine but some manufacturers feel that it is a better knot.

Know Why Before You Make Adjustments

When a binder fails to tie a perfect knot, the operator should immediately stop and study the condition of the binder before attempting to make any adjustment. As soon as the condition of the twine has been studied and a decision reached as to what is wrong, a slight turn of the proper adjusting screw should be made. As soon as another bundle has been thrown out, stop and see whether it is functioning as it should. If not, study the twine again and give the proper screw another half turn. The trouble with making two or three turns of any adjustment screw at one time is that the adjustment may be carried too far the other way, with no improvement in results.

Anyone who has studied a knotter should be able to make all necessary adjustments before one trip has been taken around the field unless, of course,

some part has been broken or is so badly worn that it must be replaced.

These Dairymen Have Improved Their Herds

(Continued from Page 3)

tell which cows to raise calves from. Yearly records are the only records that count. Then, too, if you want to sell your pure bred bull calves you must have records of their dams. Our herd production stays about the same but we have several heifers milking in the herd that have kept the average down. If we were milking all mature cows it would be better.

* * *

Figures Tell the Story

By HENRY S. NICHOLS
Curriers, N. Y.

MY experience in dairy improvement Association, or as it was called at the beginning, cow testing association, covers a period of about twenty years. There have been short intervals during that time that we were not testing but it is our intention to keep close account of what each cow is doing for the full year and what profit she is making. Testing is the only way to really know.

Association records are being recognized as valuable in the purchase of cows or their offsprings. In fact dairying, as well as other professions, is becoming more and more scientific.

In going back over a period of ten years we find in our Herd-Record Books that in 1917 the average production of twenty-three cows was 301.2 lbs. of butter fat, and in 1927 we were awarded a National Honor Roll Diploma in recognition of the achievement of developing a herd of twenty-nine cows to a yearly production average of 459.1 lbs. of butter fat. During this time there was a complete change in the herd but very few were purchased. What few cows and sires were bought the records of their ancestors were considered of great value.

We are sure that testing is a very worth while part of our business.

* * *

It Helps in Selling Surplus Stock

By W. W. FORTUNE
Essex, N. Y.

IN January 1924 we started the Essex County Cow Testing Association. I have been a member each year and know it has been a success. In a purebred herd it helps to sell bull calves. I have sold all of mine since belonging to the Association. It helps to sell the females as well, and gives you a line on what the herd sire is doing to raise the production of the herd.

I believe the best use of testing comes to the grade herd in showing up the boarders, and in better feeding. It's pretty hard to feed economically unless you know what each cow is giving. Most men take better care of the herd after testing and are interested in raising the heifer calves from the best cows. It also helps in selling surplus cows—the good ones bringing better prices and the dealer can't pick out all the best ones and leave the culls. The cost compared to the benefits is small and every owner of five cows should be a member of the Testing Association as it is money well invested, and one of the best ways to improve a herd that I know of.

A Gestation Chart

WE recently received in the office a gestation and incubation card which it would seem would be of value to any livestock breeder. It is mounted on cardboard about nine inches square and in the center is another circular cardboard disc containing the gestation time of all live stock, together with a number of little windows which disclose the dates underneath. One of these windows is put to cover the dates served and the other window gives the dates due. This table is copyrighted by William Wahlund, 331 East 77th Street, New York City and sells at retail for 25c.

"Easy to Adjust"

Leading Farmers Everywhere give this as one of the Reasons why they like McCormick-Deering Tractor and Horse Plows

EAST—WEST—NORTH—SOUTH—everywhere you go farmers say "We like McCormick-Deering Plows because they are easier to adjust." The owners of the McCormick-Deering Little Genius, the Little Wonder, and the Tractor Disk Plows for all conditions—all of them are strong for this feature of McCormick-Deering Plows.

Farmers using horse plows such as the Diamond High-Lift Sulky, The Success (sulky and gang), the Two-Way Sulky, the No. 9 Sulky, McCormick-Deering Disk Plows, and

It means a lot to be able to get into the fields and do a fast job of plowing with a plow that's made right from the start. AT LEFT—A few simple adjustments and your McCormick-Deering Plow is ready for good work and plenty of it.

Walking Plows—they, too, point out the ease of adjustment and the time saved as one of the big reasons for their choice.

Ask the McCormick-Deering Dealer near you to arrange for you to see

one of these good plows in action—see for yourself how easy it is to keep it in the ground—to make it free of sway and side-draft—to plow straight, deep furrows—to make it turn and scour. Find out how easy it is to do a good job with a McCormick-Deering Plow.

The Question Box

Crop and Fruit Problems That Trouble Readers

I have a quince tree about ten or twelve years old but it never had any fruit on it. I've heard some say you can make them bear fruit, but at the time I wasn't interested. I wonder if you could tell me what to do.—A. S. B., *New York*.

WITHOUT more information concerning the conditions surrounding this tree it is impossible to give you any very definite information. Quinces unfavorably located are quite frequently injured by late spring frosts resulting in little or no fruit. Often the new shoots are affected by blight which results in the fruiting portion being killed. If the tree is not sprayed, any manifestation of scab may so weaken the tree that it will not set fruit.

Many of our apple varieties as well as varieties of other fruit trees require cross-pollination to be fruitful. So far as I know, no work has been done concerning the requirements of the quince in this respect. If your tree is in apparently good vigor and blossoms well, I would expect that a lack of cross-pollination might be the trouble. One of the members of our department is planning to do some work with quinces this year in order to determine its pollination requirements.—G. W. Peck, N. Y. State College of Agriculture.

Sod or Cultivation for Orchards

Where labor is not available to cultivate an orchard continually through the season, would it be possible to leave it in sod or would it be advisable to plow and cultivate once only?

APPARENTLY more attention has been given recently to sod orchards and a number of growers have followed this method with success. One of the essentials under sod culture is that the orchard be fertilized with some quickly available nitrogen carrier. On the other hand where it seems advisable to cultivate an orchard early cultivation is most important.

It has been stated that one plowing and one cultivation early in the season is equal to an application of five pounds of nitrate per tree. It has been found that it is not essential to keep the ground clean very long as the weeds make a fairly good cover crop and add to the humus content when they are plowed under the following year.

If you are convinced that cultivation is the best for your orchard, we think that plowing and one cultivation will give fairly good results although we would advise stretching a point and cultivate twice, if possible.

Winter Injury of Cherries

Last summer the leaves of the cherry trees dropped early in the summer without any apparent reason. Can you tell us what disease caused this, and how it can be controlled?—H. L., *New York*.

IT is believed that rather serious premature dropping of leaves in the cherry orchards last summer was caused by winter injury during the previous winter, combined with a severe outbreak of leaf spot.

It is believed in some quarters that the effects of this will be felt for years, and a number of trees will probably die. It is suggested that proper cultivating with a disc, rather than a plow, and judicious pruning may reduce the loss from this cause. The spray schedule recommended by the New York State College of Agriculture will control leaf spot and other diseases and insects on cherries.

The Cause of Moldy Silage

What causes mold in silage and how can I prevent it? Is it dangerous to feed this silage?

THERE seems to have been more than the usual amount of trouble with mold last winter. It is easy to explain why it happens, but not so easy to tell how to prevent it. The mold occurs where the acidity of the silage does not develop properly, and this usually happens where the water content is too low. Mold is more likely

to develop where the corn has been frosted or where the silage has been made from corn which has been allowed to lie in the field after cutting. Where the corn is dry, it is advisable to add water, although it is not as satisfactory as the natural corn juice. Mold will not live in the entire absence of air. Another factor is the manner of cutting the silage. Fine cutting, of course, enables it to be packed more closely and lessens the danger of trouble from mold.

Moldy silage should not be fed horses or sheep, and there is some evidence that it may harm cattle. If it occurs in spots, we suggest that as much as possible be sorted out and the remainder fed to the cows.

Where Flies Breed

HAULING manure to the fields every day in the year when weather permits is a good dairy practice, and it pays especially well in summer time. Manure more than one or two days old is an excellent place for flies to breed and multiply, and flies are a serious menace to milk sanitation.

Experiments in Ohio conducted over a period of more than thirty years show that manure was worth sixty-five cents more per ton hauled direct to the fields than if it were allowed to remain four or five months in the barnyard.

Home Grown Cabbage Seed

Will you give some information about home grown cabbage seed? I have several pounds of very nice seed which I grew last year. I have been told, however, that such seed will not reproduce true to type, will not head well.—B. O., *New York*.

THE value of cabbage seed which you grew last year depends upon a good many factors. In the first place, was it grown from plants which were carefully selected for excellent type? There are very good stocks of cabbage seed on the market and it would not

pay you to plant your own seed if seed which you could buy would give you materially better results. In the second place, was the seed grown far enough away from other blossoming plants of cabbage or related species to avoid crossing? We are told that a space of 160 rods is desirable to insure freedom from crossing.

The advantages and disadvantages of growing your own seed are discussed in Cornell Extension Bulletin 122, copy of which I am sending you. The advantages are certainly very material and a number of New York growers have done very well with cabbage. On the other hand, the job is rather exacting.—Paul Work.

Sprouting Broccoli

Can you give us some information about growing and marketing Italian Sprouting Broccoli?—A. S. B., *Long Island*.

A GREAT deal of Italian Sprouting Broccoli is being shipped from various southern points. Much of it is

Hogs Win Quack Grass Battle

IHAVE had some experience with quack grass. Six years ago a farm in Michigan came into the family and I went out there to look after it. In the spring I found three good sized patches of quack. And here is as good a place as I know of for a little free advice. If you are considering buying a farm in a new or strange locality, never close the deal in the winter time; for then, when quack, wild morning glories, et cetera, are covered with a blanket of snow is a wonderful time to pass a white elephant off to some unsuspecting stranger.

Well, one of these patches of quack was about thirty rods from the barn and had reached alarming proportions. It was handy so I decided to do some experimenting. The field was new seed-

ing which we needed for hay so I wanted to do something that would not disturb the field too much. We soaked some salt up in barrels drew it back on the stone boat and gave that quack a good drink of brine. But instead of turning up its toes it seemed to take kindly to such treatment—I never saw anything do so well in my life.

Cultivation Fails

That fall the field was broken up for corn with the very best intentions of killing that quack with a cultivator and hoe. That was a foolish resolution for I always have been inclined to hold a grudge against the man who invented the hoe. Well, I never have been able to decide which did the best that year; quack and thistles or the corn and that in spite of the fact that the grass was hoed three times.

The next year we planted oats and seeded it to alfalfa. I know of nothing that will kill thistles quicker than alfalfa; they just can't put up with being cut three times a year. Well, with the help of some fertilizer the oats did fairly well—and so did the quack. About that time I was visited with another bright idea. I didn't want that infested straw worked up into manure so we threshed the oats in the field and put the straw on top of the patch of quack to smother it out. I pretty near broke my arm trying to pat myself on the back. But—the next year the straw pile had started to rot down and quack was showing around the edges. I hauled more straw and covered it up but it was no go; the grass ran along on top of the ground just under the straw out to the sun light. Instead of killing the stuff I was making the patch bigger.

Pigs Do the Trick

About that time I began to get really interested and slightly worried. I didn't want to break up the alfalfa and I wanted to kill that grass. Then I was afflicted with another idea. It may sound foolish but it killed the quack and carried its lesson.

We hauled one of the portable hog houses back there and fenced it in with rails. Then we cut the rings out of all four brood sows and drove them back. We took feed and water back to them in barrels on a stone boat. Feeding those hogs was the dickens of a job. It seemed as though every time I was in a hurry they would be squealing for something to eat. But they stayed there all summer and with a little shelled corn to coax them along they kept that ground moving. The quack met its Waterloo and all those hogs did was summer fallow that piece in a most thorough manner. Summer fallowing will kill foul stuff and is good, in fact very good, for the land.—D.C.M.

Before and After

HOW often we see a collection of mail boxes at a cross roads and how often they appear much as those in the above illustration. The illustration below shows how easy it is to arrange them in a neat row. All that is needed is one board, three posts and a bit of cooperation.

When Dogs Injure Your Livestock

How Recent Changes in the New York State Law Affect Indemnity Payments

FOLLOWING the recommendations of a committee headed by Assemblyman D. P. Witter, the New York State Dog Law was revised at the last session of the legislature. The recommendations for changes were made after a careful study of the whole problem and in general, the new law was favorably received by residents in rural sections, particularly by sheep owners. On the other hand, there was a storm of protest from sportsmen. Although the bulk of these protests came from the city, there were a few from the country. The following letter illustrates one viewpoint:

"Please take up with the authorities at Albany, the question of the use of cow or watch dogs on farms. Just why we should be required to pay a tax on dogs when we cannot use him and must keep him tied up is something we cannot understand."

This particular letter came from a county where a night quarantine was in effect, the provisions of which will be discussed in detail a little later. Other letters protest against the provision of the law, allowing any person to kill a dog which is found to be worrying or chasing farm animals. This, it has been stated, allows any person to kill a dog regardless of whether or not he has a license tag, if he is found even following a hen.

New Law An Improvement

AMERICAN AGRICULTURIST feels that the changes in the dog law are justified and that as the law now reads it is a distinct improvement over the previous law. We also feel that the enforcement of the law should be handled in a common-sense manner. We thoroughly sympathize with the sheep owner who finds his entire flock practically ruined over night, but at

the same time, we doubt whether it helps the situation any where the landowner kills every dog found on his property.

As the law now stands, the Town Board appoints one or more enumerators who prepare a list of dog owners in the town. This was done during the month of June this year but hereafter it will be done in December. These enumerators make up a list of the names and addresses of dog owners, together with the number and sex of dogs owned and one list is filed with the Town Clerk and one with the Department at Albany.

Fees Required

This year, dog owners were required to get licenses previous to July 1, which will be effective until January 1. Hereafter the licensing year will be the calendar year. Licenses are required except on dogs under the age of six months which are not allowed at large and the fee is \$2. plus 25 cents for tag fee for each male or spayed female dog and \$5. plus a 25 cent tag fee for each unspayed female dog.

On the 10th of August this year and on the 10th of February hereafter, each Town Clerk is required to report to the Commissioner of Agriculture and Markets, the names of all dog owners who have failed to obtain licenses. Following this, action is taken to require each owner to take out a license or to collect a penalty of \$10. for failure to do so.

Perhaps the principal change in the law of interest to live stock owners, concerns the method of appraisal and the payment of damages. Where domestic animals are attacked or injured, the owner should immediately notify the nearest assessor. The assessor examines the animals injured or killed and gets all the evidence available,

including evidence as to the owner of the dog so that damages may be recovered from him if possible. He then makes out a report on a form prescribed by the Commissioner. If the damage appears to be more than \$50. the assessor shall notify the other assessors and they, or a majority of them, shall inquire into the matter within three days and report as to the damage sustained.

This report is filed in the office of the County Treasurer and a copy delivered by the assessors to the one claiming damages. In case the live stock owner is dissatisfied he may appeal to the Commissioner within ten days and the same privilege is accorded to the County Treasurer in case he is dissatisfied. At the time the appraisal is made it must be only for damages apparent. If further damages become apparent later, a supplemental notice of claim may be given to the assessor or assessors within six months of the original claim.

Owner Now Sure Of Indemnity

Under the old law, the only money available for paying claims, was the money received from dog licenses. The new law states that each county shall be liable for damages done within the county by dogs to domestic animals. This means that if the fees from dog licenses are not sufficient to pay indemnities, the county must provide money from some other source.

When the dog law was up for discussion last winter at Albany, protests from sportsmen centered on the provision of the law which allowed anyone to kill a dog found chasing or worrying live stock. As a matter of fact, there was little or no change on this provision, but apparently many dog owners were unaware that this provision was in the law. In the first place, the

Ideas Pay Dividends

How One Poultryman Keeps Information Where It Can Be Found

By F. E. KUNKEL

HOW to catch and use ideas for more profitable poultry raising is a problem solved by one poultryman, who found that ideas were elusive and so he developed a simple idea file to gather in and store poultry plans, methods and ideas of all kinds that he ran across in reading books, magazines and pamphlets.

His experience is no doubt typical of a host of other poultrymen, who face the same perplexing problems of laying their hands on good ideas quickly when they want them.

This poultryman would read good articles in the daily press, in poultry journals, in pamphlets, in farm and home journals, and at a later date when some problem came up he remembered that he had read some article about it, but couldn't remember where he saw the particular article which had so struck his fancy, and then he would have to dig through a pile of magazines and newspapers in search of that single idea. Sometimes he couldn't find it, so he decided to start an idea file so he would have everything at his finger tips.

After that he clipped all advertisements and articles which interested him in his reading and filed them away in large manila envelopes. In this way he soon had a lot of good ideas at his finger's ends whenever he wanted to refer to them.

He liked this system so much that within a year's time he changed the system and enlarged on it. He hunted up a dozen shoe boxes and pitched

his clippings into them instead of the envelopes. As he put his clippings into the box he would write the name of the article on the outside cover of the box.

Later he bought a cheap wooden filing case at a stationery store and some filing folders. Now he has a regular file cabinet chuck full of profitable ideas concerning poultry raising. The file is arranged in alphabetical order by subjects, and he says it is the best little gold mine on his plant. He has data on every subject under the sun concerning poultry raising.

The folders in his file are full of notes, clippings, comments and index references to poultry

practices and principles, diseases and how to treat them, appliances, feeding, breeding, housing, egg production and marketing, poultry shows, baby chicks, and about chickens of all varieties. He also has a small library of books on the subject. Each chapter is indexed on a piece of paper and this is filed in the idea file for quick reference to the book, page, etc.

This poultryman is constantly drawing on this data for suggestions and ideas which he can apply to his daily problems of raising poultry at a profit. The value of such an idea catcher becomes apparent when you consider the wide range which it may cover. All one has to do is to get in touch with all possible sources of information and keep a pair of scissors while he reads. There is a wealth of information at hand, awaiting collection and organization. New ideas are being constantly evolved by other poultrymen which sooner or later find their way into print and so become available for application to one's problems. One idea or plan often suggests another, or is father to a trend of thought which enables one to put over another idea or plan. A well organized idea file keeps these plans and ideas, developed in the poultry field, always on tap, readily available upon call.

The systematic collection of ideas will make them available in time of need, and the task of gathering them is simple. If you are interested in having such a file of your own you

Farm Relief and the Price of Wheat

AT one time this summer wheat was selling for less than \$1.00 a bushel, a low price record for many years. At the present time, July wheat is quoted at \$1.45. What caused this big gain in so short a time?

Some say it was the effect of weather conditions on the crop now being harvested; others believe that the increase in price was caused by the recent farm relief legislation passed by Congress. As a matter of fact, both weather and the farm relief law have helped to raise the price of wheat.

There is no doubt that the temporary effect of the work of the Federal Farm Board will be to raise prices on many farm products. What we fear is that the better prices will increase production and the surplus, and result in disaster in the long run. Maybe the Farm Board will find a way to prevent it. We hope so.

President Proclaims World Peace Pact

VIEWED from the standpoint of humanity, the most important meeting probably ever held took place in the East Room of the White House on July 24, when President Hoover proclaimed the Kellogg World Peace Pact in force. Representatives of forty-three nations attended the ceremony. Ex-Secretary Kellogg, author of the pact, was present and also ex-President Coolidge.

President Hoover delivered an address and congratulated those present and the nations represented and the "entire world on the coming into force of this additional instrument of humane endeavor". He predicted that the "influence of the treaty would be felt in a large proportion of all future international acts". The situation was very dramatic and tense as the President read the treaty pledge and in slow, deliberate terms told of its far-reaching effect.

As immediate proof that the treaty was no mere "scrap of paper", the President also announced the suspension in building of three cruisers in this year's construction program, which have been undertaken in the government navy yards. Premier MacDonald had already announced in the British Parliament the suspension and general holding up in the building of English warships.

Mr. MacDonald has announced his intention of visiting the United States in October in order to consult with President Hoover on a gen-

eral program leading to at least partial disarmament in Great Britain and in America. President Hoover regards Premier MacDonald's statement to the House of Commons as marking a "new departure in the discussion of naval armaments."

"The Prime Minister," said Mr. Hoover, "introduced the principle of parity which we have adopted, and its consummation means that Great Britain and the United States henceforth are not to compete in armament as potential opponents but to cooperate as friends in the reduction of it."

No Cut in the R. F. D.

PRESIDENT Hoover is interested in trying to find why the Post Office loses \$130,000,000 a year. Those who are investigating claim that a large part of this loss is due to the high costs of the R. F. D. and of the rural parcel post delivery. It is possible, therefore, that efforts at economy may lead to a big fight in Congress to raise the rates on parcel post and to cut down the mileage of R. F. D. service.

We do not want to cross any bridges before we come to them, but we want to be early on record with the statement that if the federal government really wishes to advance the interests and the happiness of the farm people of this nation, it will extend rather than limit its R. F. D. service. It is foolish to talk of farm relief and then proceed to cut out or limit those services which mean so much to rural people.

State Fair Weather

FOR several years the New York State Fair has seemed to be "out of luck" because it rained nearly every day of the week when the Fair was held early in September. Because of this, the directors finally set the date back to the last week in August, but it still rained considerably, and a lot of exhibitors also have complained because the date was too early to get ripened products for exhibit.

In order to find out whether it really does rain more in September than in the latter part of August, Dean A. R. Mann of the College of Agriculture asked Professor Wilford M. Wilson, connected with the Weather Bureau of the United States Department of Agriculture and located at Ithaca, to make a study of rainfall conditions and records for the past several years during the last weeks of August and the first weeks of September.

Professor Wilson wrote a very interesting report which, summed up, showed that judging by the records of many years it was just as likely to rain late in August as it was early in September.

This is interesting, not only as it applies to the time that the State Fair should be held, but it also shows that many of our opinions about the weather are apt to be wrong when comparing one year with another.

Counties Get Share of Income Tax

EVERY rural taxpayer should be interested in the fact that the receipts from the personal income tax moneys collected by the State in 1929 are the highest on record, making a grand total of \$81,000,000.

Half of this is retained by the State, and half apportioned on the basis of assessed valuation to the various county treasurers, and by them distributed to the cities, towns and villages within the county borders. This county distribution of the income tax is where the farmer's interest comes in, for many of the rural counties receive very much more money from the State than they pay into the State, largely because of this income tax.

It is rather strange that although there were 110,000 fewer persons paying income tax this year than there were last year, yet the total amount paid is about \$20,000,000 more. Most of this increase was due to the money made trading

on the New York Stock Exchange. Because there is not so much trading now, income taxes next year will probably be much lower.

This money returned to the counties should be of great help to local taxpayers if properly used.

Beauty Spots of the East

VISITORS to the New England States should not fail to visit the White Mountains National Forest in New Hampshire and Maine. Several excellent roads go through the preserve and as you may judge from our front cover picture, the scenery cannot be surpassed. The highest point in the White Mountains is Mt. Washington which is 6,288 feet above sea level. Mt. Washington is a part of the Presidential Range consisting of Mounts Washington, Adams, Jefferson, Monroe, and others. Dixville Notch is located in the northern part of the state near Colebrook.

Distance lends enchantment yet it is certain that no section of the country has such a variety of beautiful lakes, mountains, rivers and plains as can be found within easy travelling distance of our own homes.

Are You Going To St. Louis?

WE have just received the dairy cattle prize list for the twenty-third annual National Dairy Exposition to be held in St. Louis, October 12-19. This leads us to remind our dairymen that we are presenting all of you with an opportunity for a real vacation, and to learn what dairymen elsewhere in the country are doing and thinking about by attending this Dairy Show in a body in the AMERICAN AGRICULTURIST-New York Central excursion train.

If interested, write AMERICAN AGRICULTURIST for further particulars.

Last Old-Time Showman Gone

WE wonder how many thousands of A. A. readers have been entertained in years gone by by the famous Forepaugh circus. The last Forepaugh brother died the other day at the ripe old age of ninety-two. He and his brother, Adam, were among the best known showmen in the world and he was the first circus man to stick his head into a lion's mouth.

Eastman's Chestnut

A FRIEND of mine who has been interested in Florida real estate was just in the office telling me something about Florida conditions, and about the great crash that came following the land boom a couple of years ago. In the midst of the trouble, when banks were failing almost every day, the negroes in one of the real estate sections suddenly got it into their heads that Uncle Sam had gone busted too, and caused a run on the local post office by taking out their postal savings. At one time there was a string of negroes more than two blocks long, waiting in line to get their savings.

The joke of it was that the post office did not have enough on hand locally to meet the run, and actually had to close its doors for two or three days until funds could be brought in!

A better story was about the Florida real estate operator who died in the midst of the Florida boom and went to heaven. When he got up there, he learned that the prices of Florida land were going up higher and higher all of the time, and he was telling St. Peter and a group of angels of the great number of millions he could have made if he only could have lived and held on that land a short time longer. In the midst of his boasting, he noticed one of the angels get up in a bored sort of way and flap away.

"That's very discourteous," said the Florida man to St. Peter. "Who was that fellow who went away?"

"That," said St. Peter, "was the Indian who sold Manhattan Island for \$25!"

Is Now the Time to Set Apples?

The Outlook is Favorable With Right Soil, Varieties and Men

By A. J. HEINICKE,

New York State College of Agriculture

THOSE who are thinking about setting out an apple orchard must take a long look into the future.

Trees which are planted in the next year or two will not produce very large crops before 1940 and they will probably not come into full production until about 1950. Just what the market conditions will be ten to twenty years from now cannot, of course, be foreseen with any degree of certainty. Nevertheless, economic conditions in the fruit industry indicate that the present is a favorable time for getting new plantings established where the natural conditions are suitable. It may require an unusual amount of courage for an orchardist to plan on replacing his trees or increasing his plantings when the returns in the past few years have been more or less unsatisfactory. And undoubtedly, many will put off the time for action until a few more years when it becomes evident to most everyone that the depression is a thing of the past, and that the trend is upward.

In the meantime, during the next ten to fifteen years many old trees and many orchards on marginal land will gradually be eliminated from the picture. While there will be a fair proportion of young orchards ready to begin production each year, no serious over-planting has occurred in the recent past to disturb the balance. There will be several million more people to consume fruits in 1950 than we now have.

New York Favorable for Apples

New York State has been near the top in fruit production for generations and will undoubtedly continue to hold a prominent position in the apple industry. On the whole, the natural conditions of climate and soil which are to be found in various sections of the state are as favorable for apples as anywhere in the country. Our nearness to the large consuming markets is enjoyed by few of our competitors. The fact that our growers have experienced and survived stresses of the weather and economic conditions is an encouraging note.

The future status of the apple industry in this state and the east depends largely upon the growers meeting the demands for a high quality product and upon the adoption of the best methods of handling and grading the fruit. Adjustments to this end are being made and they will undoubtedly be more rapid in the next few years. One need not be over optimistic to foresee that in the near future eastern apple growers will produce a larger proportion of high quality fruit, put up in such a way as to command the best prices.

Be Sure Your Soil is Suitable

A fundamental question which the orchardist of the future must decide is whether or not his farm affords the particular soil and site which are suitable for such a longtime proposition as apple growing. The mistake should not be made of assuming that all the soils in a good fruit region are equally satisfactory. Unfortunately, the importance of proper depth and especially of good under drainage has been overlooked in a large number of cases in many established orchards and this is responsible in large part for the low average yields that are found even in some of the good fruit sections. A large difference in yield may be due to very minor soil variations or slight changes in the topography of the land. Where the soil conditions are obviously poor there is no particular difficulty since trees planted on such land would soon die, but unfortunately the soil conditions which may have a vital effect on fruit trees can often be detected only in years of unusual precipitation during the fall or early spring. The trees themselves may survive the poorer soil conditions, but are left in a devitalized state unsatisfactory for the

production of economic crops year in and year out.

The question of varieties cannot be given too careful consideration. Undoubtedly, there has been a trend toward higher quality in apples. Varieties which were formerly in great demand on account of their keeping characteristics and their ability to resist ordinary methods will probably be in less favor. The eastern grower has available a number of good varieties which meet the newer requirements of the market. While many of these varieties demand more care in culture and disease and insect control, it is, nevertheless, possible to produce them economically, given the proper location and a conscientious grower.

McIntosh Needs Cross Pollination

The variety McIntosh will, undoubtedly become more prominent in the future and will gradually replace some of the older sorts. While a large percentage of the younger orchards in the east are of this variety and will begin to bear in the next few years, it must be remembered that there is a large potential demand. McIntosh growers will need to pay more and more attention to developing the highest quality of which this variety is capable. Economical methods of carefully handling this fruit and putting it on the market attractively must be considered more than with ordinary sorts.

Good crops of McIntosh cannot be produced year after year unless provisions have been made for cross-pollination. Varieties that serve this purpose best should bloom at the same time. McIntosh is an early blooming sort and consequently the list of suitable varieties for cross-pollination is limited. Cortland is satisfactory to

plant along with McIntosh. Fameuse is another good companion variety, especially suited for the cooler sections such as the Champlain Valley. Greening can be used also. Delicious, Hubbardston, Twenty Ounce and Oldenburg are exceptionally good pollen producers, but could not be recommended for extensive planting. They would be suitable where a minimum number—about 1 tree in 9—are to be set.

McIntosh is very susceptible to scab and unless the grower is unusually careful, this disease will cut into his profits very heavily. While the variety has a rather wide range of soil adaptability, it does best on the lighter soil types. The highest quality and the best color are obtained in the cooler sections of the state. The fruit has a fault of dropping easily just before it is fully ripe.

The Requirements for Spies

Northern Spy is another high quality variety which should find a place in orchards that offer the particular soil requirements. The heavier soil types should be avoided and the extremely light soils are not suited. Very good drainage is absolutely necessary. Northern Spy requires cross-pollination. It blooms later in the season than most varieties. On account of this characteristic the companion varieties are few. Rome Beauty, while not a high quality variety, is well suited for pollinating Northern Spy. When other sorts bloom with the Spy we can expect good cross-pollination.

Northern Spy trees have not been planted in large numbers in the younger orchards chiefly because of its reputation of coming into bearing later than most varieties. With special practices, such as very little pruning and ringing or bending the upright

branches of the well grown tree, it would be possible to bring the trees into bearing from three to five years sooner than normal. Northern Spy has consistently commanded good prices and is a variety that will undoubtedly reward the grower who is willing to put in the extra care in spraying and handling of fruit. There is very little danger of over-supplying the market with this high quality sort.

Rhode Island Greening is one of the best apples for culinary purposes and is especially adapted to Western New York. This variety requires cross-pollination, and responds well to good cultural practices. It does especially well on the heavier soil types. Greening and McIntosh could be grown on the same soil type provided the drainage is exceptionally good. Under such conditions Greening, McIntosh and Cortland could be interplanted and the question of pollination would be cared for. Where Baldwin and Greening are interplanted in equal numbers, the set on Greening is satisfactory.

Baldwins Always Good

The variety Baldwin is still to be regarded as a standard and dependable sort, especially in Western New York where the weather conditions are frequently unfavorable for cross-pollination. Baldwin is as certain of setting fruit whenever it has a bloom as any variety we have in this state. It is a self-fertile sort, that is, it does not depend upon other varieties for pollination.

There are a number of varieties of apples of the McIntosh type which have been originated within recent years. Among these are the Early McIntosh, Milton, Lobo and Macoun. While many of these are well worthy of a trial, they cannot be recommended unreservedly for planting on a large commercial scale since we do not have the experiences over a long series of years.

Among the best filler trees is the Wealthy. The variety responds unusually well to heavy pruning and to thinning of the fruit, and if these cultural requirements are met, the trees can be kept small, thereby avoiding crowding of the permanents for a long period of years. If the grower is unwilling to do the hand thinning, he had better not plant the Wealthy since unthinned Wealthy fruits are very small in size and often inferior in quality.

Not Too Many Varieties

It will be noted that the list for planting in the young commercial apple orchards is relatively small. This list may be extended somewhat where the grower expects to have an outlet in local markets, or where he has a roadside stand. The number of varieties might well be increased by adding fall apples where these special markets are available.

While the varieties we now have are far superior in quality to many older sorts, there is still room for improvement, especially from the point of view of the grower. We can, therefore, look for a continued shift in varieties and the alert grower will be on the lookout for the newer sorts which are being originated from year to year. There will probably be some very fine varieties from the seedlings of McIntosh and of the Delicious apples. In New York State this important work of breeding new fruits is highly developed and the wise grower will keep in touch with the Fruit Testing Association which passes on the merits of these new seedlings. As soon as it is evident that a variety has distinct merits, it would be wise to set out new blocks or to top-work some of the established sorts.

In conclusion it should be emphasized that the apple grower of the future will have to meet some very wide awake competitors who are quick to take advantage of every opportunity for improving their cultural practices and their methods of marketing. Those

(Continued on Page 6)

A Landmark in Crawford County, Pennsylvania

THIS house is undoubtedly one of the oldest in this section of Pennsylvania, being constructed in the year of 1818, by Daniel Bement, who with his wife Nancy Kimball Bement, came to Centerville, Crawford County, Pennsylvania, from Southington, Connecticut, making the entire journey with an ox team.

Mr. Bement was the first tanner and currier in the Northwestern part of Pennsylvania, and carried on this business for many years. At the death of Daniel Bement, the homestead was taken over by his son, Henry Bement, who was a successful farmer all his life, and before his death he transferred the farm to his son, Webster N. Bement, who also tilled the soil nearly all his life. At his death, the farm was divided among his three sons, and at present is being operated by Cashius M. Bement & Sons, therefore the farm has been in the Bement name, at all times since its settlement one hundred and eleven years ago.

This house is built almost entirely of white oak, and pine and at present is in very good condition and occupied. Within it is a chimney five feet square, constructed entirely of very small brick, (standard at the time of its construction) and despite the fact that this chimney has been in use for more than one hundred and eleven years, at present it is in such condition that it is safe for use.

The farm has been cultivated by five generations of Bements, the first two using oxen, the third using horses, and the fourth and fifth using both horses and tractor.

More for your money

In four years the sales of Kelly-Springfield tires to the public have trebled.

There can be only one reason for such a growth as this.

That reason is that every year more people are discovering that Kelly tires give them more tire mileage and greater tire dependability—for the same money.

"Kelly dealers everywhere—there must be one in your town"

A.A.'s Western New York Farm and Home Talk

Apple Crop Forecast Drops

THE belief that the 1929 Western

By M. C. BURRITT

And apparently we must put bees in

New York apple crop will be little if any larger than in 1928 is rapidly becoming a conviction. The June-July drop has been unusually heavy in most orchards. It would seem that this is due to poor pollination, in turn probably the result of too cold weather for bees to work, or possibly direct injury to the sex organs of the flowers at blooming time. Scab too is taking heavy toll in poorly sprayed orchards. A light crop in New York again, about three-quarters of last year's yield in Virginia and a lighter Northwest crop should mean good prices.

M. C. Burritt

Perhaps some readers may be interested in the results of the pollination work by Professor McDaniels here in my orchards, about which I told when it was in process. Six hives of bees were placed in the orchards. Two of these were put at either end of a block of Northern Spys in which we have had so much trouble to get a crop. The other four were located under a row of Romes about twenty-five rods from the Spys, the idea being that the bees must first get the pollen from the pollinating variety to carry it to the Spys. I understand other arrangements were made in other orchards.

Results of Pollination Experiments

There was practically no result in the Spys from the bees placed in the row of Romes, so far as can be seen. The two Spy trees at either end of the Spy block, under which the two hives of bees were placed, set good crops. Trees in the next rows set fairly well on the side next the bee trees, but not on the other side. In no case can the work of the bees be traced for more than thirty feet. This was probably due to the very low temperatures at blossom time for that season of the year. The recording thermometer showed temperatures of from 30 degrees to 36 degrees Fahr. at 6 a. m. and from 45 degrees to 65 degrees in the late afternoon. Only for an hour or two around noon were temperatures from 62 degrees to 75 degrees. On one day is reached 80 degrees. During most of the forenoon and the later part of the afternoon there would be only a few bees out close around the hives. From about 12 noon to 2 P. M. there would be many more out and they would go farther from the hives, though only a tree or two away.

Results of Pollination Experiments

Bouquets of bloom of Wealthy, Delicious and Rome, cut four or five feet long and set in pails of water on the ground, show an equally good influence on the set, but not even for as much distance as the bees—usually about one-quarter of the tree, and much the best on the lower limbs where the branches actually came in contact. Hand pollination with the three pollinators just mentioned gave almost perfect sets.

It is clear to me that the failure of the Spys to set fruit is almost wholly a question of pollination. For good annual pollination three things are required. (1) pollen of a fertile annual blooming variety (2) bees to distribute the pollen (3) temperatures high enough—65 degrees up—for the bees to work. We can supply two of these factors, the last we cannot influence. So we are grafting Romes into the tops of the Spys, so that every tree will be next to one with a Rome top.

the orchard either by renting or owning swarms.

About the time these notes are read the big trek of New York growers to Virginia will be on. The final plans call for arrival at State College, Pennsylvania, on Monday night, August 5. Tuesday will be spent at State College and in Southern Pennsylvania orchards. That night growers will stay at Martinsburg, West Virginia. Wednesday will see us in West Virginia and Virginia orchards on the famous Apple Pie Ridge with the night spent in Winchester. On Thursday we start southward up the Shenandoah Valley, staying Thursday night at Harrisonburg, Va. Turning eastward across the Blue Ridge on Friday we will see the Piedmont section near Crozet and stay the final night at Charlottesville, the home of Jefferson and of the University of Virginia. Advance agents have already been over the route, carefully planned the stops and arranged for the accommodations. The present outlook is that 250 to 300 growers will make the trip whose purpose is a study of the orchard industry of this great competitive region, to judge of its future and to observe its practices, all with a view to our own progress and improvement.

The dry spell, broken in places by thunder showers still holds us in its grip in this locality. It has been wonderful hay weather, but hard on growing crop. Spring grain will be very poor. Cabbage and beans need rains badly. Wheat harvest will begin in earnest this week.—Hilton, N. Y., July 21, 1929.

Setting Apple Orchards

(Continued from Page 5)

who are not capable of adjusting themselves to changing conditions and who cannot produce the crops economically will surely fall by the wayside. Given the proper man, it is safe to say that the time for setting out an orchard of best varieties on good soil conditions is probably more favorable now than it will be in five or ten years from the present. The Empire State in which the fruit industry has occupied so important a place cannot afford to lag behind and allow some other section to capture the markets.

FARM
MECHANIC

My Saw Filing Bench

(By WALTER SCHOLZ)

I HAVE used for a number of years this saw clamp and find it to be the handiest device I ever saw for filing carpenter saws. The bench is made of one two by eight, two feet long for the seat, two one by six, eighteen inches

long for the rear legs, one two by four, three feet, eight inches long for the fore leg. To the upper part I fastened a saw clamp. With this bench the clamp holds the saw where I can see just what I am doing.

This is not expensive and anybody with any mechanical skill can make it. Every farmer can learn to file his own saws and save time as well as money.

Why Spark Plugs Need to Be Changed

GASOLINE has several elements including sulphur that cause plugs to wear away, and when sulphur is present in an excessive amount, it will hasten deterioration of plug electrodes as well as valves. When the electrode wire is eroded through the action of sulphur, the old system of cleaning with emery cloth or a scraper, is of no avail.

Another source of deterioration is the iron content in the gasoline which, in time, leaves a brown coating over the insulator. This coating under certain conditions is a good electrical conductor and causes missing of the engine because the spark current travels through the coating instead of jumping the gap. This brown coating cannot be cleaned off the insulator by any available means the car owner has on hand, and when it is a very dark brown, the best thing to do is change plugs.

Carbon is still another trouble. It can be cleaned from the insulator by running the car a few miles at high speed to heat the insulators to a point where they will burn away the oil and carbon which has accumulated from slow driving. If this does not correct the trouble the best thing to do is change plugs.

Five Horse Motor for Belt Power

"Will a portable five-horsepower motor take care of silo filling, wood sawing and feed grinding, or should smaller motors be used?"

THE five-horsepower motor is about the minimum size for silo filling. A five-horsepower motor driving an 11 to 13-inch throat blower and cutter at about 400 revolutions per minute will cut and elevate eight tons of ensilage per hour into a 30 to 35-foot silo. Wood sawing in heavy hard wood with a saw none too sharp might make an average load of five-horsepower on the motor, but in general less power than that is taken. The same is true of feed grind-

ing as there are many sizes and kinds of grinders. However, there is very little objection to using a five-horsepower motor on loads of two, three or four-horsepower since the motor takes electric energy through the meter practically in proportion to the work it is doing.—R. H. Rogers.

Twenty-Six Days' Work Saved

NEW York farmers using farm electric light plants saved 26 days of manual labor per year by the use of this labor-saving convenience. Operation of milking machines, farm shop motor, cream separator, churns and similar tools and machines is cheaply done by the electricity from these plants. Less tangible from a money making and labor-saving angle but even more important from the standpoint of comfort and convenience are

the electric lights in the home, barn and other farm buildings. Many use electric lights to stimulate egg production in their poultry flocks.

Small Motor Big Enough to Handle Some Machines

ELECTRIC motors of one-quarter to one-half horsepower are capable of running any hand-turned farm machine.

Cream separators require a one-quarter horsepower motor, loose belted and equipped with an idler so that the belt slips when starting the machine. Observation has shown that constant and correct separator speed results in a higher cream yield and that two thousand pounds of milk can be separated with one kilowatt hour of electricity. Special cream separator motors are manufactured.

Fruit graders, and grain and seed cleaners also are run by one-quarter

horsepower motors. The motor should preferably be fastened to the floor or ceiling rather than directly on the machine. One kilowatt hour will grade 100 bushels of apples or clean and grade from 50 to 100 bushels of grain.

Root cutters and food and meat choppers used for livestock are often run by one-half horsepower motors, at slight power costs. A one-quarter horsepower motor mounted so as to operate a cow clipper saves long hours of cranking and speeds the work.

Emery wheels and grindstones adapt themselves very well to motor drive, and one-quarter horsepower motors are large enough for them. A 4-foot plank with the motor bolted on one end and the grinder on the other makes a fine portable grinder for use around the home.

Never turn electricity on or off when you are standing on a wet or even on a damp floor.

To Silo Owners Only

YOU are an aggressive, up-to-date farmer or you wouldn't own a Silo. You are, therefore, an intelligent buyer. You have to be. Your equipment runs into thousands of dollars.

As purchasing agent, your job is not confined to buying machinery. You have to keep posted on methods, improvements and costs. You want the cold, hard facts—not manufacturers' claims.

The 1929 Papec Cutter Catalog covers filling costs with figures—improvements—electric silo filling—Papec operation and construction with careful specifications. An honest attempt has been made to give a busy farmer the information he wants in the simplest possible form.

The new Cutter Catalog will be of interest to you whether you do your own filling or hire it done. We will gladly send it to you free of charge.

New York and Philadelphia Cream Sources

EDITOR'S NOTE—
The work reported here is part of a study of the New

York milk supply which is being made by the New York State College of Agriculture in cooperation with the New York Central Railroad.

By H. A. ROSS,
New York State College of Agriculture

CREAM sold in New York City must be produced on approved farms under the inspection and sanitary control

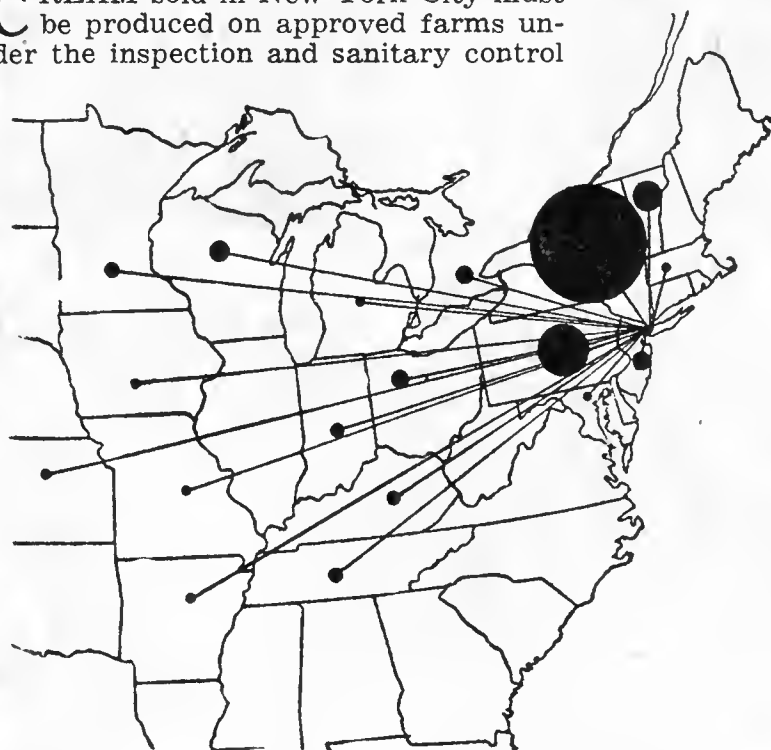

Figure 1—93 per cent of New York City's cream supply during the first 6 months of 1929 came from the New York milk shed where dairies are under the strict supervision of the New York City Department of Health.

of the Department of Health. Approval of dairies is now restricted to the territory east of Ohio because of the obvious impossibility of close supervision of all farms which are shipping cream to eastern markets. Cream from uninspected sources is now coming from as far west as Kansas, Oklahoma and Texas (figures 1 and 2).

During the first six months of 1929, western cream reaching the New York Metropolitan market outside of New York City amounted to only 7 per cent of the total supply (table 1). Ninety-three per cent came from the regularly established milk shed where plants and dairies are under the

strict supervision of the Department of Health. Only 7 per cent of the supply came from unapproved mid-western sources, and sale of this uninspected cream was prohibited in the city proper. On the other hand, the Philadelphia Metropolitan market during the same period, obtained 71 per cent of its cream from mid-western sources. Only 29 per cent of the Philadelphia market's cream supply came from eastern states. Altogether, twenty-one states sent cream to this market. Such a wide-spread milk shed would, of course, be impossible under New York City's system of sanitary control.—H. R. ROSS.

Ice Melts Too Rapidly

Why does my ice house lose its ice so rapidly or waste away so badly. It is a building, double boarded six inch spacing with six inches of sawdust between the inside boards and ice, ten feet long and twelve feet wide and twelve feet high. I

have good ice and am careful how it is packed and it is cut square. I put in from eight to ten tiers of ice and do not have

Figure 2—71 per cent of Philadelphia's cream during the first six months of 1929 came from mid-western states.

enough to run through the summer and I am sparing of it too. Of course the tiers depend on thickness. This year I have ten tiers of nine inch ice which seems ample enough for a twelve-cow dairy. I do not use any for the house refrigerator.—S.C.G., Pennsylvania.

THE length of time that ice will keep depends on a number of factors and not knowing exactly what condition your house is in we are unable to tell which one will apply.

In the first place a good drainage is necessary to take care of the melted ice and in the second place good ventilation is required to keep the sawdust or other insulating material dry. Wet sawdust conducts heat much more rapidly than when it is dry.

The only other possible reason for its rapid melting so far as we can determine is that you are not using enough insulating material.

Since minerals are more readily assimilated when the animals have free access to sunshine and are eating succulent food, the use of mineral supplements to the diet is urged when the herd is on pasture.

Magnetic Force

Helps to Operate Signals and Milk Cows

MAGNETIC force, which is used to control the pulsations in the new De Laval Magnetic Milker, is also being harnessed for many other uses. The control of railway signals to insure the safe operation of trains, by magnetic force, is only one of many such uses.

In the De Laval Magnetic Milker the use of magnetic force provides the most dependable, most effective and uniform pulsation control ever devised. In addition the De Laval Magnetic has 14 other exclusive features, making it the world's best milker.

A De Laval Magnetic will milk cows better, save you more time, give every dairyman more profit and satisfaction than anything he can buy.

Also the new De Laval Utility Milker for the low price field.

Cows "Hike" to Dairy Show

Ayrshires to Show Stamina of Purebreds

THE following interesting story of the Ayrshire cows that will walk from Vermont to St. Louis to attend the Dairy Show is a reminder that dairymen of the East can attend the Dairy Show without walking.

In order to give our dairymen a vacation and a chance to study western dairy conditions, AMERICAN AGRICULTURIST is organizing a special Dairy Show train. There will be an excursion rate of fare and a half, and expenses while attending the Show will be kept at a minimum, and lower than usual because it will be possible to get reduced rates for the large crowd. There will be something doing even going and coming on the train in the way of an interesting program, and anyone who joins the excursion will have no worry over any of the details, which will all be taken care of by representatives of AMERICAN AGRICULTURIST and the New York Central Railroad.

The National Dairy Show is the outstanding event in dairy circles in America of the entire year. Our dairymen certainly need a vacation and we hope that a large number will plan to attend. Further details may be obtained by addressing AMERICAN AGRICULTURIST, 461 Fourth Avenue, New York City.

* * *

Twelve Hundred Miles On Foot

WALKING every step of the way from their homes in Vermont, "Tomboy" and "Alice", two pure bred Ayrshire cows, are now passing through New York State enroute to the National Dairy Show at St. Louis, Missouri, where they will be placed on exhibition. Although it is necessary for these two cows to travel over 1200 miles in order to reach their destination, officials of the National Ayrshire Breeders' Association, with offices at Brandon, Vermont, and sponsors of the hiking cows, are confident that they will successfully make the trip.

This "milky derby" was planned to demonstrate that the modern pure bred cow has just as much stamina and endurance as the old-fashioned cattle that accompanied the early settlers on their long over-land trips into the western states. Furthermore, after completing the first 200 miles of her long trek the modern cow has proven that she is an efficient producer while enroute. "Tomboy", the smaller of the animals, has milked as high as 50 pounds of four per cent milk per day, and is now turning out 46 pounds. "Alice" has made over 10,000 pounds of milk since last October when she freshened and is now producing about three gallons daily.

A Barn On Wheels

Accompanying the cattle is a very attractive "barn", mounted on a truck chassis, which serves as headquarters for the attendants and as a base of supplies for the animals. One pound of balanced ration is fed for every four

pounds of milk that is produced by these cows on their journey. No beet-pulp, corn-silage or hay is carried. The cows are allowed to graze at night and also secure some roadside grass while travelling.

"Tomboy" was bred and owned by L. B. Chapman who maintains a herd of 200 Ayrshires, on a mountainous farm near West Rutland, Vermont. She is somewhat undersized, and before leaving home had never been fed over six pounds of grain per day, nor ever enjoyed any legume hay or clover pasture. "Alice" was bred and is owned by the Vermont Industrial School at Vergennes, Vermont. A sister to the mother of the latter is the highest record cow in Vermont. Alice and Tomboy are attractive specimens of the Ayrshire breed; red and white in color, and according to cattle experts, very good in udder development.

In selecting the two animals for this trip no particular effort was made to get outstanding or unusual specimens. Two breeders conveniently located to the Brandon office were invited to furnish candidates, that would measure up to the average of their herds and the breed. One of the cows had only been in milk for seven weeks when the trip was started. The other had been fresh over eight months.

Boots for Sore Feet

The original plans called for a route on dirt roads and the minimum use of hard surfaced roads. However, experience has demonstrated that the main paved roads seem most satisfactory, and as a result the touring Ayrshires have followed the Cherry Valley Turnpike and will follow other main roads. Leather boots have been provided for emergencies that might arise due to rough roads or sore feet, but there has not yet been any occasion to use them.

A minimum of ten miles per day is being made, with occasional journeys of thirteen and fourteen miles per day. It is planned to walk the cows every day, except during a week's stop at the Ohio State Fair. Milk weights are being kept and regular Advanced Registry supervision made while the cattle are traveling.

Lice On Calves and Cows

Will you kindly send me a rule for killing lice on calves and cows?—L.A.M., New York.

PROBABLY the chief cause of failure in controlling lice is the failure to follow-up the first treatment with a second treatment in about two weeks to kill the lice which hatch out after the first application of powder.

Many dairymen report excellent results from the use of ground sabadilla seed. Another treatment recommended is to brush crude oil thoroughly into the animal's hair. There are also a number of good commercial lice powders on the market which can be used with excellent results.

*a neighbor
a citizen
a friend*

...your DEALER

ONE of the most important men in your community is the feed dealer. On his integrity and intelligence depends the prosperity of the neighboring poultry and cattle raisers. And on their prosperity depends his own.

But it is not selfish interest alone that makes him so thoroughly alive to serving your needs. There is also the interest of a neighbor... a friend. He votes at the polls with you, his children go to school with your children, your problems are his.

So it is not only his responsibility, but to his personal interest, to see that you get the best feeds he can procure. All his judgment and experience enter into the selection of his stock. He supplies only feeds that he knows have been thoroughly tested—every ingredient chemically analyzed for purity, each final mixture proven for production on actual herds and flocks.

His advice and counsel on feeding problems and management are worth seeking, because he is in touch with the latest developments, inside and outside of his own community.

Trust in the sign of your feed dealer—he has a stake in the land and a position to uphold.

Reviewing the Latest Eastern Markets

Milk

The following are the August prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond.		
Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Market Higher

CREAMERY	July 25, 1929	July 19, 1929	Last Year
HIGHER THAN EXTRA	44 -44 1/2	43 -43 1/2	45 -45 1/2
Extra (92c)	-43 1/2	42 1/2	44 1/2
4-91 score	39 -43	38 1/2-42	42 -44
Lower G'ds.	38 -38 3/4	37 -38 1/4	40 1/2-41 1/2

The butter market on Monday, July 22 showed no material change from the previous week. The market continued at about the same level until Wednesday the 24th when the price on the better grades advanced 1/2c. On the 25th the feeling of strength in the market caused an advance of another full cent. It is rather difficult to analyze the reason for the advance at this time in face of the fact that butter in the freezers on July 23 was near seven million pounds in advance of storage stocks on the same date last year. However, some of this advance is attributed to the higher market at Chicago and to reports from western sections indicating, for the first time, a material shrinkage in production.

At the same time the lower proportion of the top grades received has created a wider spread in prices as prices on the lower grades were not advanced to the same extent. The consumptive demand has not shown any material change. It is expected that buying for storage will fall off at present price levels. Storage holdings, according to the U. S. Dept. of Agriculture, in ten cities on July 24th were 73,114,839 as compared with 65,657,599 on the same date last year.

No Change in Cheese

STATE FLATS	July 25, 1929	July 19, 1929	Last Year
Fresh Fancy	23 -25	23 1/2-25	25 -25 1/2
Fresh Av'ge			24 -
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	26 1/2-
Held Av'ge			

The market on cured State flats has been firm but rather weak on fresh State flats. There has been a little change in the market since last week's quotations. Storage holdings, as reported by the U. S. Dept. of Agriculture, on July 24, including ten cities were

17,928,759 pounds as compared with 14,982,489 pounds on the same date last year.

Eggs Move Higher

NEARBY WHITE	July 25, 1929	July 19, 1929	Last Year
Hennery			
Selected Extras	47 -50	45 -48	43 -45
Average Extras	44 -46	42 -44	41 -42
Extra Firsts	38 -42	37 -40	36 -39
Firsts	35 -37	33 1/2-35	33 -35
Undergrades	33 -34	32 -33	32 -
Pullets			
Pewees	22 -29	20 -27	25 -26
NEARBY BROWNS			
Hennery	39 -46	38 -44	38 -40
Gathered	33 1/2-37 1/2	32 1/2-36 1/2	30 1/2-37

Receipts on eggs at New York have been shrinking with indications of further falling off in receipts at New York. The New York market has failed to advance on a parity with country costs. Browns have been selling well at Boston and western markets have continued to advance until prices are above the New York market. It appears that this condition has resulted from a tendency to turn to storage eggs in New York city which can be moved at a profit, rather than to pay higher prices for fresh eggs.

There has been little inclination to store at present prices. At the same time dealers are anxious to clean up each day's receipts because of the hot weather which might result in deterioration if they should be held over.

Readers who wish information on prospective production and prices during next fall and winter will find a summary of conditions on Page 18 of this issue.

Poultry

FOWLS	July 25, 1929	July 19, 1929	Last Year
Colored	-32	-33	-25
Leghorn	26-30	30-31	18-21
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	29-35	30-40	33-42
Leghorn	23-28	25-30	25-30
CAPONS			
TURKEYS	20-35	25-35	20-23
DUCKS, Nearby	20-25	20-25	10-
GEESSE			
Rabbits	13-15	16-17	15-20
	26-28		

Receipts of live poultry in New York have been rather heavy and on Thursday indications pointed to the necessity of holding over several cars, probably at least 25, until next week. There were a good many broilers arriving during the week and it was necessary to shade prices on small broilers considerably below quotations in order to market them. Hot weather has affected demand and has resulted in the weakening of the entire market.

On July 25, a few fancy Rock broilers arrived by express and brought 37c to 38c, but by noon the swing was largely in the buyers' favor. On July 24 nearly 7,700 Long Island ducks arrived and worked out fairly well.

Pigeons and squabs have been rather weak and rabbits have been scarce and the market continued firm.

Potatoes Up a Little

On July 25 Virginia and Maryland potatoes again reached \$5, although some receipts of inferior quality were not cleaned up. Long Islands were quoted at \$5 and \$5.25 per bbl. for the best, although the trade in Long Islands was a little slower and the market was sustained with difficulty.

Jerseys are quoted at \$4 and \$4.50 for No. 1's in 150 pound sacks.

Late reports from New Jersey indicate that production is very light and that it will not reach, even the latest Government crop estimates. The dry weather is given as a cause for this. Reports from Long Island and upstate New York also indicate that dry weather may seriously affect production. In fact, about the only section where the crop is reported to be up to normal is in Maine. All indications at present are that prices will be high although, of course, exceptionally favorable weather may to some extent affect production in the late producing states.

Hay

There is a surplus of low grade hay on the market making it almost unsaleable. Good timothy in large bales

is steady and in demand. No. 2 timothy in large bales on July 25 was quoted at \$24 to \$25 and \$21 to \$23 for small bales. Rye straw was quoted at \$21 to \$22.

Feeds and Grains

FUTURES	July 26, 1929	July 19, 1929	Last Year

34% O. P. Linseed Meal	56.00	55.50	50.50

The above quotations, taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Crop reports from the spring wheat country of the Canadian Northwest are being reduced steadily. Owing to the continued dry and hot weather losses from premature ripening are making the outlook distinctly unfavorable. Speculators are gambling on continued unfavorable weather and are disposed to buy heavily. At the present time wheat is approximately 40c higher than it was about a month ago.

Corn prices are also on the upward trend due to dry weather and in sympathy with wheat prices.

Reports indicate that the oat crop of the Northwest will not be heavy. On July 26 there was an advance on this commodity from 1 1/4c to 1 1/2c.

Fruits and Vegetables

Summer varieties of apples are coming into the market from New Jersey and other southern points. Duchess on July 25 reached \$2 to \$2.50 for good to fancy while Wealthies and Williams Reds brought \$2 to \$2.20. Mixed varieties are quoted at \$3 per basket.

The market on peaches is rather dull and weak and prices averaged 25 cents lower on July 25. Greensboro from New Jersey were reported from 50c to \$1.50 per bushel basket.

Blackberries from New Jersey on July 25 brought 18c to 25c per quart. Other varieties ranged from 15c to 23c. Receipts from the Hudson River section brought 25c to 32c.

New Jersey huckleberries were reported at 30c to 35c for wild varieties and 40c to 75c for cultivated fruit. Huckleberries from the Hudson River Valley are quoted at 18c to 19c per pint.

Cauliflower from New York on July 25 was quoted at \$1.75 to \$2.50 per crate.

Cabbage from New Jersey brought \$1.25 to \$1.50 per basket. Nearby white brought \$2 to \$2.25 per bbl. and nearby red brought \$3 per bbl.

New Jersey Rutabagas brought from \$2.50 to \$3 per bbl. and \$2.25 to \$2.50 per bag.

Fancy tomatoes from New Jersey are quoted at \$1.50 to \$2.75 for fancies in 20 quart baskets and 60c to \$1.25 for best in baskets.

Blueprints for Potatoes

(Reprinted from a recent issue of the New York Sun.)

Long, thin sweet potatoes and short, chunky ones may be equally palatable but they do not have the same commercial value. New Jersey farmers, who grow more than \$3,000,000 worth of sweet potatoes every year and know that Eastern consumers want the short, chunky ones, asked the State Agricultural Experiment Station to show them how to produce crops of the desired size and shape. Field experiments under the direction of Prof. L. G. Schermerhorn have proved that the chunky variety of sweet potato will grow only in soil to which a fertilizer rich in potassium in relation to nitrogen has been

applied. The potato growers of New Jersey now have available a formula for fertilizer drawn up by Prof. Schermerhorn on the basis of his experiment over a course of five years.

Dr. W. R. Robbins of the experiment station carried the work forward in greenhouse experiments and found that short, chunky potatoes have a high percentage of protein, and long, thin ones a high percentage of carbohydrates. Dr. Schermerhorn discovered that the ideal commercial sweet potato should be four and a half inches long and two and a half inches thick. Between them the two experimenters have been able to give New Jersey farmers complete instructions for growing sweet potatoes to specifications.

Trend of the Farm Markets

Special to American Agriculturist from
reau of Agricultural Economics,
reau of Agricultural Economics,
U. S. Dept. of Agriculture.

Supplies of butter, eggs and green produce have continued heavy for the season, but the midsummer markets have acted as well as could be expected. Nothing of the kind has declined far. Potatoes have not gone back much from the high points of mid-July. Live stock, dairy and poultry products find unsettled markets, but without much change in price. Hogs sell higher. Wool markets are acting a little better. Grain and feeds round out their sharp gains, greatly improving the general conditions in producing sections. On the whole, July is likely to be regarded as having been a market month favorable to many lines of farming.

With the sudden decrease in shipments of new potatoes the recovery of prices after mid-July was not unexpected. On a 100-pound basis, sacked New Jersey stock sold in New York City at \$2.65 and arrivals from Long Island at \$3 to \$3.25. The Chicago carlot market was lower on Kansas and Missouri Cobblers at \$1.90 to \$2.

Central California cantaloupes are running to large sizes. A fair movement of cucumbers from Eastern Shore of Maryland and Virginia is expected to last up to about Aug. 10. The quality is improving.

Georgia's daily peach output decreases as the season nears an end in that state. The season is well under way in Maryland, Virginia, Delaware, Tennessee and Washington. Fair quality, small to medium sized New Jersey peaches could be had as low as 75 cents to \$1.25 per six-basket crate in New York.

The July surplus of 22,161,000 pounds of butter was considerably larger than anticipated by most of the trade. It is generally believed that the markets are still increasing their holdings. The make of butter is holding up remarkably well. Few look for any farther advance in price of cheese at present, owing to favorable condition for production and to increase of holdings.

Fresh killed roasting chickens have sold promptly. Fowls have been in light supply and with strong western advices, prices showed further advance, especially on small sizes.

Most dealers have been reluctant to store July eggs and have been free sellers, but recently there has been more interest, and both spot and future prices have worked a little higher. The trend of egg prices seems to be upward.

The grain market developed a decidedly stronger tone after the middle of July and prices advanced sharply. The marked deterioration in the Canadian wheat crop during the month was confirmed by official and trade reports. Rye also advanced with wheat, despite the slower demand for that grain.

At Chicago, strictly grain fed steers maintained their recent strength and have sold slightly higher the last half of the month. Light yearlings were in more active demand.

After nearly two weeks of consistent price gains in the Chicago hog market, and a sharp setback after the middle of the month, the net results showed gains, moderate but larger than for the other lines of live stock. Underlying position is still considered strong. The top prices still are well above \$12. Shipping demand was light and small packers took smaller droves than usual on account of the unsatisfactory fresh pork market.

The lamb market shows little net change. The week's top on range lambs was \$15.25, with natives at \$15.50, the bulk of sales ranging from \$15 to \$15.25 on rangers and \$14.50 to \$14.85 on natives.

A firmer tendency was noticeable in the Boston wool market. Several concerns are holding firm at advanced asking prices, although no sales have been reported at the advance. The 64s and finer quotations of fleece wools were quiet, but were steady.

Farm News from New York

Health Commissioner Suggests New Milk Marketing Plan--County Notes

A CONFERENCE which may be of vital importance to all dairymen in the New York milk shed took place in the office of Dr. Shirley W. Wynn, Health Commissioner of New York city, on July 25, when the Commissioner outlined to representatives of the milk dealers and the dairy cooperatives a new plan for stabilizing milk prices and production in this territory.

Dr. Wynn's suggested plan for better milk marketing conditions contained several features, the first of which was a suggested change from the present classified plan of selling milk. The Commissioner said that it was unfair to farmers not to know until a month or more after they had delivered their milk what they were going to receive for it. He stated also that there was not much hope in asking milk producers to increase their supply for next fall when those producers have no idea what they are going to get for their milk. The Commissioner believes, also, that fall prices to farmers are not high enough as compared with the June prices, and that the way to get milk when it is wanted is to pay for it.

For a New Price Plan

Dr. Wynn suggested that a new price plan should be put into practice for the New York milk shed, having some of the features of the Philadelphia plan, whereby the farmer is paid for the whole year on the basis of what he produces during the short months. After allowing for some small, reasonable fluctuations, any milk produced, say in June, above what is produced in November, will be paid for at a surplus price instead of receiving the high basic price.

The Commissioner strongly emphasized the point that no new plan of this kind should be put into effect all at once, and that plenty of time should be allowed to give dairymen a chance to prepare to meet the new conditions. He thought possibly some features of a new price plan might be used this year, particularly that some indication might be given farmers as to what price they might expect next fall so that they would be encouraged to increase their production of milk when it is most needed.

Dr. Wynn said that the increased amount of young stock in the milk shed makes it evident that there will be no shortage after this year. In fact, there might be an overproduction when there would be all the more need for farmers to have a price plan that would help to stabilize production.

The Commissioner stated that if it became necessary to go outside of the milk shed this fall for supplies of cream, that his inspectors would approve some outside plants on a temporary basis, with the distinct understanding that these outside supplies would not be accepted by the Department of Health when the shortage no longer existed. He said that it was much better to give permits admitting this cream temporarily rather than have the city glutted with bootleg milk and cream coming in without inspection, permits or control.

Would Control Price Cutting Dealers

A very important factor of the Commissioner's suggested milk marketing program was his statement that the Department was going to take steps to control the unscrupulous, bootlegging, small milk dealer who is continually upsetting the market by his gambling operations. During periods of surplus, such small dealers use the increased supplies to cut prices, and during periods of shortage the same dealers bootleg supplies.

Under Dr. Wynn's new plan the Department of Health would require every milk dealer to furnish a certificate of good character, honest dealing and reasonable assets for carrying on his business. Further than this, the Department would demand that every dealer supply the Department with milk contracts showing where the dealer will get all of his supplies for the entire year. If this one step alone is carried out, it will have a tremendous effect on improving marketing conditions in the big city.

Dr. Wynn cited the daily waste of at least 40,000 quarts of milk because of the present necessity of every milk wagon carrying a few extra bottles of milk to take care of the fluctuating demand of the consumers. The Commissioner said that he hopes to be able to grant permits to dealers which would enable them to repasteurize this milk when it was returned from the wagon and there-

by save it. He stated that this saving to dealers should enable them to pay some increased price to the farmer.

The dealers' representatives were asked to think over the Commissioner's suggestions and to return for another conference on a date set tentatively for August 6.

At the beginning of the conference, Dr. Wynn said that he had just talked with Governor Roosevelt, who was intensely interested in preserving the milk market for New York dairymen, and at the next conference on August 6, Henry Morgenthau, Jr., publisher of AMERICAN AGRICULTURIST, and chairman of Governor Roosevelt's Agricultural Advisory Commission would represent the Governor.

Lamb Crop Slightly Smaller

THE United States lamb crop is about 1 per cent smaller than the crop of 1928, but over 7 per cent larger than the 1927 crop. This decrease was brought about principally in western lamb states as many eastern states showed an increase over last year's crop. In New York State, the indications are for 308,000 lambs as compared with 362,000 in 1928, while Pennsylvania shows an increase, the 1929 figures being 272,000 as compared with 259,000 in 1928.

Potato Growers Will Tour Western New York

THE New York Cooperative Seed Potato Assoc. with its main office at Utica, New York is inviting its friends and patrons to attend its Annual Blue Tag Potato Tour on August 12-13th. During these two days the largest and most progressive of the Certified seed growers in Steuben, Livingston, Allegany and Wyoming counties will be visited. At each farm the owner will be interviewed regarding his cultural practices and seed selection methods and the Certified seed growing in the fields will be inspected. The tour will start from Bath, New York, Monday morning at 8:30 and disband at Gainesville, Tuesday afternoon. Monday night at Dansville a potato Banquet will be held.

At the various stops along the route talks will be given by scientific men and by practical farmers of long experience and state-wide reputation. During these two days new beginners in the Certified seed business can secure information that it has taken the older growers years to gain.

The Steuben County Farm Bureau, is

New York County Notes

Tioga County—On account of so much traffic on the highway between Binghamton and Owego (which is said to be the most on any highway hereabouts) resolutions are being passed by several clubs and societies to have the Owego-Campville-Endicott Highway constructed as soon as possible. This road will relieve the congestion.

The Chamber of Commerce of Owego has purchased a chemical truck and formed an association to be known as the "Rural Fire Protective Association" to respond to fires outside the village. It will be housed at the Central fire station and will be manned by experienced firemen, members of the newly formed society, which is really a volunteer fire company of 55 members. This will indeed be a boon to rural communities as villages do not think it advisable to have their regular fire apparatus away from the village, fearing they may be needed at home.

The old saying failed this time sure as St. Swithin's Day was fair and there was a terrific thunder and electrical storm on the 18th for hours. Haying is catchy as rains are so frequent. All vegetation has grown rapidly, just sprung up amazingly. Corn looks fine, as do all crops, though the potato yield is pronounced lighter than usual.

Fruits are not a regular yield. Currants and cherries are high in price, 25c and more a quart. Berries are 35c. Potatoes are around 60c or more a peck. Apple and pear crops are poor and peaches are below last year. It is now stated that natural gas may flow through the old pipe lines of Standard Oil Co. from Olean to New York.

The State orders Waverly to construct a \$300,000 sewer system in the near future. It is badly needed.

The Orange County Circuit is attracting much attention from horse lovers. It will be held in Owego on July 30-31 and August 1. This will be the third meet here. Dickerson, the noted trainer, is pleased

cooperating toward the success of this tour by combining their Annual Tour with it. Several other counties are contemplating the same action. Everything indicates that August 12th and 13th will bring together the largest crowd of interested potato men that has ever inspected Certified fields in upstate New York.

Wheat Prices Up and Down

ALTHOUGH eastern farmers grow a relatively small amount of wheat, the majority of them are interested in wheat prices due to the fact that they buy large quantities of wheat by-products for feeding dairy cattle and other live stock. On July 23, wheat took a jump of 7c at Chicago, bringing July wheat up to \$1.41½. On the next day, however, there was a decline of 2½ to 2½ cents and July wheat closed at \$1.38½.

The principal reason given for the advance in wheat prices since the low point several weeks ago when wheat went below one dollar a bushel, is a downward revision in the government and other crop reports. There seems to be a general belief that the final crop for North America will not be over one billion bushels as compared with 1,200,000,000 bushels estimated about a month ago. At the same time, the United States Crop Reporting Board estimated stores of wheat in America on July 1, as 40,136,000 bushels as compared with 19,277,000 bushels on July 1 last year.

There has also been a strengthening of corn prices caused in part by the rising wheat and partially by reports that dry weather in the corn belt has given the crop a setback.

Plan for Interesting Programs At State Fair

PLANS are under way for an interesting program during the entire week at the State Agricultural Museum.

There will be exhibited in the museum several hundred old farm implements and household utensils which have never been on exhibition. There will be demonstrations of spinning, weaving, cooperage, shoemaking, shingle shaving and clay moulding. The oldtime fiddler will be there. There will be short addresses by prominent men and women and community singing, daily.

A singing contest, with singers in old-time costumes, will be conducted Tuesday, Wednesday, Thursday and Friday.

with the track. "Peter Manning" the world's fastest pacer, is here for an exhibition mile.—Mrs. C.A.A.B.

Columbia County—This has been a week of nice hay weather except for one rainy day. The convention of County Legion is to be held at Chatham, July 29th. The Philmont Boy Scouts had a Camp Fire meeting. A forest fire in Ellenville was put out before much damage was done. The Hudson Lane Construction Co. of Meriden, Conn., has the contract for the Columbiaville-Stuyvesant Highway. The Poultrymen's Club attended a culling demonstration in the county and had a picnic at Twin Lakes, Elizaville. Eggs 33c a dozen, chickens, live weight, 42c a lb., huckleberries, 30c a qt., butter 45c a lb.—Mrs. C.V.H.

Dutchess County—Everything has been drying up, but we had a good rain last night. Apples will be a light crop. The Farm Bureau Meets at Upton Lake August 8th, when Governor Roosevelt will speak. Potatoes 55c 15 lbs., eggs 45c, corn late, potatoes light crop, oats poor, hay fair. Hens bring 30 to 35c, live weight, broilers 40c. Nights are cold. Many farms are being sold at high prices. The largest freighter in the world is in Poughkeepsie, 527 feet long, 68 feet wide, 42 feet deep, holding 3,500,000 feet of lumber.—P. S.

Suffolk County—The annual meeting of Farm Bureau Committeemen was held at the L. I. Vegetable Research Farm near Riverhead, July 20th. About one hundred men and their families were present. Speakers were Dr. U. P. Hedrick, Director of the Geneva Experiment Station and Dr. H. C. Thompson, head of the Vegetable Gardening Department at Cornell. Farmers are feeling more optimistic since heavy showers broke the long dry spell. There is a great rush to get cauliflower set out. Potato digging has started; early price \$1.70 per bushel. All local organizations are having annual picnics at the beaches.—G.H.

Liberal prizes and terms have been made. For further information, write Mr. C. H. Baldwin, Department of Agriculture and Markets, Albany, N. Y.

Cooking of old-time dishes, in a Dutch oven in connection with a fireplace in the museum, will be demonstrated by experts in charge of Miss Martha Van Rensselaer, Dean of the Home Economics College, Cornell University.

Two bronze tablets will be unveiled in

Agricultural Programs From WGY

12:00 Noon—Eastern Standard Time, daily except Saturday and Sunday—weather report, farm produce report, farm talks. Readings from the poets of the farm and home by E. R. Eastman.

5:10 P. M.—Eastern Standard Time, daily except Saturday and Sunday—farm produce report.

7:00 P. M.—Eastern Standard Time, (8:00 P. M. Daylight Saving Time). Thursday—Half-hour agricultural program.

the museum at two P. M., Thursday, August 29th. Mr. John B. Howe, Editor of the Syracuse Herald, and Governor Franklin D. Roosevelt will be the principal speakers; Commissioner Berne A. Pycke presiding.

The officers of the State Agricultural Society plan to make the State Agricultural Museum one of the greatest attractions for instruction and entertainment at the state fair.

Federal Farm Board Meets Daily

THE announcement of the Federal Farm Board during its third day of work to the effect that it will deal only with officials of the cooperatives themselves in the matter of applications for loans, and that no association need employ counsel or other special representatives, is considered particularly significant.

This is largely a warning to slick lawyers not to try to collect big fees from the cooperatives for the service of getting loans from the board, but it also carries much broader significance. It is true, of course, that at least two members of the board—Messrs. Stone and Williams—have vivid recollections of what happened when the War Finance Corporation under Eugene Meyer started making loans to cooperatives back in 1922. They saw cases where cooperatives had difficulty in getting loans until they employed the "right" attorneys to intercede for them. Criminal prosecutions were threatened in this connection but were never pressed and the full facts never became known. But enough is known to warn against taking any chances on similar occurrences in handling the present board's loan funds.

Another statement given circulation by the board needs explanation and analysis. A widely quoted statement of the chairman of the board says that about 2,000,000 of the 6,000,000 farmers in the United States are in cooperative organizations of one kind or another. This gives the impression that farmers are already one-third organized. This is far from the facts.

It is true that about one-third of the total number of farmers belong to some sort of cooperative organization. But this may be only a local fertilizer and feed buying association, or it may be any one of the local associations handling some one of the several crops the farmer grows. If a farmer belongs to a livestock shipping association he would be counted in as one of the 2,000,000. But this membership would be of no help to him in marketing his wheat, corn, fruits, poultry or other products.

Mrs. Sargent To Speak At Fair

MRS. Abbie C. Sargent of New Hampshire, Chairman of the Home and Community Dept. of the Eastern States District of American Farm Bureau Federation, is to be the woman speaker on Farm and Home Day at New York State Fair at Syracuse. This will be Tuesday, August 27th.

WHEN BUYING DIP

buy EMULSION AND STRENGTH

DR. HESS Dip and Disinfectant makes a perfect milk-white emulsion. No streaks, settlings, or raw, undiluted oil on top. The germ and insect destroying power is evenly distributed—no waste.

DR. HESS DIP and DISINFECTANT

5 times as strong as carbolic acid

It has a carbolic acid coefficient of 5. That denotes its superior strength.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks and other animal parasites—combats disease germs.

Use it in pens and stables and about the home—wherever there is filth, foul odors and disease germs.

With the A. A. Livestock Man

Silage for Ewes

I have 45 ewes and I am feeding them mixed hay and 2½ bushels of ensilage a day. It is nearly time for them to have lambs. Will the ensilage have any bad effect on the lambs? I have had some trouble other years by lambs getting stiff. I have barley and oats to feed. What other ground grain would be good to mix with it? I have to buy some grain. What is ensilage worth per ton with not many ears on it?—F. S. B., New York.

GOOD sweet silage is a valuable supplementary sheep feed both for its feed value and for the succulence it supplies to the ewes during the winter when such feed is so valuable in keeping the ewes in good thrift. More silage can be fed safely after lambing than just before—unfortunately the feeding of silage to ewes just before they lamb has a somewhat spotted reputation—due no doubt to the condition of the silage. There is a feeling among the best sheepmen that sweet silage made from mature corn with no mold is a very safe sheep feed both before and after lambing. Hay is so cheap at present and grass is so near that silage could not be expected to bring a very large price at this time. Local conditions would have more to do with its value to a man than anything else. I would suggest that you buy wheat bran to mix with your barley and oats.

When lambs are from six to ten days of age they sometimes become stiff—have rheumatism or whatever one may wish to call it—the condition apparently caused by too rich milk. After the ewes are out to pasture the trouble seems to be reduced. We find this among the good feeders—salt kept before the ewes and lambs at all times, I believe is helpful—also the mixing of Epsom salts or Glaubers salts with the ordinary salt. Here is where the tonics help—if anytime. After the ewes lamb they ought to have no grain until it is apparent the lamb is going to take most of the milk. Some men give a ewe nothing the first day except water to drink. When

the lamb is from three to six weeks of age the milk changes composition—getting richer in fat—at that time the fastest growing lambs from the best milkers will get stiff, froth at the mouth, lie in a corner, often fail to get up and later, die. I think that if lambs have access to salt all the time this trouble is reduced. I may over-estimate its value but I believe a stock tonic is a benefit here—something is wrong with the lamb's system or it would not happen.

I have placed no money value on the silage but for me I would prefer clover hay and wheat bran to mix with the barley and oats.—Mark J. Smith.

Treating Hogs for Worms

Please advise me what to give our hogs as I think they have worms. I have been feeding them quite a few boiled red skinned potatoes. They do not grow as they should.—G. T. W.

NATURALLY we do not have any way of knowing for sure whether or not your hog has worms. We do know that intestinal parasites are fairly common and that they cause considerable loss. Much attention is being given lately to raising hogs on clean ground as this seems to lessen the damage from worms.

A treatment recommended by the New York State College of Agriculture is to get from your druggist a number of capsules which contain 3 grains of santonin and 3 grains of calomel. Open the pig's mouth and place the capsule well back on the tongue. A dash of water will insure the hog swallowing it.

Pigs which weigh less than 40 pounds should get a capsule containing 2 grains of each ingredient. Give the capsule after the pig has missed one meal and follow with a mild cathartic at the next meal. There are also a number of good commercial worm remedies on the market.

Milk Production and Dairy Products in New York, 1928

DURING 1928, an average number of 1,304,000 cows of milking age produced 5,534 pounds of milk each, or a total of 7,217,000,000 pounds of milk. Of this, approximately three-fourths was delivered at commercial dairy plants, the rest being used in farm homes, for home-made butter, for fattening veals and raising other calves, and for local sales. There has been a fairly steady increase in the production of milk per cow in recent years, the average of 5,534 pounds per cow in 1928 being about 9.3 per cent greater than the 1922 average.

The following table gives a summary of the milk and cream received at dairy plants in New York, as reported to the New York State Department of Agriculture and Markets, together with the milk, cream and other dairy products, sold or manufactured by these plants. A printed bulletin giving these figures for 1928 in greater detail, by months and counties, together with much other material of interest regarding the dairy industry, is being prepared and will be available when printing is completed.

LIVESTOCK BREEDERS

Fishkill Farms

Offer for sale a grandson of

**Dutchland Colantha
Sir Inka**

One of the greatest sires of the Holstein breed.

This young bull was born July 15, 1929. His dam is

Lady Inka Daisy Ella

At 4 years and 1 day of age this cow made a record in Class B of 17,154.4 lbs. milk and 644.75 lbs. butter in 305 days carrying a calf 202 days.

This young bull is sired by

**Fishkill Sir May
Hengerveld DeKol**

whose sire is also a grandson of the Dutchland Colantha Sir Inka, out of a 30 lb. 4 year old.

We are offering this fine young bull at \$100.00, provided he is purchased before he is 30 days old.

For pedigrees, terms of sale, etc., write

How To Make a Box Kite

AS many of our younger readers have asked us about making box kites, we are giving the following simple directions. Box kites are quite frequently used for raising recording instruments for weather observations and by using several on one string are capable of lifting considerable weight.

The sticks should be made of light, straight, grained wood, preferably spruce, basswood, or white pine. The four longitudinal sticks should be $\frac{3}{8}$ -inch square and 42-inch long, as shown in the diagram (D-715). The four diagonal struts should each be $\frac{1}{4}$ by $\frac{1}{2}$ by about 26 inches. These struts should be notched as shown and the ends wrapped with several turns of waxed end or with any small stout linen or silk thread, and also be wrapped tightly with the same thread at their intersection.

The proper material and application of the cloth bands have much to do with the success of the kite. Preferably they should be made of nainsook, lonsdale muslin, light-weight percale, or other cloth which is light and strong and which will not shrink or stretch too much after wetting and drying.

Sometimes the cloth before using is dipped into gasoline in which a very little paraffin has been dissolved to make it less subject to weather conditions. The cloth bands should each be hemmed on the edges into a band exactly 12 inches wide. The ends should be brought together and a lapped and double sewed joint made so the complete band is 74 inches long, or 37 inches when measured folded. Pencil marks should now be made across the bands $18\frac{1}{2}$ inches apart to mark where the corners of the longitudinal sticks come, using a square to be sure they are at right angles to the edges of the cloth bands. When finished, the cloth bands should be fastened to the longitudinal strips with small tacks as shown.

The diagonal struts should not be cut to exact length until the cloth bands are on, since they should be long enough to be bent just a trifle when in place, to be sure that the cloth bands will be stretched and held taut, and this will depend a little on the kind of cloth which is used. When the struts are in place, their ends should be held from slipping by small tacks on each side driven part way into the longitudinal strips. By removing some of these tacks, the struts can be slipped out and the kite rolled up into a compact bundle.

The bridle or string loop with which the kite is fastened to the holding string, should be fastened around a longitudinal stick about 8 inches from the farther end as the kite flies and about 6 inches from the nearer end. A small loop is made in the bridle, and the kite string fastened into the loop either with a square knot or a weavers knot. In a light wind the string A will be shorter than B; in a stronger wind, lengthen A and shorten B; and in a very strong wind, do not use the bridle but fasten the kite string securely to the strip at C. Other methods of attaching the bridle are sometimes used, and each boy must find out for himself what arrangement gives

SOCONY is right at home on the farm. For fifty years, Socony products have been helping the farmer make a better profit on his produce. Today Socony plays a more important part in making a successful farm than ever before. Among the products we make especially for farm work are:

Ruddy Harvester Oil
Eureka Harness Oil
Standard Hand Separator Oil
Mica Axle Grease

Socony Turex Oil
(For Diesel and Oil Engines)
Socony Disinfectant
Socony Household Oil

Socony Gasoline & Special Gasoline
Socony Parabase Motor Oil
Socony 990-A Motor Oil for
Model A Fords

If you are not already acquainted with Socony products for farm work, put them to work as farm hands today.

the best results. We should be glad to hear from our young readers as to what kind of a kite they get to operate best, with sketch and dimensions for constructing and directions for making and flying.—L. W. DICKERSON.

Too Many Comforts

THE "good old times" are largely a state of mind only, as far as actual conditions are concerned. The man who one hundred years ago believed he was living in the best age that ever had been and probably ever would be, undoubtedly lived in the best age for his own happiness.

The thing which today makes it hard to believe that we are living in the best age is the fact that so many disagreeable things have been removed that the bright spots in life do not stand out

so prominently as they did in bygone days. We cannot enjoy our Thanksgiving dinner as our ancestors did because many of the choice foods which they reserved for that day alone are now on our tables every day. In other words, food must be sufficiently scarce to taste its best. The bright crackling fire on the open hearth brought comfort and cheer to the dark cold pioneer's cabin, even though it warmed him only on one side. The contrast enabled him to realize its value. I dare say there are individuals living in our climate today who scarcely know how it feels to be cold.

Everywhere discomforts have been eliminated. My grandfather came to America in 1827. Drinking water for the voyage was carried in casks not over clean and after filling allowed to lie in the hot sun several days before being placed on board. I remember

hearing him say that when taking a drink it was customary to hold the cup with one hand and the nostrils with the other. Could we imagine conditions like that today?

Now, is the human family all who benefit by the superiority of this age. Consider for instance the dairy cow of today and compare with her ancestor who was often forced to subsist or exist through the winter on twigs of the forest trees.—F. H. S., New York.

Provide Exercise for Sire—Now is a good time to plan for a suitable pen and yard for the herd bull. Bulls need exercise as well as good feed and care. No plan is as generally satisfactory as a large exercise yard connected with a suitable pen and the bull allowed to go in and out freely at all seasons of the year.

Choose Your Bedspring Wisely

ARE you a slave to spine sag? Do you envy those bright-eyed, snappy men who seem to effervesce with "pep"? Better investigate your bedspring.

Whether you sleep little or long there is one thing certain—you need the best of rest, and if you are wise you'll buy a Foster Ideal Spring. There are three convincing reasons why: First, the Foster Ideal with its 120 super-tempered spirals will give you finer spine support. Second, the Foster Ideal will give your tensed muscles greater relaxation. Third, the Foster Ideal will give your tired nerves a greater degree of sleep's real nourishment and recuperation, and this is the biggest reason of all why you need the Foster Ideal.

Foster Bros. Mfg. Co., Utica, N. Y.
Western Factory: St. Louis, Mo.

Makers of Bedsprings • Day Beds • Beds • Toe Trip Cribs
Upholstery Springs • Upholstery Spring Constructions

College Girl's Wardrobe

Scant Funds Require Very Careful Selection

HIGH school commencement was over and Virginia and Elizabeth were lazily rocking on the porch discussing summer plans. "Well I suppose clothes are the next thing on the program. College will open before we realize it, the summers are so short," this from Virginia.

Elizabeth sighed and finally answered—

READY-MADE ROMPER NO. B5210 comes in sizes one and two years. It is of fast color maize percale bound with white at neck, sleeves and bottom. The cute doggie design is stamped on, ready for working. Floss included. Price, 75c each. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

ed "Yes, if one had plenty of money how easy it would be, but when the pennies must be counted, it's not so simple."

Virginia's mother was sewing by the window and, laying aside her work, joined the girls and said in a rather hesitating way, "I couldn't help hearing your conversation, and I too have been thinking a great deal about clothes, for I want Jinny to have the prettiest outfit possible so I have a suggestion to make. Mrs. Morton has invited me to tea tomorrow as she is entertaining a friend from New York. This woman happens to be a professional shopper; she advises buyers and often provides whole wardrobes for people. Of course, she is accustomed to dealing with wealthy women but I am sure she could give you girls some good advice." Elizabeth and Virginia eagerly assented.

Mrs. Morton's friend proved to be a pleasant middle-aged woman named Rogers, and she gladly consented to help the girls out.

A few days later, Virginia's mother invited Elizabeth and her mother out to spend the day and meet Miss Rogers. When they were seated on the porch the girls produced note books and pencils and Miss Rogers discussed plans while they took notes. "First of all" said Miss Rogers, "unless you are exceptionally clever with a needle, plan to buy your things ready made; it is difficult to avoid a home-made look and, really, ready-made things are just as cheap. Avoid cheap stores. Go to the big department stores. So often clothes look attractive in the cheap stores but rapidly go to pieces and you girls will give your things hard wear."

"First of all, your coats. You each have a rain coat, but you need winter coats. If you decide upon fur coats, the August sale is a splendid chance. The first cost is big on a fur coat but your troubles would be over for your whole four years. However, there are many pretty cloth coats, only remember, you wear a coat quite a long time, so don't buy a conspicuous one that you and all your friends will soon tire of."

"A color scheme is best, then all accessories will match. Build your wardrobe around this color. Have a soft felt hat or two for sports and general wear. Then shoes—it is better to alternate several pairs of shoes, they wear better; don't forget shoe trees, and use them. Oxfords for every day, patent or kid pumps for dress up and

a pair of evening slippers that will harmonize with various evening dresses. Lisle stockings for sports, service weight silk and chiffon ones for dress-up. At least two dark silk dresses and a flowered georgette for teas, etc. Many girls wear sweaters and pleated skirts for classroom, although jersey and flannel dresses are also worn; a plain tweed coat for campus wear and, if the budget will admit, a leather jacket for hikes is comfy. Fabric gloves for general wear, kid ones for dress. If you live in a dormitory where they dress each night for dinner, this list may be scanty, but ordinarily two evening dresses will be needed, these need not be expensive; a warm bathrobe and lighter kimono or negligee. If you girls like to sew you could make pajamas and some of your undies, pongee is very satisfactory for slips. The sleeveless and 'backless' dresses for tennis made of pique or linen could be easily made at home. You would use them some this fall and they would be ready for the first warm spring days."

"If you live near the college a good traveling bag will be enough luggage to purchase for you will doubtless go back and forth by automobile, but if traveling by train, a wardrobe trunk will be needed. In buying luggage select the best you can afford, cheap luggage usually proves to be expensive." Miss Rogers paused for breath, the girls cried in unison, "Oh, thank you so much. We know just what we want now." And the mothers beamed their thanks too, while planning a shopping trip for the near future.—C. C., N. Y.

Education Through Pictures

"Education Through Pictures" by Royal B. Farnum and published by the Art Extension Society, 60 cents, is intended to help teachers or mothers in training children to love and appreciate pictures. The lists of pictures are graded so that suitable ones are used for children of different ages. Methods of teaching and

FUDGE APRON NO. C134 comes practically made up, all edges being bound and the two strings for straps being furnished. The circular flared skirt is very stylish and attractive. Material is a good unbleached muslin. Price, stamped for embroidery, no floss included, 40c each. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

of inspiring interest and appreciation of pictures are given. Interesting stories about 110 famous pictures and their painters, together with suggestive questions on these pictures make the volume very serviceable to teachers. It is intended to be used in connection with small colored prints of the masterpieces which may also be obtained at a reasonable rate from the Art Extension Society, 65 East 56th St., New York City.

Try to remove stains from clothes with clear cold water, before washing with soap. Soap sets many stains.

Aunt Janet's Counsel Corner

This Reader Does Not Consider the Fifty-fifty Question Settled

DEAR AUNT JANET:

I was very much interested in the letter from "Rebellious" and have waited impatiently for replies to be printed. I'd like to know how others feel. Do all women feel that way? All I know seem to. How do the men feel? The "Male Reader's" letter was all twaddle to my way of thinking, and really begged the question.

Any woman knows that it is staying right at home and working beyond her strength that makes her nervous and furthermore, no matter how much she loves her children, it is a relief to get away from them for an hour or two occasionally.

It is very easy for the "Male Reader" to advise "Rebellious" to cry off her vexation but that will not prevent either a nervous or physical breakdown. I don't think "Rebellious" or very many other women wish to wrest the position of head of the household from their husbands. I think most of them really wish just a little more consideration from the husbands who really love them but don't realize that a little thought on their part would help their wives both nervously and physically. Don't you think so?—WOMAN READER.

Woman Reader has waited quite some time to see what other readers think about some of the questions raised by "Rebellious" and answered in part by "Male Reader", although not entirely to Woman Reader's satisfaction. The question seems to be whether wives really are admitted to a fifty-fifty partnership with their husbands when important questions or a great deal of money may be involved. Or is it merely a myth that exists in theory but not in practice?—AUNT JANET.

Tested Recipes

Cucumber Salad

1 cup sliced cucumbers ½ cup diced celery
¼ cup shredded green 1 tablespoon chopped onions
peppers ½ teaspoon salt
¼ cup chopped pimientos ¼ teaspoon of paprika

Mix all ingredients and chill them.

For School Wear

COAT-DRESS NO. 2871 is delightful for the young girl's use at school. For early fall linen or light weight jersey and for cooler weather, plaid flannel or one of the heavier silks should be used. The pattern cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1½ yards of 40-inch material with ½ yard of 32-inch contrasting. PRICE 13c.

Serve in lettuce cups and top with salad dressing.

Olive Oil Pickles

25 large cucumbers—pare the rind off very thinly. Slice thin crosswise. To this amount add one cup fine table salt, and stir through. Let them stand for 24 hours, stirring them frequently. Then drain well and long. Boil 1 quart of good cider vinegar. Let it cool, cold. Then when cucumbers are well drained, add this vinegar also one tablespoon each of white mustard seed, yellow mustard seed, and celery seed, and one cup of olive oil. Mix through thoroughly, pour in jar (stone), cover, and they will keep. I have some now that were made one year ago and have sat on a pantry floor all that time and the pantry is behind the kitchen stove and the door always open.

Horseradish Pickles

To a gallon of small cucumbers which have been washed and soaked 24 hours

With or Without Sleeves

2907

DRESS NO. 2907 with its smart bib cape collar is distinctly individual in design, especially when made up in the printed sheer cottons so much in vogue. The rippling skirt is forecast for the best fall fashions and this one with scalloped yoke is charming. For fall wear, printed silk could be used for material. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2¾ yards of 39-inch material with ½ yard of 20-inch light and ¾ yard of 35-inch dark contrasting. PRICE 13c.

in a weak brine solution, add 1 cup of horseradish roots, sticking them in here and there. Cover all with cold, previously boiled vinegar and place a layer of green horseradish leaves over the top, cover with stone cover and keep in a cool place. This is my favorite pickle.

Piccaililli

1 cup salt 2 cups chopped cabbage
4 qts. green tomatoes, 1 cup chopped green peppers
chopped 2 cups chopped onions

Mix all together and let stand over night, then drain thoroughly and add the following:

2 qts. ripe tomatoes, qts. if strong and 1 qt.
peeled and chopped water
1 cup chopped celery 8 cups sugar
1 cup ripe red peppers, 2 tablespoons each celery
chopped seed and mustard seed
3 qts. mild vinegar, or 2 ¼ cup black peppercorns

Mix all well together, cook very slow-

ly for one hour, stir often, do not let scorch. Pour in sterilized jars and seal.

Chili Sauce

2 dozen ripe tomatoes 2 level tablespoons salt
3 ripe peppers (sweet) 1 level tablespoon each of
3 green peppers ground cloves, nutmeg,
3 onions ginger and allspice
1 quart vinegar

Scald and skin the tomatoes, then

The Tuck-In Blouse

2913

BLOUSE PATTERN NO. 2913 is both chic and useful to wear with the ever-ready sports suit. Made of eggshell crepe silk with bow tie of matching crepe printed in dots of contrasting shade, this blouse is the last word in smartness for sports wear. The pattern comes in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure and can be made in an hour. Size 36 requires 2 yards of 35-inch material with ¾ yard of 32-inch contrasting. PRICE 13c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the new summer fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Ave., New York City.

chop all vegetables fine. Put all into saucepan, cook slowly for 3 hours, bottle and seal.—CLARICE RAYMOND.

Betty Letters

DEAR BETTY:

I am a boy eleven years old. I help mother a lot in cooking. I like to cook too. Enclosed is 10c for which send me one of your scrapbooks with the first lessons in them already. I made the Yum Yum pudding and liked it. Yours truly, L. N., New York.

DEAR BETTY: * * *

Mildred is only 6 years old but is much interested to learn to cook especially since your little recipes have appeared in the American Agriculturist. I think it will be a wonderful help to all little cooks. Mildred has two younger sisters that will use the scrapbook with her. We wish you all good luck. Sincerely yours, MRS. L. A., New York.

DEAR BETTY:

I am thirteen years old. I received much pleasure from your recipes because I do most all the baking at home. I started to help mother with the baking when I was nine years old and still am helping her. Please send one of your scrapbooks for which you will find 10c.—X. D., New Jersey.

DEAR BETTY: * * *

I like your scrapbook very well. I have tried many things in it and I thank you very much for it, for it has taught me a lot already. My mother is willing to help me and everything I have tried to bake I have had a success in.

I have a brother and a sister and I am the youngest one in the family. Your friend, E. P. H., Pa.

The Plains of Abraham—By James Oliver Curwood

Everywhere along the unprotected frontiers the Indians were killing and burning and such vast sums were being expended by both sides for human hair that scores of white men had taken up the lucrative business of hunting for scalps.¹

¹Until 1637 scalping was unknown in New England. The church-loving Puritans began by offering cash for the heads of their enemies. Later these God-fearing people accepted scalps if both ears were attached. Bounties differed over a period of one hundred and fifty years, and in different parts of the country. The French were first to offer bounties for the scalps of white people, the English quickly following suit. At the time of this story, the English were offering as high as \$500 for a warrior's scalp, and from \$150 to \$50 for those of women and children, including the scalps of unborn babes torn from their mothers' wombs. French prices were somewhat lower than the English. Over a long period of years, human hair was a larger item of traffic than fur, and in one lot the Senecas delivered and received payment for ten hundred and fifty scalps taken from the heads of white men, women, and children along the frontiers. Christian races, not savage ones, were the inspiration behind these horrible deeds in that bloody dawn of our history when the United States was about to be born.)

Almost at the door to Jeems's home, war preparations were in progress, for every landed baron along the Richelieu was training his vassal farmers, and when the wind was right the Bulains could hear faintly the twice-a-week firing of muskets at Tonteur Manor. Being free of the seigneurial protection and laws, Henri did not go to drill. Nor did Jeems. Yet Tonteur rode frequently to their home, especially when Hepsibah was there. He was in better spirits than usual, and it was all on account of Toinette, he said. After all, there was a lot of himself in Toinette, and he thanked God for that blessing. She was homesick for the Richelieu. Her letters to him were filled with a longing for it, and she declared that, in another twelve months, when her schooling would be finished, she wanted to live at the Manor and not in Quebec. That was enough to make him happy, and he laughed at the thought of danger for womenfolk along the Richelieu—in the fortified places. The English and their savages would not get nearer than the lower end of Lake Champlain when war came; and they would be driven from there very shortly, and also from Lake George. But on such an outlying farm as the Bulain place, which had no protection whatever, there was the possible peril of wandering scalp hunters and he never tired of urging Henri and Catherine to make their home within the safety of the seigneurie.

He asked Jeems and Henri to come to his drill, and that they did not respond made no difference in his friendship. He could understand how hard it would be for Henri to prepare for war against his wife's country, and his secret adoration for Catherine was greater because of her courage and her faith in both peoples with the catastrophe so near. It delighted him to think that his own confidence was a comfort to her, and the eagerness with which she accepted his opinions as a soldier encouraged him to go beyond what Hepsibah considered intelligent bounds in giving easement to her mind. He did not guess what was in Jeems's heart, nor did the boy's father or mother. Only Hepsibah knew fully what was there.

Early in the autumn, the trader took Jeems on a journey to the English fort on Lake George, thence travelling into the New York country, returning in November. They found a change in Catherine. She was not less confident or less contented in the paradise she was helping to build, but something had come into her life which she was

accepting bravely and courageously and even with pride. One evening, she spoke of the military activities along the Richelieu. Many river youths were training with their elders, she said, and it did not seem right that Jeems should not be among them. While killing was wicked and inexcusable, it was a God-given privilege to defend one's home and family. She quoted Tonteur to substantiate her belief that war would never reach them, and she knew that Jeems would not seek it any more than his father. But she thought it would do no harm for Jeems to prepare himself

was left waving beyond the Alleghenies. French arms and Indian diplomacy were victorious along the Ohio and westward to the plains. The policies of the British Royal Governors were alienating their Indian allies, and in spite of their million and a half population against eighty thousand in New France, Dinwiddie had frantically called upon England for help. In response, England was sending General Braddock.

Paeans of gratitude and triumph were sung in the churches throughout New France because of the beneficence of this year, and in a double

freedom of the forest were in his blood, and behind these things was also the spirit of Hepsibah Adams. He knew that he could meet Toinette coolly and without embarrassment should they chance to stand face to face, no matter how splendid she had grown. And he realized there must be a great change in her. She was fifteen now. A young lady. At this period of his life, five years seemed a long time, and he thought it was possible he might not recognize her.

An overwhelming moment of shock seized him when at last he saw her.

It was as if a yesterday of long ago had come back into this to-day, as if a picture which had been burned and scattered into ash had miraculously been restored.

She was taller, of course. Perhaps she was lovelier. But she was the same Toinette. His dazed senses almost resisted the startling fact, which broke down the barriers he had built up about his dreams and castles as the walls of a pearl build themselves about a hurt. He could see no change in her except that she had become more a woman. Hepsibah's work, his own, his freedom, and his courage were dissipated like dust as he looked at her, and once more he felt himself the inferior being offering her nuts and feathers and maple sugar and praying in his childish way that she might smile on him. This was not a new Toinette removed another million miles away from him, as he had supposed she would be, but the old Toinette, commanding him to slavery again, stirring anew the rubbish heap of his broken and discarded hopes, touching fire to half-burned-out desires, challenging him, dragging him from his pride and his strength and making his blood run hot in his body. Yet she had not seen him!

At least, he thought she had not. With a group of young ladies from the neighbouring seigneurie, she had come down from the big house, and he was almost in her path, with Peter Lubeck at his side. It was Peter who advanced a step or two toward them. Except for his action, Toinette would not have turned, Jeems thought. He pulled himself together and stood with his head bared, as cold and impassive in appearance as a soldier at attention, while his heart beat like a hammer. Toinette had to face him to return his companion's greeting.

It was impossible for her not to see him when she made this movement. But there was a slowness in her discovery, an effort to keep from looking at him which was more eloquent than words. Toinette had known he was there. And it had not been her desire to speak to him.

If he needed courage, it was this enlightenment which gave it to him. He inclined his head when she met his gaze. Her face was flushed, her eyes darkly aglow while his own cheeks bore only the colour of sun and wind. He might never have known her, so unmoved did he stand as she went on her way.

She had slightly nodded, her lips had barely formed a name.

In spite of all his uncle had said, there were hatreds which would not die!

Later, after the feast on the green, came Tonteur's spectacular feature of the day, a military review of his tenants, with wives and children witnessing the martial display. The male guests, who had drilled in their own seigneuries, joined Tonteur's men. Only Henri Bulain and Jeems were not among them. Henri, sensitive to the fact, and to save Catherine from the hurt which might arise because of it, had started with her over the homeward trail half an hour before. Jeems had remained. This was his answer to Toinette's contempt—that he was not of her people, that his world was not circumscribed by the petty boundaries of the seigneurie.

(Continued on Page 18)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems apologizes to Toinette and Tonteur visits the Bulain home where he and Hepsibah have another friendly (?) battle much to Catherine's dismay.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth.

along with the other young men of the seigneurie.

To this suggestion Hepsibah's homely philosophy made objection. He told Catherine the day was coming when Jeems would be compelled to fight and that he would have to choose one side or the other to champion. When that day arrived, sentiment would not stand in the way, for, with a world in turmoil about them, one could not be English and French at the same time. He declared that even Henri would be drawn into the struggle, unless the scalp hunters came to solve the problem for them all. No man could tell on which side they would be when forced to it, and as he despised a traitor more than anything else, it was his opinion that Jeems should not be taught the ways of war under the flag of France and then, it might be, fight for the English. As a frontiersman, he maintained that the finest fighting man was the Long Rifle, a free wanderer of the forests, a leather-stocking trained to a hundred greater things than the firing of a musket in company with a score of others. That was what Jeems should be. He was already fitted for it, lacking only a wider experience. As a Long Rifle he could serve where honour and duty called him when the act became necessary.

This discussion was the beginning of another phase in Jeems's life. It placed before him certain definite obligations of manhood which even his mother had to recognize, though she wanted to hold him as long as possible in his boyhood years. During the next year he made several trips with Hepsibah, going to Albany and as far as the country of Pennsylvania. Each time he returned to his home something held him more closely to it.

In the autumn of 1754, after four years at school, Toinette returned to Tonteur Manor.

In this same month of September the seventieth acre of land was cleared on the Bulain place.

Peace and happiness lay over the Richelieu. It had been a splendid year for France along the far frontiers. Washington had surrendered at Fort Necessity, and Villiers was triumphant at Fort Duquesne. England and France were still playing at the hypocrisy of friendship. While they played, thrusting at each other secretly and in the dark, not an English flag

rejoicing over Toinette's homecoming and his country's success at arms, Tonteur planned a levee and barbecue at the seigneurie. Hepsibah was away at the time, which disappointed the baron, who insisted that Henri and his family must attend the celebration or he would never call them friends again.

Jeems felt a thrill growing in him as the day drew near. With it was no apprehension or thought that it would be easier not to go than to go. He was no longer the Jeems of Lussan's place as he set out in the company of his father and mother with Odd pegging alone faithfully at his side. In January he would be eighteen. The alert and sinuous grace of one of the wild things of the forest was in his movements. Catherine was more than ever proud of him and rejoiced in the cleanness of his build, in his love of nature and God, and in the directness with which his eyes looked at one. But she was not more proud than Hepsibah Adams, who had seen in this pupil of his flesh and blood the qualities and courage, the lock, stock, and barrel, as he called it, of a fighting man.

Yet, on the morning when they started for the levee, much of the boy of years ago was in Jeems's heart, though it did not reveal itself in his face and actions—not the boy who had thrown mud but the boy largely moulded by the Indian trader. To this part of him Toinette would remain a living memory forever, no matter what happened—the Toinette of his earliest days, the Toinette to whom he had carried his presents from the woods, the Toinette who had accepted his gift at Lussan's sale. He had wondered at the fate of the piece of red velvet, and once, a long time ago, when hunting near Lussan's, he had dug the old barnyard half over in search of the unrecognizable rag into which its glory must have fallen, if as he believed, it had been trampled into the mire by the conflict of that day.

He was anxious to see Toinette, but with this desire there remained none of the old yearnings which had once oppressed him. She whom he was going to regard to-day was a stranger, one into whose presence he was determined not to force himself again. This resolution was not inspired in him by a lack of boldness or an uncertainty as to his own social fitness. An immense pride upheld him. The spirit and

With the A. A. Poultry Farmer

Fewer Hens--More Chicks

POULTRYMEN in AMERICAN AGRICULTURIST territory are naturally interested in prospects for prices during the coming fall and winter. The U. S. Bureau of Agricultural Economics in a report just issued, gives some figures which will at least form a basis for a guess as to what may be in store for them.

On July 1, poultrymen over the entire country owned 4 per cent fewer laying hens than they did on July 1, 1928. Apparently, however, these hens were of slightly better quality as production estimates for the first six months of the year, were only 1 per cent less than they were a year ago. At the same time, the receipts at four of the largest terminal markets for the first six months, showed a decrease of 5 per cent. During the first three months of the year, receipts at these markets were much lower than they were for the corresponding three months in 1928, while receipts during the last three months were only about 1 per cent lower than they were in April, May and June last year.

More Chicks Raised

There are 10 per cent more young chickens on farms than there were a year ago. There was a reduction in chicks raised last year, so that the figures this year are approximately the same as they were in 1927.

From these figures it would seem that egg production during the fall should continue lower than for the

same period last year, but when the pullets come into production, production may be expected to be slightly higher than it was in the winter of 1928.

Prices for poultry are the highest they have been since 1928. If feed prices should rise this fall there would be a big incentive to cull the flock very closely which may reduce the birds put into laying houses. High poultry prices might result not only in culling out low producers during the remainder of the summer, but also in culling out the pullet flock more closely than would be done if poultry prices were not so attractive.

Fewer Eggs in Storage

Lower cold storage holdings of eggs are another factor which may affect egg prices next winter. On July 1, there were 8,499,000 cases in storage in the entire United States as compared with 10,002,000 cases on July 1 last year and a five year July 1 average of 9,573,000 cases.

As compared with other years, it is believed that chicks were hatched relatively later last spring, and as a result many pullets will not come into production until late next fall. This will have some slight effect on production as records show that early hatched pullets produce the heavier.

It would seem to be good business to do everything possible to maintain production this summer, to cull non-producers closely now and to cull out some of the poorer pullets before they go into winter quarters.

The Plains of Abraham

(Continued from Page 16)

He stood with his long rifle in the crook of his arm, conscious that she was looking at him, and the invisible shafts from her eyes, poisoned with their disdain, stirred him with the thrill of a painful triumph. He could almost hear her calling him an English beast again. A coward. One to be distrusted and watched. He did not sense humiliation or regret, but only a final widening of what had always lain between them.

He bore this feeling home with him. It grew as time went on and with its growth an increasing restlessness came over him. The nearness of Tonteur's princely possessions to Forbidden Valley cast a shadow which sometimes repelled him; and at others drew him toward it, until in one way or another he was beginning to find himself never quite free from its influence.

The gulf between reality and the visions of his childhood became so vast that in a little while he was scarcely able to see across it. As this happened, his eyes turned the other way as if drawn by a gentle and yet irresistible force which was determined to impress on him more and more the fact that down there, in his mother's country, were freedom and happiness and equality among men which the growing shadow of the Tonteur seigneurie was holding back from him here. Against this call of a new motherland to which he was a stranger fought his love for the things to which he had been born, and so twisted did his thoughts become with the conflicts within him that only hard, long miles of travel through the forests could subdue the fires they built.

News creeping through the wilderness and reaching every corner, like the whispering winds, kept an unquenchable heat under the ash of these fires, fanning the embers into flames in spite of him. Secrets were no longer secrets. Rumours had grown into facts. Fears had become realities. England and France were still playing at peace in their mighty courts. In the sunlight they were friends, in the dark they were seeking each other's lives like

common cutthroats. Their catspaws, New France and the Colonies, had been prepared for their immolation—Wilderness Children, plastic, moved by youth, inspired by faith, filled with courage, urged to destroy and to pile destruction on destruction by two scoundrels aged in their cleverness, France and England. Two freebooters of the sea, two footpads on solid ground, deep in the mire of their plottings, and unconsciously, building the foundation for a nation greater than themselves.

But New France, with a child's blindness to the faults of its parent, loved the rotten court of Louis XV, which it called home.

And the thirteen little Colonial governments of the English, quarrelling like small boys among themselves, just beginning to walk alone, feeling the significance of the new word *American*, cheated by their parent, laughed at by their parent, hated by their parent, still yearned for the love of that parent as children have wanted love from the beginning of time, and were loyal to it.

When Writing Advertisers, Be Sure to Mention American Agriculturist

Tiring Out a Customer

Some time ago I wrote you regarding an unsatisfactory experience with the Tailoring Co., of Fifth Avenue, New York City. After you wrote to them, I returned the suit to them and they sent another one, which did not fit any better than the first one. I sent this one back to them and I received a letter asking why it did not fit. I wonder if I am supposed to know why their tailors cannot cut and tailor a garment or why they are so neglectful in their business transactions, or why they are unreliable. As a matter of fact, there is no fit to the suit. The claim is not settled. As yet they have made no offer to settle it nor did they make any effort to alter the suits and get them back to me. The first order was given them nearly four months ago and I have neither suit nor money.

THE experience of our subscriber is similar to many others. While we have no quarrel with a number of companies who sell suits either through

Promptness Appreciated

I AM writing to let you know that I received the check for \$130.00 on the insurance policy that I had with your company which I appreciate and want to thank you very much for. I had my leg broken on March 11 and was confined in a hospital for nine weeks and the balance of the time at home unable to work.

There are a great many in my community who have this same insurance; some have said to me so cheap an insurance is no good and I had thought that I would receive nothing but I have found out by my own experience that you are honest people and stand by your word and have treated me right in every way.

You will do me a favor as well as yourself if you will please print this letter in one of your coming issues of the American Agriculturist.

Will you also please send me full information concerning your higher priced policy as I want to take out another policy for more protection.

Thanking you again.

Harvey Beatty,
Newton, N. J.,
R. 3

the mail or by agents, we find there is a considerable number who sell suits of doubtful value and who apparently plan on tiring out their customers by repeated correspondence rather than by attempting to give satisfaction.

We suggest to our subscribers who plan to order clothes either from a mail order house or directly through agents that they first inform themselves as to their reliability. As above stated, there are a number of concerns who follow these plans who are thoroughly reliable.

Is the Premium Worth the Cost?

I had letter and shipping tags from New York, asking me to ship him my eggs. I shipped one case last week and got 3 cents a dozen more than I got for a case sent the same day to another place. Will you please let me know if he is all right and oblige.

THE only information we are able to give on this firm is that they are not listed among the licensed and bond-

ed commission merchants, neither can we find them in our Credit and Market Guide. We do know that often firms will pay a premium on the first eggs shipped to them but producers who continue to ship to them, discover that they either get less than they expect on further shipments or they fail to receive any pay and are subsequently unable to locate the person to whom they shipped, thus taking a total loss on the last shipment made.

The only safe rule to follow is to ship only to licensed and bonded commission merchants or to other firms who have been in the business for years and have established an unquestioned reputation.

Valuable (?) Information

WE have recently received one or two letters from subscribers who have been approached and informed that they are entitled to a portion of an estate of a wealthy relative who has just died.

One concern which is apparently sending out this information broadcast, intimates that valuable information will be sent on receipt of a dollar. In no case as far as we know has any valuable information been received by those who paid the dollar.

Metropolitan Residents Do Not Always "Read Before They Sign"

AT one time there was a general impression that it was easier to dupe farmers than it was to sell gold bricks to the city business man. It appears now that farmers either look with greater suspicion upon promoters of slick schemes or that city dwellers are easier to sell than they once were.

The National Better Business Bureau just recently tells of a scheme under the name of the International Transportation Association which sent out thousands of blank forms closely resembling an ordinary questionnaire. Many concerns filled them out and signed them under the impression that they were supplying information, but later received bills for amounts varying from \$75.00 to \$100.00 and on inquiry were informed that they had signed a valid contract ordering advertising space in one of the company's directories.

An interesting feature of this case is that many who signed the contract refused to pay and the International Transportation Association took legal action to collect. In some cases the Courts have held that the papers signed was a binding contract while other Courts have held that the defendant was not bound by the so-called contract.

It seems rather evident that both these decisions cannot be right and the whole case emphasizes the uncertainty of going to law.—Again we repeat—**READ BEFORE YOU SIGN.**

Fraud Order Issued Against Underground Aerial Co.

DURING the past year or two we have received numerous letters inquiring as to the reliability of a Chicago company manufacturing an underground radio antennae. Letters from subscribers indicated that the results secured were poor and that efforts to secure adjustments were unsuccessful.

On July 2nd a Postal fraud order was issued against the Modern Antennae Co., the Underground Aerial Products Co., and the Perfection Antennae Co., of Chicago. After a lengthy investigation the Postal authorities decided that the evidence shows that "This is a scheme for obtaining money through

the mails by means of fraudulent pretences, representations and promises."

When Dogs Injure Your Livestock

(Continued from Page 3)

law provides that no owner can collect damages for injury or destruction by a dog not wearing a tag attached to the collar. This practically allows a person to kill a dog at any time if he is not wearing a license tag. Furthermore, the law states that if a dog attacks a person who is peaceably conducting himself in any place that he may lawfully be, that this person or any other per-

A "Thank You" Is Our Pay

I WISH to thank you for your kind attention in regard to the difficulty I had with the Company about my order. I have received the goods, and I am entirely satisfied.

I appreciate your attention, and I will give your publication recommendation whenever possible.

son who sees the dog, may kill the dog and that the owner may not collect for damages or death to the dog. If the dog attacks, chases or worries any domestic animal, including sheep, horses, cattle, goats, swine, fowls, ducks, geese, turkeys and domestic rabbits, so long as these animals are where they may lawfully be, the owner or any other person who sees the attack may, for the purpose of preventing a killing or injury of such animals, kill the dog. It was this provision that was characterized by sportsmen as allowing anyone to kill any dog that so much as looked at a hen.

Night Quarantines

The question of night quarantines has received considerable discussion both favorable and otherwise. It is the policy of the Department of Agriculture and Markets to put a night quarantine on a county only where such action is requested by the county. Furthermore, it is not considered that it is the duty of the state to enforce such a quarantine but rather that the state gives the county the authority to enforce it. The law on night quarantines states that the Commissioner may require all dogs in any town, city or county, to be secured confined between sunset and an hour after sunrise where a night quarantine is in force. Any peace officer shall kill on sight, any dog at large in violation of the order when not accompanied or under full control of his owner. In any county where damages from dogs are becoming excessive, live stock owners may get together and request the Commissioner to put a night quarantine on a particular town or the entire county. It is then up to local authorities to see that the law is enforced.

There are several things which we consider important in a sane enforcement of the dog law. In the first place, it is important that live stock owners acquaint themselves with the provisions of the law. We have given what we consider some of the more important points. Anyone who wishes to study the matter farther may write to the State Department of Agriculture and Markets at Albany, N. Y. and ask them for a copy of chapter 173 of the Laws of New York which gives the full details of the present law.

The second important point is that all local authorities and peace officers should be thoroughly informed as to the provisions of the law. If it becomes apparent that such is not the case, it may be decidedly worthwhile for local organizations such as the Grange, Farm Bureau or county breeders' associations, to discuss the matter and bring the whole proposition to the attention of the proper authorities.

The third essential is a strong public opinion. Where united action has been taken by live stock owners within the county, it has been found that it

EDWARDS METAL ROOFING

BIGGEST VALUE · LOWEST COST

Buy your metal roofing, shingles, Spanish tile, sidings, etc., DIRECT from the world's largest manufacturer of sheet metal building materials, at BIG SAVINGS. Thousands of satisfied users.

We own our own rolling mills. Enormous output insures lowest production costs. Factory-to-consumer plan makes prices rock bottom. You get the benefit. Many varieties. Edwards metal roofs last longer, look better. Resist rust, fire and lightning.

has been possible to cut down the dog damage and the amount of money required to indemnify live stock owners.

It would evidently be unfair to have one set of laws applying to dogs owned in cities and villages and another set of laws to apply to dogs owned in the country. Many farmers own dogs for hunting and many others are dog lovers who have a pet for the boys and girls. We believe there is a decided tendency away from cow dogs. A good cow dog is rare and chasing does not benefit high producing cows.

We also have considerable doubt as to the value of watch dogs. There are doubtless cases where they are of value yet we know of several instances where chicken thieves walked off with the entire flock right under the nose of the faithful watch dog. Our point in mentioning this is to emphasize the fact that if live stock owners wish to a law which adequately protects against loss, that they should abide by the provisions themselves.

The Sign of Protection

Ideas Pay Dividends

(Continued from Page 3)

can start it in the same way by getting a number of large envelopes, 9x12, or even larger sizes, and write on them the following subject headings:

APPLIANCES

In this envelope place all clippings of advertisements and articles on brooders, coops, drinking fountains, egg carriers, egg testers, electric hovers, feeders, grain sprouters, incubators, leg bands, trap nests, troughs, and other poultry appliances.

BREEDING

This will contain clippings on selection of breeders, fertility, mating, incubating, egg testing, line breeding, cross-, in- and out-breeding, and other subjects concerning breeding.

BOOKS AND MAGAZINES

Containing catalogs of books which may be purchased at a later date, and names of magazines which may be subscribed for sooner or later.

CAPONS & CAPONIZING

All data concerning suitable breeds, how to caponize, time to caponize, instruments, operation, feeding, marketing, etc.

CHICKENS, Varieties of

Clippings concerning breeds.

CHICKS, Baby

Information concerning brooding, feeding, housing, range, shade, cleanliness, sickness and other subjects.

CULLING

When to cull, kind to cull and kind to save, etc.

DISEASES

Data concerning treatment and prevention of chicken pox, diarrhoea, roup, worms, and other diseases; the prevention and killing of lice, mites, fleas, etc.

DON'TS IN POULTRY RAISING—and Miscellaneous unclassified

A miscellaneous collection of what not to do, and of material not readily filed under any other subject head.

EGGS

Containing information concerning the handling of eggs, preserving, candling, cleaning, washing, electric light methods of production, egg testers and egg grader scales, etc.

FEEDING

Data concerning feeders, kinds of feed such as grain, sprouted oats, mash, kale and other vegetables, rations to use, feeding management, etc.

HOUSING

Data on best types of houses, yards, fencing, gates, ventilation, plans, and other subjects.

MARKETING—of eggs—of table fowls

Information on how and where to sell eggs, care and preparation, cartons for carrying them, gathering and storing, grading and packing, how to get the most for chicks and chickens, broilers, hens, capons and live poultry.

RECORDS

How to keep records of eggs, costs, and other data.

SHOWS

Information concerning prizes, types of chickens, preparing birds for exhibition, where held, kinds of shows, coops to display, shipping, show rules and regulations, etc.

As you read articles on these informative points clip and file them away in these envelopes. As you read books write the title of the book, the author, the chapter number, and the page where found, concerning any of these subjects on a slip of paper and file it away. In this way you will soon have a world of ideas at your command on any subject, and you can quickly refer to them any time you want the information. Keep the envelopes alphabetically and the index as you go along. Always before you as you can quickly tell just where the material is filed in your collection.

From Autocar to Wallis— car truck or tractor —here is your guide to real lubrication economy

Way back in 1905 Mobiloil Lubrication Engineers proved that no one oil could be correct for all kinds of automotive engines. So they analyzed each type and perfected different oils especially fitted for the work they had to do. That was the real beginning of scientific lubrication.

Then in 1906 the world's oldest specialists in lubrication took another forward step. They made this valuable information available to every farmer throughout the land through the first Mobiloil Chart of Recommendations—the first scientific guide to efficient and economical engine operation in automobile history.

So famous has this chart become and so successful the results obtained from following it that:

182 manufacturers of automobiles and motor trucks approve its recommendations for their cars.

43 stationary and farm lighting engine manufacturers recommend Mobiloil.

31 farm tractor manufacturers recommend Mobiloil.

90% of the tractor manufacturers whose machines have gone through the gruelling Nebraska State Tests put their faith in Mobiloil—they couldn't afford to take chances with oil.

That's what the men who make your engines think about Mobiloil protection. That's the kind of reputation Mobiloil quality has built up through the years.

New savings with the New Mobiloil

Far-sighted farmers have always found Mobiloil the cheapest oil to buy for year-round use in every kind of engine, because it lasts longer. But now Mobiloil savings are even greater with the New Mobiloil—an improved Mobiloil made to meet the new lubricating needs of today's high-speed automobile engines and heavy-duty farm machinery.

The Mobiloil Chart becomes more than ever the guide to lubricating economy because exhaustive tests have conclusively proved that the continued use of the New Mobiloil gives a reduction of at least 20% in oil consumption when compared to other oils generally sold for the same engine.

TRANSMISSION AND DIFFERENTIAL:
For their correct lubrication use Gargoyle Mobiloil "C" "CW", Mobilgrease, or Engine Oil, as recommended by complete Chart available at all dealers'.

All authorized Mobiloil dealers now have a complete stock of the New Mobiloil. And you can buy this improved farm oil at no increase in price. Ask your dealer to refer to his Mobiloil Chart for the correct grade to use in your car, truck or tractor.

NOTE: For a season's supply we recommend the 55-gallon or 30-gallon drum with convenient faucet.

Health Commissioner Wynne Tells of the Importance of Pure Milk--Page 3

It Digs the Potatoes, Shakes Dirt Off, and Puts Them in Rows

The McCormick-Deering Potato Digger

Rod-link diggers in 6-foot, 2-horse; and 7-foot, 4-horse sizes; with shaker and vine turner, or extension elevator delivery. Also 6-foot 2-horse riddle-type diggers, with shaker and vine turner.

THE McCormick-Deering Potato Digger changes the hardest job in potato growing to almost a pleasure. It speeds up the harvest, does away with a lot of hired help, and cuts harvest costs so low that a good profit is assured.

It's a wonderful feeling to sit on the seat of this digger and see it root out every hill without cutting or bruising. You will like the way the adjustable apron shakes the potatoes free of vines, dirt, and stones. The ease of gathering the clean, trash-free rows of potatoes will surprise you. Users say it is easier to pick up behind a McCormick-Deering than any digger they have ever used. Faster gathering saves you money, too, because it reduces losses due to sunburn and exposure.

Ask the McCormick-Deering dealer near you to show this digger. In the meantime, write for our Potato Digger Folder. Address

INTERNATIONAL HARVESTER COMPANY
606 So. Michigan Ave. OF AMERICA Chicago, Illinois
(Incorporated)

Regular Equipment includes two-wheel tongue truck, spade lugs, standard-size shovel. Special Equipment: Roller truck, short shovel, side-hill lugs, and four horse hitch for 6-foot diggers. Attachments: Road rings, rolling cutters, stone trap for rod-link diggers, parts for attaching engines, tractor hitch, and side-hill lugs.

Ready for You—Now YOUR CRAINE-LINE SILO

Last spring we re-arranged our factory making it, we believe, the best equipped in the East. Therefore, we are filling all orders for Craine-Line Silos promptly when order is received. Prompt shipment does not mean lack of attention. Phone or wire your order, if necessary. Rock-bottom prices guaranteed. Choice of five kinds.

LET CRAINE

The Farm Relief Law

What It is--What It Can Do

FEW eastern farmers have taken much interest in the new Federal Farm Relief Law passed by the last session of Congress. However, the Farm Board created by this law has been appointed and is now at work, and the Board has power under the law to create policies which may affect either for weal or woe every farmer in the United States. Therefore, it certainly is necessary for every well-informed person, and especially every farmer, to know the fundamental principles included in this new farm legislation.

How will this Farm Board go about its job? The answer is that in general it will of course follow the plan laid down in the law. What is the law? On this page we are giving a summary of the most important parts of the law, which can be read in a few moments' time, and which should be saved for future reference.

Declaration of Policy

SECTION 1. (a) That it is hereby declared to be the policy of Congress to promote the effective merchandising of agricultural commodities in interstate and foreign commerce, so that the industry of agriculture will be placed on a basis of economic equality with other industries, and to that end to protect, control, and stabilize the currents of interstate and foreign commerce in the marketing of agricultural commodities and their food products.

(b) There shall be considered as a surplus for the purposes of this act any seasonal or year's total surplus, produced in the United States and either local or national in extent, that is in excess of the requirements for the orderly distribution of the agricultural commodity, or is in excess of the domestic requirements for such commodity.

Federal Farm Board

SEC. 2. A Federal farm board is hereby created, which shall consist of eight members to be appointed by the President, by and with the advice and consent of the Senate, and of the Secretary of Agriculture ex officio. In making the appointments, the President shall give due consideration to having the major agricultural commodities produced in the United States fairly represented upon the board. Each appointed member shall receive a salary of \$12,000 a year.

Advisory Commodity Committees

(B) The board shall invite the cooperative associations handling any agricultural commodity to establish an advisory commodity committee to consist of seven members, of whom at least two shall be experienced handlers or processors of the commodity, to represent such commodity before the board in matters relating to the commodity. Members of each advisory committee shall be selected by the cooperative associations from time to time in such manner as the board shall prescribe. No salary shall be paid to committee members, but the board shall pay each a per diem compensation not exceeding \$20.

(D) Each advisory committee may by itself or through its officers (1) confer directly with the board, call for information from it, or make oral or written representations to it concerning matters within the jurisdiction of the board and relating to the agricultural commodity, and (2) cooperate with the board in advising the producers through their organizations or otherwise in the development of suitable programs of

planting or breeding in order to secure the maximum benefits under this act consistent with the policy declared in section 1.

Special Powers of Board

SEC. 5. The board is authorized and directed—

(1) To promote education in the principles and practices of cooperative marketing of agricultural commodities and food products thereof.

(2) To encourage the organization, improvement in methods, and development of effective cooperative associations.

(3) To keep advised from any available sources and make reports as to crop prices, experiences, prospects, supply and demand, at home and abroad.

(4) To investigate conditions of overproduction of agricultural commodities and advise as to the prevention of such overproduction.

(5) To make investigations and reports and publish the same, including investigations and reports upon the following: Land utilization for agricultural purposes, reduction of the acreage of unprofitable marginal lands in cultivation, methods of expanding markets at home and abroad for agricultural commodities and food products thereof, methods of developing by-products of and new uses for agricultural commodities and transportation conditions and their effect upon the marketing of agricultural commodities.

Revolving Fund

SEC. 6. There is hereby authorized to be appropriated the sum of \$500,000,000, which shall be made available by the Congress as soon as practicable after the approval of this act, and shall constitute a revolving fund to be administered by the board as provided in this act.

Loans to Cooperative Associations

SEC. 7. (a) Upon application by any cooperative association, the board is authorized to make loans to it from the revolving fund to assist in—

(1) The effective merchandising of agricultural commodities and food products thereof;

(2) The construction or acquisition by purchase or lease of physical marketing facilities for preparing, handling, storing, processing, or merchandising agricultural commodities or their food products;

(3) The formation of clearing-house associations;

Pure Milk Saves Lives of Thousands

Why New York City Has Best Supply in the World

HAD the conditions prevailing in the milk industry fifty years ago persisted to the present time, over 180,000 babies would have died in New York City alone during the past ten years. This saving of life represents the entire population of a city nearly as large as that of Syracuse. Fifty years ago nearly one out of every four babies born in New York City died before reaching its first birthday; at present only one out of sixteen or seventeen dies in the first year.

A large measure of the credit for this achievement belongs to the vigorous campaign of health departments the country over against summer diarrhea, that warm weather ailment of babies which used to be called "cholera infantum" and was once so common and so frequently fatal. During the summer of 1901 in New York City summer diarrhea alone cost the lives of 4,404 young children; during the summer of 1927 only 246 died of this ailment, in spite of the fact that the city's population had increased nearly fifty per cent.

An advance to be proud of, this. And it is due chiefly to one factor—pure milk. New York City's regulation of the production and sale of milk and the hearty cooperation of milk producers have eased the hearts of many anxious mothers, for summer diarrhea, it has been found, is caused almost solely by milk of poor quality, laden with bacteria. By insuring a supply of pure milk, New York bestows the boon of health upon many of its new-born and helpless citizens who otherwise might suffer and succumb under that former scourge of early childhood.

Sometimes it may seem to dairymen and milk dealers that the laws governing the city's milk supply are unduly drastic. It must then be remembered that the milk industry is not a commercial enterprise. It is a public service, touching the lives and health of the community. Through cooperation between health authorities and milk producers the present high level has been attained with its gratifying results in the lowering of infant mortality and the disappearance of milk-borne typhoid fever epidemics and tubercular infection caused by infected cattle. At the present time, the milk supply of New York City is probably better than that in any other large city in the world. Because the milk industry realized the necessity for providing pure milk and conducting all its operations according to the highest sanitary standards, there has developed so much public confidence in the purity and safety of the milk sold in New York City that it has become an increasingly favored article of diet, not only for children, but for adults. In other words, the introduction of sanitary methods has paid by an increased market.

The fact that the dairies supplying New York City's milk are run on scientific lines and regulated by the Sanitary Code gives the babies of the city a chance for health which was denied them in the days when pasteurization and cleanly methods of production were unknown. Babies depend on milk for almost their entire nourishment. By guaranteeing a pure milk supply, the modern dairyman contributes a large share toward maintaining the community's well-being. Because a constant, pure supply of milk is easily available, thousands of babies in New York's crowded districts find the strength to cope with the stifling months of summer; thousands of mothers are spared the agony of watching their little ones fight a pitiful and losing battle for health and even life at the approach of summer.

In regulating the city's milk supply, the Department of Health has realized that it costs money to run a scientific and sanitary dairy. It has raised no objection to the farmer's securing proper compensation for his milk. The result is that, whereas milk was formerly sold in the city at 8 cents a quart bottled and 6 cents loose, it now sells for 19 cents a quart, Grade A, bottled; 16 cents a quart, Grade B; and 12 cents a quart loose.

Milk production today is on a basis of

By **SHIRLEY W. WYNNE, M.D., DR. P.H.**

Commissioner of Health, City of New York

good business methods. There is cooperation between dairymen and health authorities. The State even reimburses the farmer if it condemns his cattle as tuberculous. In this connection, farmers might remember that, though they are paid for the cattle they lose through condemnation, no one can reimburse a mother who loses a child because of poor milk.

Dr. Shirley W. Wynne, New York City Health Commissioner.

The growth of sanitary methods in milk production runs parallel with the growth of bacteriology. As science progressed in its knowledge of the germs causing disease, many discoveries were made regarding milk. It was found not only that infected milk could cause tuberculosis, typhoid fever, diphtheria, scarlet fever, septic sore throat and other infectious diseases, but that milk containing an excessive amount of seemingly harmless bacteria would occasion epidemics of summer diarrhea among the babies of a community.

Pasteur in the sixties and seventies of the last century discovered that bacteria cause disease. His technique, however, was complicated and it was difficult to isolate the germs of the various diseases. At the end of the seventies and in the early eighties, the great German scientist, Koch, improved the technique and with his pupils found the bacteria causing tuberculosis, cholera, typhoid fever, diphtheria and lockjaw. This advance marked the beginning of modern bacteriology. Following these discoveries, investigators naturally began the search for the particular bacteria responsible for other diseases.

During the course of each summer there was always a large number of deaths from what was called "cholera infantum". Mothers dreaded the hot weather because they knew that their babies would be apt to contract the illness and to die from it. The bacteriologists now set out to find its cause.

From 1903 to 1904 in this city, Holt, the well-known baby specialist, and Professor William H. Park, head of the Health Department's research laboratories, carried on an investigation into the causes of cholera infantum. They showed that this illness could be traced to no one specific germ, but rather that milk containing an excessive number

of bacteria made the babies sick. These studies proved that there are three reasons for a large amount of bacteria in milk. These reasons are: uncleanly conditions on the dairy farm; the temperature at which the milk is kept; and the length of time the milk is kept.

So far as the first point goes, the investigation showed that many of the dairies supplying New York City were filthy. The cows' flanks were unclean and their udders dirty; the stables were dark and dusty and the walls and ceilings cobwebbed. There were no facilities for the milker to wash his hands. These conditions not only were found in the dairies supplying New York City, but prevailed everywhere. The reason such conditions existed was because it was not then known that they were responsible for the heavy contamination of milk with bacteria.

Further, the studies showed that bacteria multiply very rapidly in milk which is not quickly cooled and kept cool. In clean dairies where every precaution was taken to obtain a clean milk it was found that the milk quickly turned sour due to the rapid multiplication of bacteria in milk which had not been cooled.

It is practically impossible to obtain milk absolutely free from bacteria. Even when freshly drawn from the cow, with every reasonable means taken

Why It Is Necessary To Cool Milk Rapidly

How Warm Weather Increases Bacteria in Milk

	Milk I Fresh and of Good Quality	Milk II Fair Quality	Milk III Poor Quality
Original number of bacteria per cubic centimeter.....	5,200	92,000	2,600,000
After two hours.....	8,400	134,000	4,220,000
After four hours.....	12,400	470,000	19,000,000
After six hours.....	68,500	1,260,000	39,000,000
After eight hours.....	654,000	6,800,000	124,000,000

to insure cleanliness, it will contain from 500 to 5,000 bacteria per cubic centimeter. For the health administrator, the bacteria in milk have great practical significance, despite the fact that the majority of these bacteria are saprophytes, i.e., not disease producing; from their number one can determine something as to the care taken in handling the milk.

Few, even of the well informed, appreciate how great a difference a few degrees in temperature will make in the rate of bacterial multiplications. Milk rapidly and sufficiently cooled keeps almost unaltered for thirty-six hours, while milk insufficiently cooled spoils rapidly. The cooling should be carried out as soon after milking as possible so as to keep the number of bacteria down to a minimum. In hot weather it is practically impossible to do this without refrigeration. How rapidly a few hours' exposure of milk to the ordinary temperature of a hot summer's day will increase the number of bacteria in the milk can be seen from the table on this page summarizing an experiment carried out by Park in the laboratories of the New York City Department of Health. Three different samples of milk were examined, the milk being kept at 32 degrees Centigrade (90 degrees Fahrenheit).

The Department of Health in 1906 organized its system of country milk inspection. It prepared a score card enabling the farmer to see just what were the deficiencies of his dairy. The inspectors aided the farmer by giving advice as to how he might overcome various deficiencies and improve the quality of his milk. The requirements were gradually made stricter and within a few years there was a marked improvement in the city's milk supply.

A number of large outbreaks of typhoid fever in New York City during the years 1909, 1910, 1911 and 1912 were traced to milk infected by typhoid bacillus carriers on dairy farms. It was realized that no amount of mere inspection and improvement in the sanitary condition of the dairies would protect against this danger. This and other considerations led to the present-day requirement of pasteurization.

Sometime before these outbreaks the milk industry had learned that by subjecting milk for a few seconds to a high temperature, its keeping qualities could be prolonged. Milk thus treated did not become sour. This device, spoken of as "flash pasteurization", quickly became

(Continued on Page 18)

How improvement in New York City's milk supply resulted in fewer deaths from diarrhea, once called cholera infantum.

Grain Cooperatives Unite On a Marketing Plan

THE most important news this summer is coming out of Washington, and has to do with the new Farm Board and its efforts to solve some of the farmer's problems. On the opposite page, we call your attention to the news story explaining the organization of the new Grain Corporation, formed by cooperative grain associations and elevators of the Middle West. It is important because it looks like a constructive step to solve the problem of marketing grain, and it is interesting because so many of these co-operatives which heretofore have been fighting one another, have come together on a common basis.

Maybe farmers can work together after all, when the need is great enough. How bad will dairy market conditions have to become before dairy cooperatives agree on a common selling plan?

The Health Department and Dairymen

WE are especially favored in this issue by the very interesting and instructive article on Page 3 on the relation between milk and public health by Dr. Shirley W. Wynne, health commissioner of New York City.

Sometimes the health regulations governing the production and sale of milk seem drastic and impractical to milk producers, and sometimes the milk and barn inspectors are not very tactful or sympathetic. Some of them may not know their job very well. But on the other hand, the improvement in the quality of milk sold in the New York City market has paid dairymen in dollars and cents, and infinitely more than this, is the satisfaction of knowing that the milk that you sell to New York City is the best in quality in the world, and a food that is safe and good for little children.

Of course, it is a Health Commissioner's first duty to look out for the interests of the people of his city. He is the consumers' representative. But we are especially pleased with Dr. Wynne's sympathetic attitude toward milk producers. For example, we have heard him express many times his belief that dairymen should be well paid for their product. He thinks that the way for the

city to get an adequate supply of high quality milk when it wants it is to pay farmers well for it.

Boy Scouts On World Jamboree

THIRTEEN hundred American boys, the pick of their several communities, are now on a trip to England on the greatest migration of youth in history. All thirteen hundred are Boy Scouts, chosen because of unusual qualifications, and all are attending the Third World Boy Scout Jamboree, a great event in Scouting, which is taking place at Birkenhead, England, July 31 to August 13. Over sixty thousand boys are in attendance. Not the least of the benefits secured from this great gathering is the lasting effect on the future good will of the world through the fraternizing influence of bringing all of these future world citizens together. There are nearly 2,000,000 Boy Scouts and leaders in the world, more than one-third of whom are in the United States.

The Boy Scout movement reaches into nearly every community in this country and there is scarcely a hamlet without its troop of boys. Interest in Scouting is increasing among farm boys through the opportunity they have to take part in Scouting by becoming Lone Scouts.

All of the work that is now being done for boys through such movements as the Boy Scouts and the 4-H Clubs will certainly have an untold effect on the future progress and happiness of mankind.

Dry Weather Injuring Crops

NOT in years have we had so much hot weather, and so little rain as there has been this summer. Although some sections have had more rain than others, in general the drought has been bad, not only in this country but in Europe. People everywhere, and especially the poor in the great cities, have been suffering intensely from the heat. What is more serious still, is the effect of the drought on crops. Potato growers on Long Island estimate that the dry weather has caused them at least a million dollars' damage up to the present time. Corn is suffering, foliage on the trees is turning brown in many parts of the East, and the pastures are drying up.

What a climate! Part of the year we shed all of the clothes the law will allow, and the rest of the time we put on all we can, and shovel coal in the bargain.

Feed Dealers Getting On a Cash Basis

"I believe I am safe in saying that the grain dealers in this section who went on a strictly cash basis of doing business have found it to be a successful method and are continuing this form of merchandising. There are several other dealers who changed their method of merchandising from what you might call a first price proposition to the following:

"Special price for cash.

"A cash discount for large lots of from one ton to five or more, charging interest after 30 days.

"Charging for deliveries, where dealers have a delivery system.

"It appears that the old form of merchandising, one price for everybody, was becoming obsolete. It seems fair to charge the farmer or consumer a price commensurate with the service he demands."

THE above statement was contained in a letter written to us by a leading Vermont feed dealer. The common sense facts expressed in this letter have our unqualified approval. How absolutely unfair it is for the farmer, or for anybody else, who always pays cash, to have to pay the same price as the man who never does. In the past, the whole tendency has been to discourage cash payments because the man who pays as he goes not only pays for his own product but he helps to carry the credit charges of the other fellow.

The place to buy credit is not at the feed deal-

er's, anyway. It is at the bank. That is what banks are for, and almost any bank will loan money to a good farmer if the farmer will take the trouble to visit the banker and give him confidentially all of the facts about his business.

The Farm News Written For Farmers

HAVE you noticed the live, up-to-the-minute, news articles that have been appearing in every issue of AMERICAN AGRICULTURIST this summer? We are making every effort to find out what is going on in the world, of special interest to you, and then boil it down, and write it in everyday language, so that you can read it quickly and easily. Where else except in the "Old Reliable" can you get this farm news service?

Beauty Spots of the East—Taughannock Falls

TRAVELERS along the road from Ithaca to Geneva can well afford to turn aside for a few moments near Trumansburg to see the highest falls east of the Rocky Mountains. They are pictured on our cover this time.

Just at the edge of Cayuga Lake this comparatively small stream takes a drop of 215 feet, which is 50 feet greater than Niagara Falls. The Finger Lakes region of New York State holds many spots of interest, but most of them can be easily missed. Before you take that auto tour which you are planning, write to the Conservation Department at Albany and ask for information and booklets concerning the State Parks in the section you plan to visit.

Maine Now Free of TB

THE State of Maine is to be congratulated as the first of the New England states and the second state in the Union to be declared free of bovine tuberculosis. North Carolina was the first, having been declared free of the disease on October 1, 1928. But Maine has really done a bigger job because she has more dairy cattle. Unlike New York and some of the other great dairy states, her problem was comparatively small because she had few cows that reacted to the test.

Naturally, Maine's clean cattle are sought for by the owners from all the other New England states and the fact that her cattle are now free from TB will do much to promote the whole dairy industry within her borders.

Connecticut is another New England state which is making very rapid progress in the fight against TB. The legislature made an especial emergency appropriation in February of this year and a total of nearly 32,000 animals were tested during March and April of this spring. This is a large number compared to the total in the state. About 2.1 per cent reacted to the tests.

Eastman's Chestnut

SOME time ago I was on a New York Central train on my way to give a talk at a farm meeting. There were two or three verses of poetry that I wanted to commit to memory to use in my talk and in trying to learn them, I said them out loud. Before I knew it, I was giving them rather emphatically and using my hands to emphasize certain passages. Suddenly I came to my senses and looked up to see about half of the people near me in the car staring at me and grinning.

The incident reminded me of the story of President and Mrs. Hadley of Yale University, who likewise were traveling on a train, and President Hadley made use of the time to rehearse a speech in a low voice that he was trying to learn. Suddenly a kindly matron who was sitting behind Mr. Hadley, and who had been watching and listening, leaned forward and tapped Mrs. Hadley on the shoulder and said meaningly:

"You have my sincere sympathy, my poor woman. I have one just like him at home!"

A New Cow Testing Plan for Every Dairy

How Any Dairyman Can Test With Little Work or Expense

EVERY good dairyman now knows the need of testing his cows for butterfat, weighing their milk and feed regularly, and keeping feed and production records. Every dairyman knows that finding even one cow that does not pay for her keep will more than pay for the cost of testing the whole dairy. It is true, also, that production records always increase the interest of the farmer himself, and of his boys, in the dairy, and lead to greater efforts to make every cow pay.

The trouble with cow testing is, however, to get the time to do it. Many start keeping records, but few finish. It goes well for a time, and then there comes a period when everybody is extra busy, and the testing and record-keeping get neglected. The Dairy Demonstration Associations have done and are doing a splendid work. The records which have been secured through these cow testing associations have led to better production, with almost every man who is a member.

But even these associations have their disadvantages. One of them is that the farmer himself does not do the weighing and testing of the milk or feed, neither does he keep the records. Therefore, he does not get as much out of it as he would if he did it himself. Then there is the difficulty of getting a good tester, and after he is secured, many farmers' wives object to boarding him one day a month, when he comes to do the testing.

All of these difficulties have been overcome by a new plan of testing which we think is destined to sweep through the dairy districts, and in time to include most good dairy farmers. This plan meets the need of the small dairy farmer in sections that are not now served by dairy herd improvement associations. The plan is not a theory, but already is working successfully in several New York counties.

How the New Cow Testing Club Plan Works

Each dairyman takes the weights of milk and grain, and a sample of milk from each cow one day a month. He is furnished a blank barn-record sheet, on which he records for one day each month the following:

The name of each cow in his herd.

The pounds of milk for night and morning milking one day a month for each cow.

The pounds of grain fed per cow for one day (for dry cows as well as for those milking).

The freshening, dry, and breeding dates, and reasons for sale of cows, sickness, etc.

The kind of roughages, the grain mixture, and the price per ton of the grain.

Dairymen will be notified each month when to take the weights and samples.

Samples and barn records are sent to the local milk plant, or to a central testing laboratory.

The Club will arrange for each dairyman to receive his herd record each month with the following data:

Pounds of milk per cow for the month, and to date.

Pounds of butterfat per cow for the month and to date.

Pounds of grain per cow for the month and to date.

The average production (milk and butterfat) each month for his herd, and the average production for the club.

Pounds of grain per 100 pounds of milk for his herd and for the club.

A letter will be enclosed with the report each month which gives feeding and management information and interesting notes about the experiences of the members in the club.

A summary of his herd will be given each dairyman at the end of the year.

A loose-leaf book will be furnished

for filing the monthly and yearly summaries during the year.

The herd summaries will be discussed with each dairyman at the end of the year, either in groups or by personal visits to each farm. This follow-up should enable the dairyman to make changes in practices which the testing and records show should be made.

Advantages of the Dairy Record Plan

It permits more dairymen to keep records at lower costs.

Dairymen get more from the records

because they do part of the work themselves.

The womenfolks do not have to board the tester each month.

Members from any part of the county can join at any time.

The specialists' interpretation of the records at the end of the year enables the dairymen to change, with confidence, their methods of feeding and management.

The letter to the members each month gives the county agent the opportunity to emphasize such projects as bull pens, better bulls, culling, abor-

tion control, and better and more home grown grains.

It helps the county agent to reach more dairymen with a definite worthwhile service.

Cost of the Dairy Record Club

The cost of testing under this plan will vary according to the number of cows enrolled, and according to the conditions under which the plan is set up in the county. The cost will range between \$1.25 and \$1.75 per cow per year. If you are interested, telephone or write your county agricultural agent immediately.

A New Grain Marketing Organization

Federal Farm Board Helps Form Farmers' National Grain Corporation

AT a two-day meeting of the Federal Farm Board with 52 representatives of a number of cooperative grain marketing organizations, a plan was effected to organize a grain stabilization corporation to be known as the Farmers' National Grain Corporation. An organization committee of 16 was selected who will meet on August 26, at Chicago, to start the task of getting the new corporation into operation. The organization committee is made up as follows:

William Settle of Indianapolis, Ind., chairman of Central States pool, Indianapolis, Ind.—Chairman.

L. E. Webb of Jetmore (Kan.) Farmers' Cooperative Commission Company of Hutchinson and Wichita, Kan.—Secretary.

George Duis of Grand Forks, N. D., Northwest pool.

Ernest Downey of Wichita, Kan., and John Manley of Enid, Okla., Southwest pool.

M. W. Thatcher of St. Paul, Minn., and H. G. Kenney of Omaha, Farmers' Union commission agencies.

S. J. Cottingham of Stanhope, Iowa—National Farmers' Elevators' Grain Company.

E. M. McColum of Indianapolis, Ind., Ohio, Indiana and Michigan Farmers' Elevator Association.

Lawrence Farlow of Bloomington, Ill., Iowa Farmers' Elevator Association.

F. H. Sloan, Sioux Falls, S. D., and P. E. Lee of Grand Forks, N. D., Montana, North Dakota, Minnesota, South Dakota Farmers' Elevator Association.

S. H. Thompson of Chicago, the American Farm Bureau Federation.

L. J. Tabor of Columbus, Ohio, National Grange.

C. D. Huff of Salina, Kan., the National Farmers' Union.

J. J. Knight of Kansas City, Mo., Farmers' Equity Union.

Much satisfaction is expressed by those interested in grain marketing. For example, Mr. William H. Settle, president of the Indiana Farm Bureau Federation said, "The prospects look good for the formation of a corporation through which farmers will get control of the marketing of their own product. It will make marketing orderly, systematic, prevent gluts and will go a long ways toward stabilizing the price of grain. This is what we have been dreaming for years, united action, and it's the first time it has been realized."

What the New Corporation Will Do

In brief, the Farmers' National Grain Corporation might be called a merger of various cooperative grain marketing organizations for the marketing of grain. The Corporation will be formed by the farmers' organizations and will be managed and operated by them. The new organization will act as an intermediary between the Federal Farm Board and the various cooperative marketing bodies and will start out with a capital of \$10,000,000 made up of shares of stock at \$20. a share which will be open to subscription by farmer-owned organizations on the basis of one share for each farmer member.

There will be fifteen directors representing the various grain growing regions and cooperative groups. The board of directors will pick an executive committee of five from their own membership. The corporation will be organized along cooperative lines so that it will be eligible for loans under the new agricultural marketing act.

The following are the purposes for which this corporation is to be formed:

1. To conduct stabilization operations on the open market, if and when such operations have been approved in advance by the Federal Farm Board.

2. To buy grain from member stockholders and to sell such grain for its own account.

3. To conduct educational work among farmers concerning the value of cooperative marketing and economical production.

4. To lease, purchase or construct necessary storage and other facilities.

5. To lend money to existing farmer-owned cooperative elevator associations for the purpose of building elevators or other physical facilities.

6. To make loans to farmer-owned companies for the purpose of financing and marketing crops from farm to market. It is pointed out here that no loans are to be made which would encourage competition between cooperatives.

The Farmers' National Grain Corporation will charge the usual commission fees for service to its stockholders,

(Continued on Page 6)

My Favorite Poem

MAY we again call your attention to the fact that we would be glad to have you send in your favorite poem, and those poems which get the most votes will be published in AMERICAN AGRICULTURIST and broadcast from WGY, the General Electric Company's station at Schenectady.

Tune in on this station every Thursday at noon and listen to the radio talk prepared by E. R. Eastman, editor of AMERICAN AGRICULTURIST, entitled "Visits with the Poets of the Farm and Home", and then send us your favorite poem.

The poem given on this page was sent in by Mrs. L. G. Perkins of Pittsford, Vermont, who states that it is one of her favorites. She also makes an interesting comment as follows: "I have not yet reached the place in life where my favorite poems are of despair, trials, or the comfortable rewards we will get later."

If

By RUDYARD KIPLING

If you can keep your head when all about you
Are losing theirs and blaming it on you;
If you can trust yourself when all men doubt you,
But make allowance for their doubting too;
If you can wait and not be tired by waiting,
Or, being lied about, don't deal in lies,
Or being hated, don't give way to hating,
And yet don't look too good, nor talk too wise;

If you can dream—and not make dreams your master;
If you can think—and not make thoughts your aim,
If you can meet with Triumph and Disaster
And treat those two impostors just the same;
If you can bear to hear the truth you've spoken
Twisted by knaves to make a trap for fools,
Or watch the things you gave your life to, broken,
And stoop and build 'em up with worn-out tools;

If you can make one heap of all your winnings
And risk it on one turn of pitch-and-toss,
And lose, and start again at your beginnings,
And never breathe a word about your loss;
If you can force your heart and nerve and sinew
To serve your turn long after they are gone,
And so hold on when there is nothing in you
Except the Will which says to them: "Hold on!"

If you can talk with crowds and keep your virtue,
Or walk with Kings—nor lose the common touch,
If neither foes nor loving friends can hurt you,
If all men count with you, but none too much;
If you can fill the unforgiving minute
With sixty seconds' worth of distance ran,
Yours is the Earth and everything that's in it,
And—which is more—you'll be a Man, my son!

A.A.'s Western New York Farm and Home Talk

A Million Dollar Rain

At last the prolonged drouth in western New York has been broken by a good rain in which from 1½ to 2 inches of water fell. "The Million Dollar Rain" as folk hereabouts have

By M. C. BURRITT

There has been much sweating in the

hay mow and much inclination to sit on the front porch and cool off. Frequent swims in the lake have been in order and yet every time we spend a half day in the city we come home to the farm thankful that we live in the country away from hot pavements, houses close together and crowds of folks. The green trees, the open spaces and the big front porch overlooking the wide shaded lawns always seem cool and inviting.—Hilton, N. Y., July 28, 1929.

M. C. Burritt

ing. Here and there a thunder shower helped, but these were comparatively light and spotted. We had one here on June 28.

The extent of the losses from this drouth are not yet fully realized, for the rain came too late to save many crops. The loss now most apparent is in spring grain, which has headed out very short and which cannot yield much more than half a crop. While the rather poor wheat crop was probably damaged more by the excessive rains of April, the dry weather during heading and filling no doubt is partly responsible for the small yield. The wet April made the hay crop which has not been very much affected by the drouth. Harvest weather was almost ideal.

Cultivated Crops Suffer Most

Lack of rain is most apparent in cultivated crops in the many poor stands of these crops and their more or less stunted condition. This effect is, of course, greatest on the late plowed fields. Early plowing and frequent working to conserve moisture enabled farmers who practiced it, to get good stands of cultivated crops because they had saved the moisture. I should say that more than half of the fields of beans, corn and cabbage show this spotted condition due to failure of seed to grow or plants to live. And everywhere beans are beginning to bloom with about half the normal vines and corn and cabbage are backward. But the rain has come in time to save these crops where the stands are good.

Another serious effect of the drouth in this section has been the affording of a very favorable condition for the development of aphids on apples and psylla on pears. Whereas, heavy rains would have more or less washed them off and helped to hold them in check, these pests have done serious damage to foliage and where the right spray or dust treatment has not been given have severely affected the fruit. Green aphids have followed the rosy aphids in such numbers as to call for special treatment with tobacco again. Not only have they covered the growing tips and new suckers but in many cases the apple clusters and leaves, making fruits sticky and dirty. In the case of pears the crop is so light that many have thought it not worth spraying and the damage by psylla will be heavy.

Berry Crop Short

The raspberry crop has been practically cut in two by the dry weather, the rain having come too late to save it. Lawns are brown. Cisterns and wells were low and some have had to draw water. But now the rain has brought a new lease of life and encouragement. The green is already coming back in the lawns, second cutting alfalfa is growing apace and cabbage is fairly jumping. This rain means money in our pockets and encouragement in our hearts. It is literally worth a million dollars to western New York.

July has been a very warm month.

Many Orchards On Unfavorable Soil

It has been stated that many western New York orchards are suffering more from lack of soil fertility than from any other cause. What is your opinion on this problem?—I.R.D., New York.

Recent surveys have shown that many western New York orchards are located on soil which is not adapted to fruit growing. It appears to be a losing proposition to try to carry such orchards along. The best way would be to get out of the game as soon as possible and either grow other crops or plant orchards on soil that is suitable.

Where soil is suitable it is comparatively easy to maintain fertility to the proper point.

McIntosh Becoming More Popular

What are the chances that the McIntosh will be over-planted or that they will lose their popularity?—R.E.E., New York.

There seems to be a definite trend toward fewer varieties and it seems probable that the McIntosh will be one of those that will increase in popularity as it becomes better known. It has the quality and most growers believe that there is little danger of over-planting for years.

A New Grain Marketing Organization

(Continued from Page 5)

which fees are to be used; first, to pay dividends on capital stock not to exceed 8 per cent and after this the money will be distributed to member stockholders as patronage dividends. These patronage dividends will be paid in the form of stock in the National Grain Corporation until the capital stock of the company equals \$20,000,000.

The general attitude of those who have commented on the formation of this new corporation, is that the Farm Board had achieved a triumph in bringing together for unanimous action a number of organizations which have been in disagreement for years. On the other hand, it has been claimed by some that while the new corporation is a step in the right direction, that it can do little or nothing to raise basic price levels on grain. According to one authority, the statement frequently made that 35 to 40 per cent of the grain is handled cooperatively is only partly true and may be misleading. As much as 35 to 40 per cent of the grain marketed may be handled cooperatively at some point along the road to market, but it is claimed that only about 8 per cent of the total is handled cooperatively in terminal markets. While there has been some progress in tying together many local farmer-owned elevators into chains or groups each having a sales agent, there has been no unity of action on a large scale. In fact, the actions of various groups have frequently been antagonistic to each other.

FARM SUPPLIES - Information About Them

We frequently get letters from subscribers who ask where they can buy certain equipment or supplies. It is good business when you are in the market to get all the information possible before buying. Consequently, we have made arrangements to forward to you, information, catalogues and prices on such equipment or supplies as you may need.

In taking advantage of this service you are under no obligation either to us or to the manufacturer. Just clip this coupon, mark the items in which you are interested and mail to us.

FARMERS BUY FROM FARMERS

Let us suggest to you as breeders the best kind of a
pig to start to raise is a good one. You save time and
money. We sell all pigs with a trial of two weeks, and
then if dissatisfied, return pigs and we will return
your money.

6-7 wks. old, \$4.25 ea.; 8-10 wks. old, \$4.50 ea.
Breeds—Chester and Yorkshire cross, and Berkshire and
Chester cross. Crating free. These prices F.O.B. our
depot. Will ship any number C.O.D. or send check or
money order.

MISHAWUN STOCK FARM,
MISHAWUN ROAD, WOBURN, MASS.
P. S. No pigs sold at the farm; only by appointment.

RELIABLE PIGS FOR SALE

Buy where quality is never sacrificed for quantity. We
sell only high grade stock from large type Boars and
Sows, thrifty and rugged, having size and breeding.
Will ship any amount C.O.D.

Chester & Yorkshire — Berkshire & Chester
7 TO 8 WEEKS OLD \$4.25
8 TO 10 WEEKS OLD \$4.50

Also a few Chester barrows 8 wks. old, \$5.00 each
Satisfaction guaranteed or money refunded. 10 days
trial allowed. Crates supplied free. A. M. LUX, 206
Washington St., Woburn, Mass. Tel. Wob. 1415.

PIGS FOR SALE OLD RELIABLE STOCK

Heavy-legged, square-backed Berkshire and Chester
crossed, and Yorkshire and Poland China crossed.
Barrows, boars and sows—8-10 weeks old, \$4.75 each.
Also, Chester Whites and Poland China and Durocs
from registered Boars—7-8 weeks old, \$6.00 each. We
ship sows and unrelated boars for breeding. They are
the kind that make large hogs. Shipped C.O.D. No
charge for crates. If dissatisfied, return pigs and I will
return your money. Yours for quality hogs.

ED. COLLINS, 35 Waltham Street,
Tel. 0839-R LEXINGTON, MASS.

Post Your Farm
And Keep Trespassers Off

We have had some new signs
made up of extra heavy material
because severe storms will tear and
otherwise make useless a lighter
constructed material. We unre-
servedly advise farmers to post
their land and the notices we have
prepared comply in all respects with
the laws of New York, New Jersey
and Pennsylvania. The price to
subscribers is 95 cents a dozen, the
same rate applying to larger quan-
tities. Cash must accompany order.

American Agriculturist
461 Fourth Avenue. New York

The Question Box

Growing Brussel Sprouts

Will you kindly send me information
on the care of Brussel Sprouts? I have
several plants in the garden and this is
the first time I have ever had them. I
would like to know how they should be
treated while in the garden, especially
about breaking off the leaves, also how
they are stored for the winter.—S.G.

I DO not believe that it is advisable
to remove the leaves of brussel
sprout plants, at least not until they
dry down. The leaves are essential
to the manufacture of plant material
and so for the development of good
sprouts.

Brussel sprout plants are not stored
for any considerable length of time.
The plants may be taken up and kept
in a cool barn or cellar where they will
not to be subjected to severe freezing.
The sprouts may then be taken off as
is convenient. The season, in this way,
can be prolonged for several weeks.

Lime for Potatoes

"I was interested in the recent article
on the use of lime. I am following a three
year rotation of potatoes, oats and grass
or clover on a yellow sand loam and
gravel soil. The ground is well manured
and fertilized (having grown 350 bushels
of potatoes per acre) but on the lightest
soil the clover does not grow. If I put on
lime will it cause scab on the potatoes?"

SOIL which is heavily supplied with
lime is more favorable for the de-
velopment of scab than a soil which
lacks lime. At the same time clover
will not grow well on a soil lacking in
lime. With a rotation such as you
have, we believe it will be possible to
add lime in sufficient amounts to al-
low you to grow clover without ser-
iously affecting the amount of scab
which you have.

We would add the lime in the rota-
tion when the grass is seeded and when
the time comes to plant potatoes we
do not believe that scab will bother
you very much. In specialized potato-
growing sections where potatoes are
grown year after year, growers have
found it necessary to keep the soil ac-
idity at a particular point if they are
going to get away from the trouble of
scab. They of course, are not concern-
ed about the growing of clover.

Powdered Milk for Calves

Can you tell me how to feed small
calves powdered skim milk. Could you
tell me how much to feed and how much
to increase the feeding.—W.E.K., Penn-
sylvania.

POWDERED skim milk can be used
as a substitute for fresh skim milk
by mixing one pound of powdered skim
milk and nine pounds of water.

This can be fed at the rate of one
pound to each 10 pounds of live weight
of the animal until you are feeding 16
pounds after which it is not necessary
to increase the amount as the calf can
get the proper nourishment from grain
and roughage.

Controlling the Mexican
Bean Beetle

The Mexican bean beetle is getting to
be quite a pest here and we are writing
for information as to the best means of
control.

THE bean beetle was first found in
New York State in Erie County in
1927. At present it is numerous in sev-
eral western New York counties as
well as a good share of the State of
Pennsylvania and parts of New Jersey.

The adult beetle is rather light in
color with a number of black spots on
the back and the larvae have the
appearance of small worms which are
rather fuzzy. The Mexican bean bee-
tle eats the underside of the leaves
which gives them a sort of lacy appear-
ance.

The insect has biting mouth parts
and therefore must be controlled by
poisoning. Some arsenicals cause in-
jury to beans and so either magnesium
arsenate or calcium arsenate is recom-

mended. Magnesium arsenate is mix-
ed up at the rate of 2 pounds to 100
gallons or for small areas, five level
tablespoonfuls to a gallon of water.
Calcium arsenate is mixed at the rate
of 1½ pounds of calcium arsenate, 3
pounds hydrated lime and 100 gallons
of water or for small areas 4 level ta-
blespoonfuls of calcium arsenate, 7 le-
vel tablespoonfuls of hydrated lime to
3 gallons of water.

Because the beetle eats the under-
sides of the leaves it is important that
the spray hits the underside. With a
high pressure sprayer there is a tend-
ency for the spray to form a fog which
covers both the upper and undersides
fairly well, but in addition, spray noz-
zles should be so arranged so that they
point upward from a point near the
ground and direct the spray to the
undersides of the leaves.

The New York State Agricultural
Experiment Station at Geneva, in co-
operation with the U. S. Department
of Agriculture, has been studying this
insect and has published circular 96
on the control of this beetle. This cir-
cular will be sent to anyone on request.

Chicken Manure for
Vegetables

Kindly tell me for what vegetables is
chicken manure the best. I have one acre
lima beans, sweet corn, tomatoes, cab-
bage, cauliflower.—V. T., N. Y.

POULTRY manure is excellent for
any kind of vegetables. It is consid-
erably more valuable per ton than other
forms of manure and for this reason
you will get best results if you do not
apply it too heavily. Our suggestion
would be that you put it on the crops
which you believe will return you the
most money and in this way we think
you will get greatest returns. If it
must be stored for any length of time,
keep it dry to prevent loss of plant
food.

Controlling Horseradish

I recently saw a cartoon in A.A. about
quack grass and it has reminded me to
write and ask if you can tell me any
way to kill, destroy or otherwise get rid
of horseradish which is a pest on my
small farm.—M.B.K., New York.

THERE are a few principles which
govern the eradication of all weeds.
Some of these are more important
than others in a particular case but
an understanding of them will help.

Any plant must grow leaves in or-
der to live since these leaves manufac-
ture starch which is necessary to the
plant's growth. It follows therefore
that any weed can be killed if top
growth is absolutely prevented. Due
to the fact that so much food is stored
in horseradish roots it takes longer to
kill them than some other plants.

About the only other way of con-
trolling the weed is to dig it out en-
tirely, pulling it up and burning it.
Any method of control of horseradish
requires considerable time and per-
severance but we have known of a few
cases where the efforts have been suc-
cessful. We will be glad to have our
readers give us their experience with
this weed.

Early Pullets May Molt

Is there a danger that pullets hatched
in January will molt the following fall?

IT is almost certain that January
hatched pullets will go through a
molt in the fall just about the same
as old hens. However, this may not
be a serious objection. In the first
place, the January hatched cockerels
will provide early broilers which will
sell at a good price. In the second
place, the pullets will come into pro-
duction during the summer when the
price of eggs is usually good. The fall
molt will lessen production for a time
but even at that, there will be a good
chance for profit before and after this
molt.

A
UNADILLA
will save your corn

Make the most out of your corn crop
by storing it in a Unadilla. If your
corn reaches maturity—ensile it in a
Unadilla. If it doesn't mature, if it
freezes or becomes infected with corn
borers, ensile it in a Unadilla—a sure
death to this pest—a safe and
sure insurance on your crops.

Unadilla ensiled corn is the
best winter milk producing
feed. It is succulent and
highly economical.
Don't wait! Order your
Unadilla now and be sure
of your crops. We guaran-
tee immediate shipment
on any size silo in Oregon
Fir or Spruce. Absolutely
dry, best quality mat-
erials obtainable.

Reviewing the Latest Eastern Markets

Milk Prices

The following are the August prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Market Holds Steady

CREAMERY SALTED	Aug. 1, 1929	July 25, 1929	Last Year
Higher than extra	44 -44½	44 -44½	45¾-46¼
Extra (92sc)	43½	43½	45¼
44-91 score	39 -43	39 -43	42½-44¾
Lower G'ds	38 -38¾	38 -38¾	40 -42

Although our last report stated that a feeling was apparent in the butter market that the price could not hold steady at the prices quoted, the market on Saturday, July 27, was even stronger. This was apparently due to some outside speculation, some shrinkage in receipts and reports of further falling off in production due chiefly to the dry weather. On Monday the feeling was a little uncertain until word

was received of a half cent advance at Chicago which bolstered up the sentiment.

The situation eased up a bit and on Tuesday the market was not quite as steady as it was the previous day. On Wednesday further news of strength in the Chicago market arrived where there was an advance of one half cent, and news that the make was shrinking also tends to strengthen the market.

Butter is still going into storage at the rate of one million pounds a week in the Metropolitan district. In view of the heavy butter in storage dealers are afraid of an advance in prices which might be reflected in retail prices and in a reduction in consumption.

Cheese

STATE FLATS	Aug. 1, 1929	July 25, 1929	Last Year
Fresh Fancy	22½-24½	23 -25	25 -26
Fresh Av'ge			23 -24
Held Fancy	27½-29	27½-29½	
Held Av'ge			

The cheese market has been rather tame with little of interest to report. On Monday, July 29, the market showed a slightly easier tone, and outside quotations were seldom reached. On Tuesday the market steadied somewhat although it was still easy to buy fancy Daisies as low as 22c. On July 31 the demand for June cheese showed some improvement. Advices from the West indicated that the situation there was somewhat stronger and there was also talk that there might be a small advance on the Plymouth market.

Eggs

NEARBY WHITE	Aug. 1, 1929	July 25, 1929	Last Year
Hennery			44-47
Selected Extras	43 -47	47 -50	41-43
Average Extras	40 -42	44 -46	36-39
Extra Firsts	37 -39	38 -42	33-35
Firsts	34 -36	35 -37	32-36
Undergrades	33 -	33 -34	
Pullets			25-26
Pewees	22 -28	22 -29	
NEARBY BROWNS			
Hennery	38 -44	39 -46	39-42
Gathered	33 -37½	33½-37½	31-38

Eggs are down below last week's quotations, although, if we were to hazard a guess, it would be that the condition is only temporary. The receipts of New York city continued to run a little heavier than last year and the hot weather is having its effect in lowering the demand. There is a tendency on the part of receivers to dispose of eggs rather than to store them due in part to the hot weather which naturally has its effect on a large proportion of the eggs arriving. Retailers were slower to reduce prices following retail advances of the previous week and as a result the wholesale market is not getting the advantage of increased consumption which might come with lower prices.

Poultry

FOWLS	Aug. 1, 1929	July 25, 1929	Last Year
Colored	29-31	-32	27-28
Leghorn	25-29	26-30	22-24
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	22-29	29-35	25-38
Leghorn	24-26	23-28	25-31
CAPONS			
TURKEYS	20-30	20-35	
DUCKS, Nearby	-22	20-25	19-23
GESE	-15	13-15	

The market on fowls by freight is in good shape and prices were well maintained on July 31. The situation on broilers is somewhat different. The market is holding up well on fancy stock, with good heavy broilers selling at 29c, with the very best bringing a small premium, but inferior grades are selling poorly. Colored fowls arriving by express are selling at the same price as those arriving by freight. Leghorn broilers are rather poor and sell for low prices. The demand on express broilers is excellent for fancy Rocks, Reds and Leghorns, although inferior grades are hard to dispose of.

Fruits

There has been a good supply of apples from New Jersey and the Hudson Valley, and the market on July 31 was rather irregular. Only the best well graded varieties reached top quotations. Duchess was quoted at \$2 to \$2.50 for the best and \$1.25 to \$1.75

for lower grades. Yellow Transparent brought \$2.25 to \$2.50 for the best and \$1 to \$2 for the poorer grades. Wealthies brought \$2.25 to \$2.75 for fancy and \$1.25 to \$2 for lower grades.

lett pears from the Hudson Valley. let pears from the Hudson Valley. Clapps brought \$2.00 to \$2.75 for fancy and Barletts brought \$2.50 to \$3.00.

Peaches from New Jersey were quoted at 50c to \$1.25 per basket.

There was a fair supply of blackberries on the market. Many of them were small and poor in quality and sold around 10c to 15c. A few from the Hudson Valley brought 20c.

Raspberries from nearby points brought 10c to 18c. Fancy large huckleberries are rather scarce and poor offerings were cleaned up with difficulty. Cultivated huckleberries from New Jersey brought 40c to 50c per quart with wild at 15c to 30c.

Vegetables

Cabbage has been selling well. Arivals from nearby have been selling from \$2 to \$2.50 for white and \$2.50 to \$3 for red.

Celery has been meeting a small demand, although top quotations have been reached. New York State arrivals has been ranging from 75c to \$2.50 per 2/3 crate. New Jersey celery brought 75c to \$1.50 per ½ crate and \$1 to \$2.50 per 2/3 crate.

There has been a small demand for sweet corn and the market is weak.

Lettuce is also dull.

Feeds and Grains

FUTURES	Aug. 2, 1929	1929	Last Year
(At Chicago)

Gluten Meal	48.00	38.00	54.75
36% C. S. Meal	42.50	42.50	44.00
41% C. S. Meal	45.50	45.50	51.00
43% C. S. Meal	48.50	48.50	53.00
34% O. P. Linseed Meal	55.00	56.00	51.00

The above quotations, taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

The grain market has been an up and down affair. Prices would improve and then speculators would take their profits and the result would be a slight drop again. Reports of dry weather continue to come and as a result prices are continually tending upward. Wheat is 50c a bushel more than it was around a month ago and other grains have also gone up in price, due both to sympathy with the wheat market and because of reduced production, caused by the dry weather.

Hay

Although receipts of hay at New York have been light, supplies at all points are in excess of the demand. The market has been low and irregular. Quotations were omitted entirely on No. 1 timothy and quotations on No. 2 were \$21 to \$23 for small bales and \$24 to \$25 for large bales. No. 3 and poor were down as low as \$13. Rye straw is \$21 to \$22 per ton.

Potatoes

This week shows another slight improvement in the market on potatoes. Receipts from Long Island and New Jersey have been slightly lighter. Long Islands are quoted on August 1 at \$5 to \$5.25 per barrel and \$4.25 to \$4.50 per 150 lb. sack. Whereas, last week New Jerseys were quoted at \$4. to \$4.50 per 150 lb. sack, this week they are quoted at \$5. for No. 1's.

The feeling that there will be a light crop seems to be increasing as time

goes on without sufficient rainfall to bring the crop along. Suffolk County estimates the loss of \$1,000,000 in its crop, whereas New Jersey reports its loss to farmers at \$3,000,000.

Trend of the Farm Markets

Special to American Agriculturist from the Bureau of Agricultural Economics, U. S. Dept. of Agriculture.

Washington, D. C.—Many kinds of farm products advanced in July, but there were some losses at the end. Grain still tended upward. Live stock was holding fairly well. Potatoes were recovering from the mid-month decline. Dairy products and eggs were holding their price position easily under decreasing supply. Summer fruit sells at prices usually favorable to producers. Crop prospects continue fair to good, although midsummer drought is causing serious injury.

Many of the late or main-crop potato States are getting under way, but combined shipments are lighter than a year ago. At shipping points in New Jersey, Cobblers held firm in late July around \$2.65 per 100 pounds, and this stock was higher in New York City at \$2.65 to \$2.85.

The onion shipping season has opened in New York State. Iowa's output increased. In the Connecticut Valley of Massachusetts, the Japanese Sets are returning \$2.50 sacked per 100 pounds, with the market firm. Crates of imported stock sold mostly at \$1.65 to \$2.25.

Reports of a sharp decrease in the make of butter due to the hot weather which has prevailed throughout most of the producing sections was in a measure responsible for the firmer position of the markets around August 1. The large surplus in cold-storage as compared with a year ago, is the most unfavorable feature.

If there was any change in the cheese market in late July, it was in the direction of a firmer market. But at no time was there active trading as buyers did not care to anticipate needs and confined their operations mostly to small lots. Canadian cheese sold slightly lower.

The egg market shows greater strength on most grades near August 1. Reports indicate considerably trading and freer use of storage eggs, some of which show a profit. Qualities have been running somewhat irregular on fresh supplies. Receipts are running heavier than last year and into storage movement lighter, which would seem to be a favorable feature, suggesting active movement into-consumption.

The grains with the exception of barley, advanced somewhat with wheat. The corn market showed some independent strength, despite the fairly favorable crop prospects. The limited offerings of corn were meeting a moderately active demand. Oats were firm with wheat and corn, but barley averaged lower with slow demand.

The higher grain prices were a strengthening factor in mill-feeds. However, the rapidly advancing feed prices have tended to curtail the demand at some markets. Wheatfeeds, cottonseed cake and meal advanced more sharply than other feeds.

A new top for the year, \$16.75, was hung up at Chicago in the fat steer trade near the end of July, long-fed heavy bullocks, grading strictly choice, commanding that figure.

Good and choice hogs weighing under 200 pounds, together with pigs, were virtually immune to the declines which were general at Chicago in late July and especially in heavy hogs, both in the butcher and packing classifications. Recent top at Chicago was \$12.30, paid for choice 190 pound averages.

Larger receipts and an unsatisfactory dressed lamb market were held responsible for sharp price breaks on fat lambs, which closed the month at Chicago on a basis of \$1.25 to \$1.50 lower than a week earlier.

CHEVROLET

THE Chevrolet Six offers, at amazing low prices, those qualities of performance, economy and dependability so essential in a car for rural use!

The big valve-in-head engine of advanced design assures six-cylinder power for heavy roads and steep hills, six-cylinder speed and acceleration for enjoyable driving on the open highways or in traffic—and six-cylinder smoothness that enables you to travel at every speed without annoying vibration or body rumble... all combined with an economy of better than twenty miles to the gallon of gasoline.

CHEVROLET MOTOR COMPANY, DETROIT, MICHIGAN
Division of General Motors Corporation

In its many provisions for comfort, luxury and smartness, the Chevrolet Six is equally outstanding. Chevrolet bodies are Fisher Bodies and are offered in a wide variety of colors at no extra cost. Built of selected hardwood and steel, unusually roomy and tastefully upholstered in long wearing materials—they constitute a further advantage that cannot be enjoyed in any other low-priced automobile.

Visit your Chevrolet dealer. Be sure to see and drive this remarkable six-cylinder car—and remember, it actually sells in the price range of the four!

A SIX IN THE PRICE RANGE OF THE FOUR

When You Meet an Oldsmobile Owner You Meet a Friend of Oldsmobile

The high regard Oldsmobile owners have for their cars is significant of the deep and enduring satisfaction this fine car of low price gives in daily use. In the past few weeks alone, hundreds of owners have written to Olds Motor Works, voluntarily expressing their enthusiastic praise of Oldsmobile.

Talk with owners. Find out how their enthusiasm continues to grow, month after month, as Oldsmobile demonstrates its ability and reliability under all conditions.

Then come and drive the car yourself.

Learn through personal experience not only what this Oldsmobile can do, but how it does it.

Drive it through traffic. Brilliant getaway and remarkable handling ease give you the lead at the signal change and enable you to take full advantage of every opening. Fingertip steering and a short turning radius make parking easy, even in small spaces. Try it on the open highway. Oldsmobile's big 62-horsepower high-compression engine provides swift, sure acceleration—speed for any emergency

—power for any need. Comfortable deep cushioned seats and four Lovejoy hydraulic shock absorbers assure restful riding ease.

After you have inspected and driven this finer Oldsmobile, you will know that it is a truly remarkable car. After you have compared it with its field, you will appreciate that it is an outstanding value. And after you have listened to owner after owner, you will realize that whenever you meet an Oldsmobile owner, you meet a friend of Oldsmobile.

Farm News from New York

Samuel McKelvie of Nebraska Gets Last Place on Farm Board

PRESIDENT HOOVER has just announced the appointment of the eighth and last member of the Federal Farm Board. This is Mr. Samuel McKelvie, publisher of the Nebraska Farmer, a Standard Farm Paper, and former governor of Nebraska. It is stated that this appointment was offered to Mr. McKelvie some time ago, but at that time he felt he could not accept and now he has accepted with the reservation that it may be necessary for him to withdraw at the end of a year.

Mr. McKelvie will represent the wheat growers. He has been recognized for several years as one of the leading farm spokesmen of the middle grain states. He has always been an opponent of farm subsidy.

Legge Talks at Institute of Cooperation

Acting as representatives of the Federal Farm Board, Secretary of Agriculture Arthur Hyde and Chairman Alexander Legge, recently attended the meeting of the American Institute of Cooperation at Louisiana State University. Mr. Legge, in his talk, outlined at some length the probable activities of the Federal Farm Board. He stated that the major policy of the Federal Farm Board will be the expansion and strengthening of the cooperative movement. He made it clear that the government does not intend to supplant any of the existing cooperative agencies nor does the Federal Farm Board intend to buy or sell any commodity, agricultural or otherwise. Mr. Legge urged that those attending the session should study the law so they may have a better understanding of what it is expected to do.

"There are many people," said he, "who think that the board's activities should be directed to arbitrarily raising the price level for agricultural products. The Board cannot raise prices arbitrarily. Prices, as has been said many times, are determined by basic economic conditions. What the Board does is to assist farmers to become

better able to compete with other groups in the markets of the nation and the world.

"In conclusion I wish to say that the farmers and the public must be patient. The problems of agriculture are of long standing and cannot be solved overnight. On the contrary, there is always present the danger of increasing and aggravating our difficulties by unwise and premature action. I wish to assure you that the Federal Farm Board will move as quickly as is consistent with the assured and permanent improvement of agriculture. At the same time, the board will not undertake to force its program on any group of people.

"It will move only as fast as the farmers through their organizations are able and willing to accept the program. The improvement of agricultural conditions must be based on self-help. The board can contribute largely and will contribute to such improvement. In the long run, however, the board will render the greatest service to agriculture and to the nation by helping the farmer to help himself."

Wheat Crop Estimates Cut

WHEAT prices at present are very unstable due primarily to conflicting reports from grain producing sections. Early this year, the heavy carry-over of wheat both in Canada and the United States, together with favorable crop reports brought prices down to a low level. The principal cause of the recent sensational rise has been exceedingly dry weather both in the northwest United States and Canada, which has seriously affected the spring wheat crop. Some reports indicate that Canada's crop will be only a little more than half of normal and reports from the four principal spring wheat-producing states in this country, indicate a crop smaller than last year. The equally as bad. At the same time, reports from other wheat-producing countries indicate a crop smaller than last year. The U. S. crop report of July 1, which was put out before much of the present damage became apparent, put the estimate of the United States production of spring and winter wheat at 833,869,000 as com-

pared with 902,749,000, last year and the total production of nine wheat-producing countries as 1,432,438,000 as compared with 1,529,127,000 in 1928. As already stated the drouth has seriously damaged the crops and the final yield is a matter of conjecture. Some authorities state that rain at this time will still be of help to the spring wheat crop.

The drouth is also causing heavy losses to farm crops in the East. It has been estimated that the New Jersey potato growers are taking a three million dollar loss on their crop due to dry weather. Although prices are better than they were last year, the crop has been cut so seriously that it more than offsets the better price.

Practically the same condition holds on Long Island. Although there have been rains recently they were not heavy enough to be of much benefit. Western New York reports heavy crop damage, although rains there have helped considerably. Apparently rain has been very spotted, hitting some sections in amounts sufficient to help crops and other sections have had very little rain.

Long Island Market Growers Meet at Mineola

ABOUT 150 farmers from Long Island met recently at the Mineola Courthouse to discuss market conditions in the Wallabout and Gansevoort markets. Mr. Thomas Dwyer, Commissioner of New York City markets was unable to be present, but Mr. Joseph Dunn, Director of Statistics at the Market Bureau was present and offered several suggestions for Mr. Dwyer. Mr. Dwyer suggested that speculators on the market be segregated into one section of the market rather than be excluded entirely and that farmers pay a yearly market fee rather than a daily fee for their privileges in the market. Mr. Dunn promised those present that a covered shed would be erected in both places and that water and wash-room facilities would be added for the convenience of those bringing in produce.

Farmers' Meetings

THE National Vegetable Growers Convention will be held in Philadelphia the week of August 19. In addition to the usual program of talks and discussions, there will be an inspection of the Philadelphia markets. The party will assemble at the terminal market at 4:30 A. M. and will be taken by bus through the market section, including an inspection tour of the Campbell soup plant.

The New York Vegetable Growers' Association held its annual field meeting at the State Experiment Station at Geneva, on July thirty-first.

Much interest is being shown all over the state in the Sullivan-Clinton Sesqui-Centennial celebration. The celebration at Cooperstown in Otsego County, is slated for August 9 and 10 and will include an historical pageant, dedication of the Sullivan-Clinton monument and an historical parade, aquatic sports on Otsego Lake, and fireworks in the evening.

N. B. C. Appeals to Farm Radio Audience

THE National Broadcasting Company is broadcasting a farm program from the largest daily network in the country. The network is made up of thirty stations with six additional stations which are included on Saturdays only. One feature of the broadcast which will be of interest to many of our readers will be the program put on by the American Farm Bureau Federation at 12:30 to 1:15 P. M. Central Standard Time on the fourth Saturday of each month.

Omission in Report of Standard Container Law

OUR attention has been called to the fact that there was an omission in the explanation of the new Federal Container Law on page 5 of the July 27th issue. The size of the hampers and round stave baskets for fruits and vegetables should have contained four additional capacities, namely, $\frac{1}{2}$ bushel, $\frac{3}{4}$ bushel, $\frac{1}{4}$ bushel, and one bushel. The complete list of sizes of standard

containers for fruits and vegetables consists of $\frac{1}{8}$ bushel, $\frac{1}{4}$ bushel, $\frac{1}{2}$ bushel, $\frac{3}{4}$ bushel, $\frac{1}{4}$ bushel, 1 bushel, $1\frac{1}{4}$ bushel, $1\frac{1}{2}$ bushel and 2 bushels.

Senate Revises Tariff Bill

THE Senate Finance Committee has been working on the tariff bill and made a number of changes in rates, particularly in agricultural products. The tariff on milk which was placed at 5c a gallon in the House bill, has been raised to 6 $\frac{1}{2}$ c and cream has been raised from 48c to 56 6/10c per gallon. The tariff on butter is left at 14c a pound the same as it was in the House bill. The duty on live poultry was raised from 6c to 8c and on dressed poultry from 8c to 10c. These figures, of course, are not yet law, but are merely compromise rates between Senate and House and will be acted upon when Congress convenes again.

Some New Books

"Spraying, Dusting and Fumigating of Plants"

By A. FREEMAN MASON

A new addition to the "Rural Manuals" which are edited by L. H. Bailey is just off the press. It is "Spraying, Dusting and Fumigating of Plants" by A. Freeman Mason of the Department of Horticulture of the University of Maryland.

The book is divided into two parts. In the first section the questions of spraying, dusting and fumigating are thoroughly discussed while the second section is devoted to the insects that attack fruits and crops.

The book tells you:

What pests to expect and how to identify and control them.

How to know the right spray materials and how to compare them for ingredients and price.

What to look for in spraying and dusting machinery.

How to remove spray residue.

How to mix sprays and dusts, fumigate, sterilize soil, treat seed, and meet every other pest control problem.

An unusually complete index enables the reader to quickly find the answer to any particular spraying problem. The book is published by MacMillan and is listed at \$5.00.

Pennsylvania Notes

Potter County—A frost on the morning of July 20th slightly damaged gardens, buckwheat, beans, etc. The threatened drought has been averted. Oats are poor. Corn for ensilage looks good. Hay is a very good crop. Demonstrations have been held throughout the county by the County Agent, teaching the proper method of slacking lime to get best results from the use of Bordeaux mixture. Apiaries have been state inspected for bee diseases. White honey retails from 20 to 25c a pound. Eggs bring 30c a dozen and dairy butter 50c a pound.—Mrs. H.E.J.

Northumberland County—Haying and harvesting is all done and the oats are just getting cut. The hay was a good crop also wheat. The grain runs 20 to 22 bushels to the acre. The corn mostly looks good, some the very best. Chickens per pound, 30c; eggs, dozen, 30c; butter per pound, 48c. Feed prices are very high. Corn \$1.00 per bushel and wheat, \$1.21 per bushel, oats 70c. It seems all localities have different prices.—S.W.

Cumberland County—After continued dry weather we are having very heavy rains, washing roads and fields. There is also hail with high winds doing much damage. Harvesting has commenced. Hay will be a big yield. Wheat everywhere is heavy and there are prospects for a big yield. Fruit of all kinds will be scarce throughout this valley. Berries are plentiful and bring good prices. A large creamery is being erected in Carlisle and they expect a good business. Wheat is 90, corn 95, oats 45, eggs 28 and butter 35.—J.B.K.

New York County Notes

Genesee County—Just as farmers were in despair of their crops, a heavy rain fell throughout the county. It was estimated as doing a million dollar's worth of good. A cow owned by Adelbert Parker was killed by lightning. In the northern part of the county crops are better than they have been in a number of years. Darien was hard hit by the drought and potatoes, buckwheat and corn only half came up. Earlier crops were too far along to be helped much by the rain.—Mrs. R.E.G.

Yates County—Wheat cutting is about over in this section and partly housed. Quality good, price \$1.30 and on the rise. Spring grain is ripening and will be a light crop on account of late sowing. The pea harvest is over, crop light; some growers will not get enough to pay for seed. All feeds are going up. Several farmers have taken out hail insurance. No hail yet. Pastures are getting short. Dairymen are feeding their cows grain and several corn. Corn is tasseling out and will be a good crop.—L.C.W.

Sullivan County—Many auto accidents have occurred. One tourist, not knowing the road, proceeded at too fast a speed, and several were killed. Most farmers have finished haying. Corn is very good but gardens are not doing well due to the dry weather. Several barns have burned because of spontaneous combustion. Pasture is very short and cows are losing on milk. Eggs are 45 to 50c and feed remains very high. Many roadmen are fixing the roads but much is still to be done.—P.E.

Columbia County—Another week of fine hay weather except one day of rain which wet only three inches down into the ground. Germantown was host to 21 fire companies recently. The old Hayner Paper Mill in Chatham Center burned down. A 5 $\frac{1}{2}$ lb. bass was caught in Lake Charlotte. A shortage of water is again threatened in Hudson and the Churchtown Reservoir is lowering rapidly. The Garden Club of Kinderhook visited the

home of L. P. Church on Mt. Merino. Postmaster Wright B. Drumm of Chatham has a pet crow; it roosts in a tree near his window every night. Mr. and Mrs. Flinn of Greenwich, Conn., entertained recently at the home of her parents. Professor and Mrs. J. M. Case are in Philmont, with movies of their hunting trip in the African jungle. Black caps 18c pt., cherries 15c a quart for white, 18c for red and 20c for black. Eggs 35c dozen.—Mrs. C.V.H.

Rensselaer County—A much needed rain came the other night. The hay crop is heavy with a low price for it. Corn is making fine growth. Potato bugs have arrived and are very busy. The acreage of potatoes is not as large as last year. Buckwheat is coming up. Cows are doing well and the demand for them is slack. Eggs are bringing 35c wholesale, with an upward tendency. Broilers are ready for market at fairly satisfactory prices. The weather is very changeable, with cool nights.—E.S.R.

Saratoga County—Haying is progressing rapidly. Extremely hot weather is helping corn to grow rapidly. Weather goes to extremes, only a few days ago frost was reported in many places, but most of the time it has been very hot, with damp foggy nights. Gardens are doing nicely and much rain has kept pastures in good condition. The farm women are very busy with canning and jelly and pickle making. Hens not producing quite as many eggs.—Mrs. L.W.P.

Washington County—Farmers are very busy harvesting the large hay crop. Many are using side delivery rakes and hay loaders. The weather has been excellent. Mr. Archie McCollum of Uxbridge, Mass., has purchased of George Maxwell the very desirable property in Coila known as the Ryder property. Mr. McCollum will soon begin the erection of a new dwelling house on the lot. Broilers are bringing 45c and 50c, eggs 45c. George E. McGeach is erecting a new tile silo.—H.C.C.

Home Bureau Women and Managers Go on Marketing Trip

New York Markets Show Produce Received from Nearby Growers and from the World at Large

FOR years it has been the habit of Mr. R. W. Quackenbush, Agricultural Agent of the New York Central Railroad, to organize and supervise marketing trips for groups of men, farmers particularly. These included trips to the important wholesale markets of New York City as well as other points

unharmful. The part that farm women have in packing and shipping farm produce is responsible for the trip being planned for them.

Nothing is so convincing as actually seeing for one's self. One of the visiting women was heard to remark after seeing the egg market, "We shall certainly have to grade our eggs better. Why, I saw the most beautifully graded eggs there, all the way from California, and a few cents cheaper than ours, too. It means we've got to give more attention to our pack."

The trip was practically the same as those previously arranged for the men, no attempt being made to make it easier or more feminine in nature.

Briefly, the itinerary was as follows:

Monday, July 22

3:30 A. M.—Left Hotel Wellington, (55th Street and 7th Avenue).

3:45 A. M.—Arrived at Pennsylvania Produce Terminal piers and noted the unloading, handling and distribution of fruits and vegetables from the south and west, which are handled on these piers, having a capacity of 700 cars daily.

5:10 A. M.—Visited Erie R. R. piers and noted handling of various perishable commodities arriving at these piers.

5:50 A. M.—Breakfast.

7:00 A. M.—Visited Fulton Fish Market.

8:00 A. M.—Convened in one of the auction rooms where auction was held and a talk on the whys and wherefores of the auction was given by Mr. I. B. Mercadante of Connolly Fruit Auction Company.

8:30 A. M.—Attended auction.

9:20 A. M.—Visited wholesale egg stores.

10:45 A. M.—Visited United Fruit Company Pier to note handling of shiploads of bananas.

12:15 P. M.—Luncheon at Gonfarone's after which Dr. A. E. Albrecht of the New York Office of the Department of Agriculture and Markets gave a brief outline of the volume of perishables coming into the New York Market.

2:30 P. M.—Embarked on New York Central tug for sightseeing trip around the Harbor as guests of the New York Central Railroad.

4:30 P. M.—Arrived at Dairymen's League Corp. Assn. and inspected the new offices of the organization.

Tuesday, July 23

9:00 A. M.—Arrived New York Central West Side Stock Yards to note the receiving and handling of sheep, hogs, cattle and calves for slaughter.

9:45 A. M.—Arrived 60th Street Poultry Yards, New York Central R. R. This is the only yard on Manhattan Island where freight shipments of poultry are unloaded.

10:45 A. M.—Arrived J. C. Penney Company for inspection of their 18 story building.

12:30 P. M.—Luncheon—guests of J. C. Penney Company.

MODERNISTIC PILLOW NO. C2055 comes stamped for quilting on green silk rayon. The design is painted on the material in washable, non-fade oil paints. The design is emphasized by outlining the design in black embroidery floss, using the quilting stitch. A black cord or black piping gives a good finish to the pillow. Price, enough material for top and back, \$1.35. Address Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

1:45 P. M.—Arrived National Biscuit Company, for general inspection of their plant.

3:30 P. M.—Arrived Hotel Commodore, for inspection of their pantries and kitchens.

Wednesday, July 24

7:15 A. M.—Arrived Railway Express Agency Terminal, where a short talk on the activities at the terminal was given by one of the Express officials.

9:45 A. M.—Arrived at the New

York Stock Exchange, which permitted the opening of the Exchange at 10:00 A. M., spending about fifteen minutes in the visitors' gallery, and then convened in the Board of Governors' Room, where Mr. Jason Westerfield gave a short talk on "What the New York Stock Exchange Represents."

11:15 A. M.—Arrived Orchard Street Pushcart Market to note some methods of serving the great East Side, one of the world's most populous centers. Contrary to common public opinion, the quality of food demanded by pushcart patrons is as high as anywhere in the city. However, they may buy in very small quantities.

1:15 P. M.—Started for trip through Holland Tunnel.

2:00 P. M.—Visited Federal Reserve Bank.

12:00 Mt.—Left hotel for New York Central milk platforms, to note arrival and handling of milk in cans and in tank cars, followed by a visit to the Dairymen's League plant at Avenue "B" and 19th Street.

A Practical Press

A PRESS to squeeze the juices out of a fruit for jelly, and for many other purposes is often needed about the home. Here is a way to make one that works very well and costs but little.

Take a board about three inches wide and five or six feet long. Cut it in half in the middle making two pieces. The board should be three-quarters to an inch thick. On one end cut the boards down so as to form handles. Take a couple of pieces of strong material such as harness leather and fasten together with them the ends of the boards, where they have been hewn down.

This should be done rather loosely. Screws are best for the fastening but nails will work all right if driven through the boards and clinched.

To use merely place the ground fruit or what ever is to be squeezed in a bag, place between the boards near the leather and bring the ends toward each other. By squeezing and then shaking the bag and squeezing again, as much juice can be taken out as with a "boughten" squeezer.—F. W. J., Mass.

ENVELOPE PURSE NO. B5228 is of imported tan velour, a fabric highly suited for fall and winter use. The package contains the velour stamped for embroidery, canvas interlining, rayon tafeta for inside lining and pocket, floss for embroidery, wooden button, ring and snap fastener. Price \$1.50. Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

of interest closely allied to the business of selling farm-raised products. But this year Mr. Quackenbush has added a new feature to these marketing trips in that he has arranged them for women. Some weeks ago on these pages appeared an account of the inspection trip made by the women members of the Dairymen's League. And now it is the members of the Home Bureaus, county home demonstration agents and 4-H club leaders who made such a trip on July 22nd, 23rd and 24th. From seventeen counties they came, thirty-nine of them and the picture below shows who they are and whence they came. (Two who attended failed to get in the picture).

For three days the buses transported the party from stop to stop, always on time, and carrying them to places often out of the beaten path of the average tourist. It is only on such an organized trip that one can get a comprehensive picture of what it means to handle the enormous food supply of this great city and what needs to be done to get that food to its destination fresh and

The above party went on the three-day marketing trip, July 22, 23, 24, arranged by R. W. Quackenbush: 1. Mr. George Dallas, New York City, 2. Dr. C. S. Goodwin, Bridgeport, 3. Mrs. H. Truberg, Malverne, L. I., 4. Miss Millie Truberg, New York City, 5. Miss Ruth Boies, Penn Yan, 6. Mr. Louis Cooper, New York City, 7. Mrs. A. H. Gross, Cortland, 8. Miss Marjorie Bunting, Jamestown, 9. Mrs. H. B. Strong, Oswego, 10. Miss Carona Torrey, Canandaigua, 11. Miss Ethel Olsen, Owego, 12. Miss Elizabeth Woolley, Cortland, 13. Miss Lois Doren, Cortland, 14. Miss Gladys Adams, Norwich, 15. Mrs. J. L. Truman, Owego, 16. Miss Mabel Milhan, Canton, 17. Mrs. E. L. Fullerton, Medford, L. I., 18. Mrs. William Gainey, Phelps, 19. Mrs. Arthur Graham, Newark Valley, 20. Mrs. C. S. Goodwin, Bridgeport, 21. Miss Virginia Brewster, Canandaigua, 22. Mrs. L. F. Tupper, Elmira, 23. Miss A. Ruth Jonas, Utica, 24. Mrs. M. B. Ellenwood, Whitesboro, 25. Miss M. L. Ford, New York City, 26. Mrs. C. A. Onsrud, Whitesboro, N. Y., 27. Mrs. C. A. Torrey, Canandaigua, 28. Mrs. C. L. Robinson, Chenango Forks, 29. Miss Alta McLean, Chenango Forks, 30. Mrs. R. W. Quackenbush, Ridgefield Park, N. J., 31. Mr. R. W. Quackenbush, New York City, 32. Mrs. E. A. Landon, Vestal, 33. Miss Evelyn Nance, Kingston, 34. Mrs. E. K. Young, Milton, 35. Mrs. Roscoe Pine, Hoosick Falls, 36. Mrs. Grace Hockett, New York City, 37. Mrs. Ann Phillips Duncan.

Aunt Janet's Counsel Corner

Lonely Country Reader Wishes Companionship of Elderly Women

DEAR AUNT JANET:

I am a lone widow and would like to get an old lady who needs a good home. I want her to do only light work, wash dishes, as I do all my cooking. But I want some one for company. I would give her board and some clothes. I live in the country and there is only myself. I can give the best reference. I would also like to get an old man to board for the winter, he of course to pay his board.—LONELY.

This request comes from Washington County, New York. If you know of any person who might be interested in Lonely's request, have her send references and, as Lonely states, she is able to do the same. Aunt Janet will provide the complete address to those who are interested.—AUNT JANET.

Tested Recipes

Dutch Beans

String and cut in small pieces, two quarts of green string beans (not necessarily green in color but tender and nice). Cover with boiling water and cook until done, either in the saucepan or double boiler. Add one level teaspoon salt when you add the water. If any water is left on when done, drain. Place one fourth pound of bacon or the trimmings of fat ham, (after being chopped fine) in the frying pan and fry brown. Now remove the browned meat and add to the fat one level tablespoon each of flour and sugar, one teaspoon prepared mustard, and a dash of cayenne and cook stirring constantly, until well browned. Then add to the stirred mixture, four large onions well minced and the beans and mix together thoroughly. Let stand one hour before serving, keeping them warm all the while; or they can be served cold if so desired.

Fine for School

2872

DRESS PATTERN NO. 2872 is excellent for the young girl's wear at the end of summer or for school which is to come so soon. The pretty printed piques, linens or percales would make up to be most attractive as well as serviceable. The pattern cuts in sizes 6, 8, 10, 12 and 14 years. In the 8-year size, this style takes 1 3/4 yards of 36-inch material, with 3/8 yard of 40-inch contrasting material. PRICE 13c.

Do not keep them too hot, just warm.—CLARICE RAYMOND, New York.

One's taste must guide as to the amount of sugar added. In seasoning any vegetable care must be taken not to spoil the fresh natural flavor by too much salt or sugar.

* * *

Cream Filling

One half cup sugar, one cup milk and a pinch of salt. After the above boils stir in one tablespoon each of flour and cornstarch which have been blended smooth in one half cup sweet milk. Stir constantly until it thickens. Then remove from the fire and stir in one egg well beaten to a froth and flavoring preferred. Use immediately. (If beaten plentifully after the egg is added it improves the mixture very much.)—CLARICE RAYMOND, New York.

This standard filling may be made richer by adding another egg and perhaps a little cream or butter.

* * *

Corn Kisses

One can use corn so large for this that it is not very good for table use otherwise. Cut the corn down the cob in the middle of each row, then scrape

Slenderizing Lines

2875

DRESS PATTERN NO. 2875 is particularly fortunate for full figures because of its slenderizing lines. Unlike many "stylish stout" dress designs, this one is youthful and has real style to it. The tucked vestee and hip band give an attractive trim while the free hanging tie gives the long lines needed. Since full figures usually appear to best advantage in materials having some weight, flat crepe or other heavy silk is best for this design. Pattern cuts in sizes 16, 18 years, 36, 38, 40, 42, 44, 46 and 48 inches bust measure. Size 36 requires 3 1/2 yards of 40 inch material with 3/4 yard of 18-inch contrasting for vestee and 1/2 yard of 36 inch for tie.—PRICE 13c.

out the contents of the kernels. In one cup of corn, thus cut, add one spoonful (heaping) of flour, two well beaten eggs, salt to taste and one level teaspoon baking powder. Drop in small spoonfuls (teaspoons preferably) on a hot griddle or frying pan well greased and turn and fry brown on both sides. A spoonful of brown sugar will better bring out the corn flavor and many prefer it that way. Serve hot with but-

ter and sugar.—CLARICE RAYMOND, New York.

The A.A. recommends level measurements in all cases. Instead of heaping teaspoons use level tablespoons of flour.

Don'ts for Knitted Garments

IN laundering the knitted garments so popular this season, success will depend upon the methods used.

1. Don't stretch the garment while

Sunburst Neckline

2911

BLOUSE PATTERN NO. 2911 with its sunburst effect at the neckline and jabot frills is most becoming and modish for general wear. Made of eggshell crepe and worn with a pleated silk skirt, this blouse would make a charming addition to any woman's wardrobe. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2 1/4 yards of 39-inch material. PRICE 13c.

TO ORDER Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c. for our fashion catalogue and send to Pattern Department, American Agriculturist, 461 Fourth Ave., New York City.

heavy with water. Lift carefully to prevent stretching.

2. Don't wring or hang on a line to dry. Gently squeeze out water while holding between two hands. Roll between bath towels to absorb excess moisture. Lay out on a soft cloth and shape back to original measurements.

3. Artificial silk (rayon) garments need special care as they are very weak when wet.

Do You Know That—

An easy way to crush nuts is to use a rolling pin on a board.

* * *

To alternate two pairs of shoes is more economical than to wear one pair continuously.

* * *

Carefully scrape soiled dishes and cooking utensils to prevent grease-clogged sink drains.

* * *

Light colored walls in the kitchen reflect and distribute both artificial and natural light.

* * *

To save left-over egg yolks cover them with cold water and keep them in the refrigerator, or drop them in boiling water and cook them until hard. If cooked, when the yolk is cold press it through a sieve and keep it to garnish creamed dishes or salads.

* * *

To save time in making custards, scald the milk before adding it to the egg.

* * *

Careful planning cuts down time in preparation of meals.

Practice true economy . . .

Save yourself!

What if you do save a few pennies on washday, if it means more work for you? Fels-Naptha gives you, not more soap, but more help. The extra help of two active cleaners, joined in a single golden bar. Naptha, the dirt-loosener (smell it!), and good golden soap, the dirt-remover . . . That's what makes Fels-Naptha a better washday bargain. It saves you! Buy Fels-Naptha today . . . at your grocer's.

The Plains of Abraham—By James Oliver Curwood

So tragedy began to move, to build out of death, out of betrayed confidence, out of dishonour and fraud and pitiless murder the American and Canadian nations of the future.

Without declaring war, England was sending General Braddock and an army to kill off the French and their Indians in the American wilderness; and, trying to outdo the other hypocrite, France was sending Baron Dieskau and an army to reap the waiting crop of Colonial lives.

Glorious France!

Honourable England!

Eighty thousand French and more than a million English in the New World cried these untruths as they made ready for the sacrifice. Massachusetts enlisted one man out of eight of her male population. Connecticut, New Hampshire, Rhode Island, New York, and the others followed her example.

Children, loyal, proud to fight—and hating the French ferociously!

Then came Braddock, preceding Wolfe, to call them worthless trash.

And New France, a glory of sun and land even now gutted of her prosperity by corruptions brought from Louis and La Pompadour, sent out her own sons to fight and kill, valiant, glad, confident—and hating the English implacably!

With them, on both sides, went Indians from almost a hundred tribes—red men who had once found honour in fighting, but who, now, skulking and murderous and vengeful, found their souls in pawn to the White Fathers across the sea who had prostituted them with whiskey, bought them with guns, maddened them with hatreds, and who paid them for human hair.

Proud old England!

Chivalrous France!

Pride and chivalry and love—of these things Jeems was thinking as winter grew into spring and spring into summer. Only love held him from leaping to the temptations which were drawing closer about him, love for his mother whose happiness marked the beginning and the end of all action on the part of her men folk. And in this hour, when three out of four of the fighting men along the Richelieu were preparing to join Dieskau, when half of his acquaintances at the Tonteur seigneurie had already gone to fight Braddock, when the forests trembled at the stealthy tread of painted savages, and when the Frenchman who did not rise to his country's call was no longer a Frenchman, Jeems observed that the strain upon his father was more difficult to bear than his own. For Henri, in spite of his worship of Catherine, was of New France to the bottom of his soul, and now that other men were making a bulwark of their bodies against her enemies, his own desire to make the same sacrifice was almost beyond the power of his strong will to control. In their years of comradeship, Jeems and his father had never come so near to each other as in these weeks of tension.

Almost as painful to them as the sting of a wound was the day when Dieskau came up the Richelieu with a host of three thousand five hundred men and made forever a hollowed ground at the Tonteur seigneurie by camping there overnight.

When she knew they were coming, Catherine had said:

"If your hearts tell you it is right, go with them."

But they remained. For Henri it was a struggle greater than Dieskau fought, greater than that in which Braddock died. For Jeems it was less a torment and more the mysterious madness of youth to tramp to the clash of arms. For Catherine it was the gehenna of her life, a siege of darkness and uncertainty in her soul which gave way suddenly before news which swept like a whirlwind over the land.

God had been with New France!

Braddock and his English invaders

were destroyed! No triumph of French arms in the New World had been so complete, and Dieskau, the great German baron who was fighting for France, moved southward to crush Sir William Johnson and his Colonials and Indians, planning not to stop until he had driven them to the doors of Albany.

With him were six hundred and eighty-four of the loyal men who were beginning to call themselves Canadians.

Tonteur rode over to bring the news to Henri Bulain. To Catherine he recalled his prediction that the English

ily, and some of his habits had changed. He was not as eager for the long liked the warm sun. He was growing content to watch life with Jeems instead of ceaselessly pursuing it. He was not old, and yet he was no longer young. With increasing age, which was leading him down into the shadows slowly, had come a deeper wisdom, sharper instincts, keener visionings even where he did not see so far or so clearly. There remained one thing which did not fail to stir in him the tense fierceness of his youth. This was the Indian smell. He always told Jeems when one of their wilderness

to stir more deeply and with almost a savage insistence the yearnings that and tireless hunts in the forest, and had for so long been smouldering in his breast. Off there was where he wanted to be, where dramas such as he had heard about but had never seen were being played, where men were fighting and where the chivalry and courage of which he had dreamed himself a part were painting themselves in colours of triumph and glory in the history of his world. And there was where he should be.

They came to Lussan's, nine miles from their home. Since Lussan's departure, the place had been abandoned, and in those five years the wilderness had largely reclaimed what man had taken from it. The big green open in which the crowd had assembled and where Toinette and Paul Tache had walked so proudly was overgrown with sumacs and blackberry bushes. Tall grass flourished about the house. Where the gardens had been was a tangle of weeds and briars. A few rose bushes struggled against the inundation, and a single sunflower, a last survival of propagation through many seasons, stood with its black-seeded face toward the western sun. Porcupines had eaten at the doors of the house. Shutterless windows gaped to the winds and rains. The path leading to the barn was cluttered with growth, and at the end of it the barn itself was a dead thing hidden from the sun. A tree had fallen, crushing in its roof; poison ivy festooned its rotting foundations, and shadows were all about it. The cow yard was rank with burdock, ragweed, and thistles. Sections of the pole fence about it had slumped to the ground.

Jeems stood where he had fought Paul Tache, and ghostly whispers crept about him in the stillness. They stirred an aching loneliness in his heart, as if this desertion and ruin were all that remained of his own hopes and ambitions. Then came a feeling of dread, almost of fear. He turned back to the house and to the open, where long ago he had stood with Toinette and all her loveliness so near to him.

The sun had set and dusk was gathering over the land before he drew himself away from the ghosts which haunted Lussan's place. Night could add nothing more to his gloom.

Odd whined frequently in his eagerness to reach home. Sometimes he showed impatience at his master's slowness by running ahead. Jeems did not hurry. He unslung his bow, which was the only weapon he had brought, and carried it ready in his hand. Yet if Odd had hinted of danger he would have paid no attention to the warning. Danger was miles away on the other side of Dieskau and his men. It would come no nearer and he would never have a chance to meet it. In Toinette's eyes he would always remain a renegade and a coward.

Night thickened. The stars came out. Deepening shadows lay about them as they climbed the tallest of the hills, from which they could look over the ridges and woods between them and Forbidden Valley.

From this hill, which was four miles from the Bulain clearing, they had gazed many times upon an amazing world. In all directions but one their eyes could reach over endless miles of unpeopled domain until the sky seemed to touch the timber. But on the point from which they might have viewed the Tonteur seigneurie, trees had grown tall and thick, shutting out their vision.

Because from this hill it was possible to see over the Big Forest which sheltered their farm from the north winds, Jeems and his father called it Home Mountain.

Odd whined as he climbed it tonight. He went ahead of Jeems, and when he gained the crest his whining changed to a howl, so low that one would scarcely have heard it at the foot of the hill.

(Continued on Page 17)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems apologizes to Toinette and Tonteur visits the Bulain home where he and Hepsibah have another friendly (?) battle much to Catherine's dismay.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems.

would never get into this paradise of theirs. Now the whole thing was settled for many years to come, for Dieskau would sweep their last enemy from the Champlain country as completely as a new broom swept her home. A dozen times he insisted on shaking hands with Hepsibah, who was with the Bulains this summer, repeating that he loved him personally and that no ill thought could exist between them. But he was frank in his avowal that he held a mighty grudge against the encroaching English. He had sent almost every man he had to the scene of fighting, and only his wooden leg had kept him from joining Dieskau.

Even Toinette had wanted to go!

This recalled an important matter to his mind. Toinette had entrusted him with a letter for Jeems. Boiling over with his own selfish exultations, he had forgotten it. He hoped it was an invitation for Jeems to come to the seigneurie. He had often told his girl she should be more friendly with the lad.

Jeems took the letter and went off by himself. It was the first recognition from Toinette since the day of the levee. He had not seen her and had tried not to think of her. Alone, he read the words she had written him.

With pitiless coldness and brevity, they called him a renegade and a coward.

On a September morning some days later, Jeems stood watching his uncle as he disappeared into the frost-tinted woods of Forbidden Valley. It seemed to him that Hepsibah's suspicions and guardianship of the valley had become greater with the growing news of French triumphs in the south which so positively assured their safety. Only yesterday Tonteur had brought the latest word from Dieskau. The German had been on the eve of smashing Sir William Johnson and his mob of Colonials and Indians when his messenger had left. By this time the event had probably happened, Jeems thought. Yet his uncle was going into Forbidden Valley with a look in his face which puzzled him.

Restlessness possessed Odd after Hepsibah had gone. Years were beginning to leave their mark on the dog. He was past the prime of his splendid strength, and the hair about his muzzle was graying a little. He was gaunter, shaggier, limped a bit more heav-

visitors was near, sometimes many minutes before the savage appeared from the woods. And he never tired of watching Forbidden Valley. In the dawn he faced it. At midday he dozed with his half-closed eyes turned toward it. In the evening he sniffed its scents. Yet he did not go down into the valley unless Jeems or Henri was with him.

During the morning, Odd's uneasiness began to reflect itself in Jeems. Soon after noon, he left his work and told his mother he was going in the direction of Lussan's place. Catherine walked with him through the young orchard and up the slope. Never had she seemed more beautiful to Jeems. The glory of the day, its warm blue skies, the tinted forests, the golden pools of sunlight over the earth all seemed a part of her. His father was right—this mother of his would always be a girl. From above the orchard, standing on a little plateau that overlooked the Bulain farm, they called to Henri, who was in his turnip field, and waved at him. Jeems stood for a few moments with his arm about his mother. Then he kissed her, and Catherine watched him until he was lost to her sight in the Big Forest.

Jeems did not have the desire to hunt, nor did Odd. Unexplainable impulses were pulling at them both. Odd's restlessness was unlike his master's. Whenever Jeems paused, the dog turned and sniffed the air of their trail, facing Forbidden Valley in an attitude of suspicion and doubt. Jeems observed his companion's enigmatic actions. Odd was not giving the Indian signal. It was as if something without form or substance, a thing bewildering and unintelligible, lay behind them.

The counter impulse in Jeems was to go on. Without a reason or a purpose, except that the disquiet in his mind demanded it, he was heading for Lussan's place. The air was crisp. Fallen leaves rustled under his feet. From the hilltops the country lay about him in sweeping panoramas of reds and golds and yellows and browns, and he began to look back from these hilltops—far into the Indian summer haze which hung like a gossamer veil between him and the adventure-filled country of Lake Champlain and Lake George, where so many things were happening. It was the kind of day, trembling with promise and lure,

The Farm Relief Law

(Continued from Page 2)

(4) Extending membership of the cooperative association applying for the loan by educating the producers of the commodity handled by the association in the advantages of cooperative marketing of that commodity; and

(5) Enabling the cooperative association applying for the loan to advance to its members a greater share of the market price of the commodity delivered to the association than is practicable under other credit facilities.

EDITOR'S NOTE—It will be noted that the law plans to work almost exclusively through cooperative associations. For example, one of the Florida fruit associations recently applied for a loan to the new Farm Board to help it out in its difficulties caused by the Mediterranean fruit fly. The Board replied by suggesting that before a loan would be granted, the association asking for it should unite or join with the other Florida citrus growers' association and that the two work together.

If the same policy is followed, it may result eventually in many cooperatives getting together which are acting now more or less in rival capacities.

The attitude of the Farm Law and of the Farm Board toward cooperation raises an interesting question as to what may happen to the farmer who is selling his products as an individual and not cooperatively.

Stabilization Corporation

SEC. 9. (a) The board may, upon application of the advisory committee for any commodity, recognize as a stabilization corporation for the commodity any corporation if—

(1) The board finds that the marketing situation with respect to the agricultural commodity requires or may require the establishment of a stabilization corporation in order effectively to carry out the policy declared in section 1; and

(2) The board finds that the corporation is duly organized under the laws of a State or Territory; and

(3) The board finds that all the outstanding voting stock or membership interests in the corporation are and may be owned only by cooperative associations handling the commodity; and

(4) The corporation agrees with the board to adopt such by-laws as the board may from time to time require, which by-laws, among other matters, shall permit cooperative associations not stockholders or members of the corporation to become stockholders or members therein upon equitable terms.

(b) Any stabilization corporation for an agricultural commodity (1) may act as a marketing agency for its stockholders or members in preparing, handling, storing, processing, and merchandising for their account any quantity of the agricultural commodity in furtherance of the policy declared in section 1, may prepare, purchase, handle, store, process, and merchandise, otherwise than for the account of its stockholders or members, any quantity of the agricultural commodity or its food products, whether or not such commodity or products are acquired from its stockholders or members.

(c) Upon request of the advisory committee for any commodity, the board is authorized to make loans from the revolving fund to the stabilization corporation for the commodity for working capital to enable the corporation to act as a marketing agency for its stockholders or members as hereinbefore provided.

(d) Upon request of the advisory committee for any commodity, the board is authorized to make loans from the revolving fund to the stabilization corporation for the commodity to enable the corporation to control any surplus in the commodity as hereinbefore provided and before meeting carrying and handling charges and other operating expenses in connection therewith. The board shall require a stabilization corporation to establish and maintain adequate reserves from its profits from its surplus control operations before it shall pay any dividends out of such profits. All losses of the corporation from such operations shall be paid from such reserves or if such

reserves are inadequate, then such losses shall be paid by the board as a loan from the revolving fund.

EDITOR'S NOTE—You will see here that it is not the plan of the Federal Board to buy products and store them itself in order to stabilize the market, but it is planned to help cooperative organizations by loans and otherwise to store their surplus products so that they can distribute them on the market more evenly without glutting the markets.

Where it is not practical to use the cooperative organizations as such stabilizers, then the Board will recognize and support any corporation, under certain conditions, which will help stabilize the market by buying and storing farm products. For example you will read on page 5 in this issue how the Farm Board has already proposed to the various grain cooperatives that they organize a \$20,000,000 grain corporation for stabilizing the grain marketing. Such a corporation would be eligible to receive loans and other support from the Farm Board.

Clearing-House Associations

SEC. 10. Upon application of any cooperative association handling an agricultural commodity or of producers of an agricultural commodity, the board is authorized, if it deems such association or producers representative of the commodity, to assist in forming producer-controlled clearing-house associations adapted to effecting the economic distribution of the agricultural commodity among the various markets.

Price Insurance

SEC. 11. The board is authorized, upon application of cooperative associations, to enter into agreements, subject to the conditions hereinafter specified, for the insurance of the cooperative associations against loss through price decline in the agricultural commodity handled by the associations and produced by the members thereof. Such agreements shall be entered into only if, in the judgment of the board, (1) coverage is not available from private agencies at reasonable rates, (2) the insurance will be in furtherance of the policy declared in section 1, (3) the agricultural commodity is regularly bought and sold in the markets in sufficient volume to establish a recognized basic price for the market grades of the commodity, and (4) there is available with respect to the commodity such market information as will afford an accurate record of prevailing prices for the commodity covering a period of years of sufficient length to serve as a basis to calculate the risk and fix the premium for the insurance. The agreements shall require payment of premiums so fixed and shall include such other terms as, in the judgment of the board, are necessary. The board may make advances from the revolving fund to meet obligations under any insurance agreement, but such advances, together with the interest thereon, shall, as soon as practicable, be repaid from the proceeds of insurance premiums.

SHE—It's going to storm, dear. Did you shut the windows downstairs?—LIFE.

Auto Insurance Not Compulsory

Will you kindly explain to me in regard to the new automobile insurance law. The insurance agents tell me it is compulsory. Is this so?

THE new law, commonly called the Motor Vehicle Financial Responsibility Law which was enacted last April and which will become effective September 1, is not a compulsory automobile insurance law in spite of the fact that it seems to be a general understanding that such is the case.

There is no legal necessity for anyone taking out liability insurance so long as one does not have an accident or be convicted of certain violations of the motor vehicle law, including reckless driving, causing an injury to a person or property, driving while intoxicated, leaving the scene of an accident without making known one's identity or driving a car without a driver's license.

If a driver does have an accident and a court judgment for damages is given against him, it will be necessary for the driver to show ability to satisfy the judgment to the extent of five thousand for injury or death to one person, ten thousand for death or injury to two persons and one thousand

for property damage. The Bureau of Motor Vehicles will suspend a driver's license and car registration certificates unless such financial responsibility can be shown. The possession of an automobile accident insurance policy is one way of doing this.

Deposit Returned

SOME time ago I wrote to you concerning a deposit of \$25.00 paid to the _____ Company. In due time we received a return of the deposit, due to your efforts, and I assure you I am very grateful to your paper, and the Service Bureau for what you have done for me.

Wishing you success in the future as in the past, I remain.

While we are thoroughly in sympathy with the idea of liability insurance and believe that it is advisable for every driver to have such a policy, we cannot emphasize too strongly that the new law which goes into effect September 1, is not a compulsory insurance law.

Another Clipping Service

Can you give us any information concerning the Schenectady Clipping Service. We recently received a card from them saying they had a news article which appeared in one of the daily papers which would be of interest to us. It would cost us 25c. Is this a money making scheme?

THERE are many concerns such as the Schenectady Clipping Service, and on most occasions it is found that the item is simply a very minor item, probably taken from some local paper. We have always recommended to our subscribers that no attention be paid to these notices, as they are seldom of any interest.

Books On the Installment Plan

THIS is the time of year when book agents are especially active among the new crop of girl graduates from teachers' training classes and colleges. To a girl whose income has been lim-

ited for four years it looks absurdly easy to meet the monthly payment for a set of books. At the same time these new teachers are ambitious to make good and are easily convinced that these books are essential to their success.

Judging from the letters we have received in the past, many of them later find that the installments are far from easy to pay and that the books they have purchased are of doubtful value to them in their work. We suggest to them that they consider the matter very carefully before entering into any such contract. Many times they change their minds and attempt to cancel the order, only to find that they have signed a binding contract.

We Get a Few "Knocks"

"I was more than surprised when I received your letter, to note that you had taken sides with the Express Company in regard to my claim."

"We have a feeling that many of your subscribers use the farm paper service bureaus unfairly in sending them claims which are entirely unreasonable. We have no objection to settling a claim which is justified, but do not like to be held up when we know that these subscribers are in the wrong."

THE first of the above letters came from a subscriber who put in a claim through the Express Company for eggs shipped and damaged in transit. The Express Company, after an investigation, reported that the eggs had been sent in a second-hand case and fillers and that their regulations plainly stated that they did not accept responsibility in such cases. Our taking sides in this case consisted of writing to our subscriber that whereas we had found the Express Company fair in making adjustments where liability could be shown, that there was little chance of getting them to reconsider after they had made an investigation and arrived at a decision.

The second letter comes from an advertiser in reply to a complaint which we forwarded to him. In this case, our subscriber bought a tire which soon went bad. The company was reliable and the tire was returned to them. They reported that it showed unmistakable evidence of a bruise caused by running when under-inflated. No tire company will make adjust-

ments except for defective materials or workmanship.

We are printing the two letters for a purpose, namely to show that the task of a peacemaker is not any easy one. As a matter of fact, we do our utmost to be fair both to our readers and to commercial firms.

No Security for Money Paid

THE National Better Business Bureau has published a warning urging investors to consider carefully before investing in the European subsidiaries of the Ford Motor Company under the plan being offered by a certain New York City firm. This firm solicits investors by letter, telephone, and telegraph. The investor is required to make a deposit of from \$3.00 to \$7.00 a share, and in some cases is required

A Friend in Need

HAVE received the draft for \$30 on the North American Accident Ins. Co. which I acknowledge with "thanks." A friend in need is a friend indeed. I always have a good word for your paper and the insurance.

Yours truly,
George Erickson,
Flanders, N. Y.

to pay \$1.00 per share as a service charge, which is believed to be excessive. As we understand it, investors are really paying for what might be called an option on these shares, as at this date no complete definite announcement of financing plans of the Ford Motor Company subsidiaries has been made in this country. It is possible that these firms will not receive any stock except by purchases on the open market, which makes it necessary that an investor placing such an order should make certain that the deposit will be returned in case the stock cannot be delivered.

U.S.D.A. Warns Against Fake Insecticides

THE United States Department of Agriculture publishes a warning against certain types of insecticides which are being offered for sale.

First, Do not buy preparations to be added to feed and drinking water, which is claimed to control external parasites on poultry and other animals.

Second, Avoid preparations designed to be absorbed by the sap of trees for the purpose of controlling fungus diseases, and to kill insects.

Third, Preparations to be hung in the home, to drive away household

How Banks Are Supervised

RECENTLY, rather sensational failures of several banks in the Metropolitan area have turned the attention of the depositors toward banks in general. For the information of our subscribers, we are giving a little information about the organization of banks.

There are five different types of banks operating in New York City, namely, national banks, state banks, trust companies, savings banks, and private banks.

Considerable attention has been focused on the private banks due to the failure of the Clark Brothers bank in New York City. Under the State Law, the Banking Department has control over private banks only when they use the names "bank", "banking", and similar titles in their business, and where they pay interest on deposits of less than \$500. Otherwise the State Banking Department has no supervision over them, which accounts for the fact that many large Wall Street banking firms are not supervised by the New York State Banking Department. As a matter of fact, the state for some time has discouraged the formation of private banks.

To all practical purposes, state banks and trust companies do not differ much. Originally, a trust company

was a corporation to act as executor of wills, and as trustees and administrators of estates of deceased, minor, or lunatic persons. However, competitive conditions have resulted in changes which make the two practically identical in the business they do.

In the same way, the national bank has little practical difference from a state bank, or trust company. However, national banks are in general more rigorously supervised than any other bank in the country. They are required to be members of the Federal Reserve System, while other banks are allowed to be members or not, as they may choose. National banks are under direct control of the Comptroller of the Currency, whose examiners may go to the bank at any time, and who have wide powers over the bank, in case their business seems to be a little shaky. At one time the national banks had the power of issuing paper money, but this practice is decreasing, and ultimately the Federal Reserve currency will be the only bank notes in circulation.

The State Banking Department has similar control over state banks, and whereas no law can ever be passed which will insure absolute safety to bank depositors, the supervision is much stricter than it used to be.

The Easy Way to Kill Lice on Poultry

No matter how big the flock or how lousy, only a small paint brush, a can of "Black Leaf 40" and a few minutes time for "painting" it on top of the roosts are required to rid an entire flock of body-lice.

Do away with old laborious and disagreeable methods of dusting, dipping and greasing!

Paint the Roosts

Just Paint the Roosts with "Black Leaf 40"

About a half hour before fowls perch, "paint" "Black Leaf 40" on top of roosts. When fowls perch upon roosts that have been so "painted", fumes are slowly released that permeate the feathers, killing the lice. The treatment is so easy, effective and cheap that poultry owners need never be bothered by lice on their flocks. Think of the time, labor and expense that this method saves! There is no individual handling of fowls. "Black Leaf 40" is sold by poultry supply dealers. \$1.25 size treats 100 feet of roost. Ask your dealer or write us.

pests, and purify the air, and prevent diseases are branded as useless by the U. S. Department of Agriculture officials.

It is found that one preparation sold which can be purchased at \$.18 a gallon, was retailed at \$64.00 a gallon. Neither this preparation nor other similar ones could possibly produce the results claimed for them.

The Plains of Abraham

(Continued from Page 14)

Jeems came to him and stopped.

For a space, there was no beating of a heart in his breast—nothing but a stillness that was like death, a shock that was like death, a horror that could come only at the sight and the feeling of death.

Rising from the far side of the forest into which Hepsibah had gone that morning was a distant glow of fire. Nearer, over the rim of Forbidden Valley, the sky was a red illumination of flame. And this illumination was not of a burning forest. It was not a torch of burning stumps. It was not a conflagration of dry swamp grass reflecting itself against a moonless heaven. It was a tower of blazing light, mushrooming as it rose, flattening itself in a sinister scarlet radiance under the clouds, dripping at its edges into colours of silver and gold and blood.

His home was burning!

With the cry that came from his lips, there leapt madly into his mind the words that Hepsibah had spoken to him a last time that morning: "If ever I'm off there and you see a fire lighting up the sky by night, or smoke darkening it by day, hurry to the seigneurie with your father and mother as fast as you can go, for it will mean my hand has set the heavens talking to you and that the peril o' death is near."

CHAPTER IX

FOR a space Jeems could not move as he gazed at the crimson sky. Doubt might have eased the thoughts that crowded on his senses, but during the time in which he stood numb and voiceless there was no doubt. His home was in flames. This alone would not have deadened him with horror.

(To be Continued Next Week)

The Sign of Protection

Pure Milk Saves Lives of Thousands

(Continued from Page 3)

popular with milk dealers for it enabled them to sell as sweet and fresh milk which was several days old.

Laboratory investigation by Professor Park and his colleagues showed that this form of pasteurization was absolutely insufficient to kill the tubercle bacilli and other resistant disease germs. Inasmuch as bovine tuberculosis was very prevalent on farms supplying New York City, and since 10 per cent of the milk sold in the city was then found to contain living tubercle bacilli, the Department of Health determined that all milk sold in New York City should be *effectively* pasteurized. On the basis of Park's investigations, the Board of Health decreed that effective pasteurization meant holding the milk at 143 degrees Fahrenheit for thirty minutes.

Must Have Permits

In order to control effectively the milk supplied to the people of New York City the Board of Health had enacted a law which provided that no milk could be sold in the city without a permit from the Board of Health and subject to Board of Health regulations. Among these regulations was the requirement that milk should be kept at 50 degrees Fahrenheit from the time of production to its delivery to the city consumer. This requirement aroused a great deal of opposition and was contested in the courts.

A shipment of milk in which the requirement was not met was stopped as it entered the city and dumped into the gutter. The affected milk dealer contended that this act constituted confiscation of property without due process of law. The case finally came before the United States Supreme Court which fully upheld the right of the health authorities to regulate the sale of milk by a system of permits.

This pioneer step of the New York Board of Health, to prevent the sale of milk except under a permit, has since been copied by states and municipalities elsewhere and constitutes the basis on which health authorities everywhere in this country now deal with the milk supply.

Hand in hand with the work of improving the production and handling of milk on its way to the city, the Board of Health took steps to improve conditions in the city. The use of dipped milk purchased from dirty grocery stores was discouraged. Permits for the sale of milk in the city were given only to those who would provide cleanly conditions and keep the milk properly cool.

An intensive campaign of education was carried on so that mothers would appreciate the value of clean milk for their babies. Facilities were established where poor mothers could purchase at reduced prices milk suitable for infant feeding.

It is interesting in this connection to remember that many mothers eagerly desire to give their babies human milk. Human milk, of course, suits the needs of the baby better than the purest cow's milk. For delicate babies it is sometimes imperative. Therefore, the

city has established stations where human milk may be bought for babies whose health demands it and whose mothers are unable to supply it. The milk is drawn from healthy mothers and tested for its quality. The milk thus collected is mixed so that no one mother's milk is sold alone. Monthly analyses are made of the pooled milk to determine its quality. The mothers who supply it are paid 15 cents an ounce and it is sold for 30 cents an ounce to those who can afford to pay. Others may get it at a reduced cost, or, in very needy cases, free of charge.

With the introduction of methods for the thorough pasteurization of milk, I am glad to say, there has not been a single epidemic of milk-borne typhoid fever or other milk-borne disease in the City of New York. As Commissioner of Health of New York City, I am equally proud of the fact that this city was the first municipality to take steps to guarantee its citizens, and particularly its babies, a safe and wholesome milk supply.

Health officers for many years have studied carefully the infant mortality rate. In New York City the rate last year was 66, which means that out of every thousand babies born 66 died during the first year of life. This figure marks an increase of ten over the year 1927, for in 1927 only 56 babies died out of every thousand born. The Health Department, therefore, is spurred to further efforts to increase the health and happiness of its infant population.

The infant mortality rate of New York City, however, compares favorably with that of the country as a whole, which last year was 68 per 1,000, two points higher than that for the city. And New York City's infant death rate also compares favorably with other municipalities.

Still Chance for Improvement

The fact that in some cities the infant death rate is lower than it is in New York City makes the Health Department strive to improve the good showing it has already made. It must be borne in mind, however, that New York is a city of six millions, many of them living in crowded tenement districts. It cannot be expected that such a city's death rate could ever be made as low as those of cities in which the greater part of the population enjoys the blessings of a detached house with a little garden.

When you consider New York's crowded living conditions it seems remarkable that the infant death rate should be as low as it is. Not the least of the elements contributing to the health of New York babies is the New York City milk supply. Thanks to the fact that today this supply is wholesome and uncontaminated, many a young life is saved and many a little one is spared the unnecessary suffering of the past.

Feed Has No Relation To Garget

"What causes garget in dairy cows? Is it ever caused by feed? We have a severe case of it in our herd and we cannot see where it came from. How should garget be treated?"—L.P.H., New York.

CONTAGIOUS garget is caused by bacteria that gain entrance to the udder and multiply there. It is spread from one cow to another through the bedding or by the milker's hand or milking machine. There is no relation between feed and true garget, although of course, feeding an animal just before she freshens on heavy, heating foods, will cause serious congestion in the udder. This, however, is not true garget.

Garget should be treated by milking the affected animal frequently and throwing the milk outside the barnyard where there can be no chance of its infecting other cows. The udder can also be massaged frequently and animals can be given a laxative. If the trouble persists it is usually best to consult a good local veterinarian.

"A fine sailor you are! Doesn't anything around here look familiar?"—JUDGE.

A PROMISE MADE A PROMISE KEPT

Many years ago we made the promise of unchanging quality—stating in simple terms a policy that has always been in operation in the manufacture of Larro Feeds.

We made this pledge to our customers for two reasons—we knew it to be correct and we knew we could keep the promise.

When a dairyman or poultryman has used a feed with success, he has a right to expect exactly the same feed whenever he asks for it by name. Users of Larro Feeds know that Larro formulas do not vary—In spite of the natural variation in chemical analysis and texture of various ingredients, the special machinery used in the Larro Mill enables us to make Larro Feeds so that they are always the same in chemical analysis, texture and feeding results.

The great LARRO RESEARCH FARM is constantly studying the problems of animal nutrition—ever at work proving feeds of all kinds—testing new ideas—abreast of every new feeding theory and practice. Some day even Larro formulas may be improved. If better feeds can be made, they will bear the Larro name—until then, Larro Feeds will not change.

“Let’s you and me go *partners*”

FROM the age of six onward Man feels the need of a partner—someone to work with him, play with him, share his troubles and his success.

The need also applies to the feed business, for the successful business *must* “go partners” with its customers. Prosperous customers ensure prosperity for the firm, so the firm must co-operate by doing its utmost to insure profits for its customers.

Not only does this mean supplying a good feed, but it also means giving those “extras” of service that are so valuable.

For instance, The Park and Pollard Company maintains a Service Department for the use of its hundreds of thousands of customer-partners. Any question relating to poultry-keeping or dairying is answered by this department, which is composed of nutrition experts technically and practically trained. There is evidence to show that this service has helped to benefit the poultry and dairy industries, and consequently the firm of Park and Pollard.

Research laboratories and experimental farms under the direction of national authorities on nutrition are also maintained to advance feeds and feeding practice. Much pioneering has been accomplished—several revolutionary discoveries have been made that even now are putting more dollars into the pockets of customers.

The success of The Park and Pollard Company is a mirror of the prosperity of the countless customers who have become its partners.

Latest Developments in Vegetable Growing

State Association Holds Annual Summer Meeting at Geneva

By PAUL WORK

Professor of Vegetable Gardening

THE New York State Vegetable Growers' Association held its Annual Summer Meeting as guests of the New York State Experiment Station at Geneva on July 31. The day could not have been finer, and the central location made it possible for growers to attend from practically all of the up-state territory. At least fifteen producing centers from Albany to Silver Creek, and from Elmira to Oswego were represented by delegations and there were many from scattered points, the total attendance aggregating about 250.

The growers assembled in Jordan Hall and were warmly welcomed by Director U. P. Hedrick who referred to the early vegetable work of the first director, Dr. E. L. Sturtevant. He also pointed to the vigorous development of the station activities in this field during the past half dozen years. The staff now numbers at least eight men who are giving practically their full time to vegetable investigations and a number of others are devoting part time. New York is fortunate in having the services of the largest staff of vegetable men of any state in the Union.

The time until noon was taken up with brief reviews of investigations in progress and summaries of outstanding results. Professor C. B. Sayre who is assisted by P. V. Trap-hagen has been carrying on for four years a most extensive series of studies on fertilizers, rotations, rate of seeding, planting methods and crop improvement. This work deals with tomatoes, sweet corn, beans and

peas with special reference to canning requirements. At the same time, most of the studies are of equal interest to most growers of these crops.

Professor F. H. Hall announced the publication of the first section of the "Vegetables of New York." Three volumes similar to the "Fruits of New York" are projected and this first section deals with peas. It includes careful descriptions of practically all of the existing varieties and the more important ones receive special consideration. Beautifully colored plates illustrate the types of vines and pods. This very valuable book cannot be distributed as the ordinary bul-

letins and is available at a cost of \$2.50. A few copies are in the hands of state assemblymen and senators for distribution.

Professor Hugh Glasgow reported particularly upon the excellent progress which has been made in the control of onion maggots by means of oil sprays, using an emulsion of 2% oil at the rate of about 150 gallons per acre. Three to five applications are made and a special boom has been devised which is carried through the narrow rows by two men and is connected with any powerful spray rig. Knapsack sprayers may be used on small areas.

Mr. J. G. Horsfall spoke of the serious damage caused by the root rot and blight of peas. Special study is being made of the influence of moisture and temperature upon the severity of the disease attacks. Dry weather is especially favorable for the disease.

Professor W. O. Gloyer reported upon bean diseases and Mr. R. Cecil reported that the Mexican bean beetle has invaded the state of New York, although its damage thus far is confined to southwestern New York. It is not yet known how serious this enemy is likely to be in our state, but it has proved very serious all the way from Alabama northward.

Professor M. T. Munn told of the seed control work which is carried on in his laboratory. The tests are concerned primarily with purity of seed and are now being extended

(Continued on Page 7)

Vegetable Growing Increasing

IT is doubtful if even the vegetable growers themselves realize the extent to which their business has grown in the last few years. Even back when the census of 1919 was taken, the value of the vegetables, including potatoes, represented one-fourth of the total value of all farm crops of New York. Of course, the proportion is much greater at the present time. New York is the leading vegetable growing state; 75,000 farmers in New York produced potatoes for sale in 1919, and 35,000 produced other vegetable crops in commercial quantities. In 1928, more than \$41,000,000 worth of vegetables, including potatoes, were grown in New York.

It is a live, modern business, and its growth has been largely due to the growth of the cities and the increasing demand of city consumers for a larger amount of vegetables in their diet. Probably no class of farmers work harder than the truck growers, nor is there any class that is more progressive.

To prove this statement, one needed only to have attended the splendid meeting of the New York Vegetable Growers' Association at Geneva, July 31.

Whether you grow vegetables or not, you will like Professor Work's article on this page telling of some of the latest developments in the growing of truck crops which were brought out at the meeting.

Are You Building a Silo Next Fall?

Plan Now as to the Proper Size and the Right Materials

By I. W. DICKERSON

MANY farmers in considering the erection of a silo, think of it from the standpoint of whether or not they can afford one. It seems to me that this is wrong and that they should rather ask whether they can afford not to build a silo. It is comparatively simple matter to figure out the yearly cost of the silo, since this consists of interest on the investment, depreciation based on the number of years' service the silo will give with ordinary repairs, the cost of upkeep, the taxes, the insurance, and so on.

On the other hand, it is not so simple to work out closely the cost of the feed put in the silo as compared with commercial feeds, and of the dairy revenue lost by not having available the palatable and milk-producing feed which silage provides. It is now pretty generally admitted that no dairy farmer can afford not to have a silo, and that most feeders can increase their profits by the judicious use of silage as a part of the ration.

What Size to Build

The first question to be decided is the proper size of silo, both as to diameter and height. The diameter should be governed entirely by the number of cattle and other livestock to be fed, since at least three inches of silage must be removed each day in summer to prevent surface spoilage, while 1½ to 2 inches is sufficient in winter. Dairy cows will eat about 30 to 35 pounds of silage per day.

It is very much to be preferred to have the silo small in diameter rather than too large, and the tendency is now to build smaller silos instead of the larger diameters so common several years ago; and the dairyman with the 50-cow dairy now is likely to build two 14-foot silos, rather than one 20 feet in diameter. The

height to which the silo will be built will depend on the number of cows to be fed, their ration of silage, the length of the feeding period, and to some extent on the material used in constructing the silo.

The following table gives the sizes recommended for the 200-day winter feeding period

using 30 to 35 pounds per cow per day:

SIZE OF SILO			
Number of Cows	Tons Needed	Diameter	Height
10	34	10	27
12	40	12	24
15	56	12	30
20	66	14	28
25	80	14	32
30	100	16	30
35	116	16	34
40	121	16	36
50	152	16	40

What Kind of Silo to Build

This phase of the question is one on which there is a very wide difference of opinions, and is one which the farmer finds very hard to decide. There are so many excellent silos now on the market that the farmer should look with suspicion on anyone who tries to tell him that there is only one which he should build. Among the silos ordinarily classed as permanent because of their long service are the hollow clay tile, brick, stone, monolithic concrete, concrete block, and concrete stave; while the pressure creosoted wood stave and the metal silos should perhaps be included in this same list. All of these will give almost unlimited service if properly erected and given reasonable attention. It is very essential that all masonry silos be thoroughly and completely reinforced, since the reinforcing must take practically all the outward pressure of the settling silage. All concrete silos must be built of a rich dense concrete, preferably using one bag of cement, two cubic feet of clean sand, and three cubic feet of coarse pebbles or broken stone, with just enough water to make an easily handled but not slushy concrete. Concrete of this type will not give trouble from peeling or crumbling from the effects of the very weak acid in the silage. All built-up masonry silos must be laid in a rich cement mortar and especial care

(Continued on Page 6)

"It is now pretty generally admitted that no dairy farmer can afford NOT to have a silo..."

The Soil Makes a People

SOMEONE has said, "Tell me the kind of soil in any country or community, and I'll tell you the kind of people that live on it." When you ride into a strange farm neighborhood and find that the buildings are large and well kept, and that there is a general appearance of prosperity, you can usually figure that those farmers have an especially good soil. The capacities of barns are great, not because the owner is rich and prosperous, but rather because he and the farmers who have lived there before have been fortunate in having good soil. They need the barns to take care of the great crops that the rich ground has produced. Let several generations of people live on good land, and you will find it affects the folks themselves. They make more money, gradually raise their standards of life, and have more time for social affairs and education.

But too little is known about soils. It is said that half the apple trees are planted in the wrong kinds of soil.

These are some of the reasons why Governor Roosevelt's Agricultural Advisory Commission has recommended to the Governor that a complete soil survey of the State be made as soon as possible in every farm county, and that all of the lands be classified as to their use for agriculture and reforestation.

You will be interested in the full report of the last meeting of the Commission given on Page 5.

Dangerous and Costly Bugs

O. M. KILE, our Washington correspondent, calls attention to what the farmer is up against in his annual fight with the bugs. It does not take much imagination to picture the tragedy of the Florida citrus growers when they have lost their entire season's crop, and in some cases even their orchards, in the campaign against the terrible Mediterranean fruit fly, an insect pest which, unless controlled, will destroy the entire citrus fruit industry of America.

"But," says Mr. Kile, "the vigorous attempts to fight the Mediterranean fly have diverted attention from some of our other insect invaders, for example, the European corn borer, the Japanese beetle, and the Oriental fruit moth, all of which still march steadily onward in their work of destruction."

Take the corn borer. Ten million dollars were

spent two years ago in trying to stop its westward and southward march. But now scientists have no hope of keeping it out. The most that can be done is to keep it somewhat under control.

The Japanese beetle quarantine now includes New Jersey, Long Island, two-thirds of Delaware, and most of Pennsylvania east of the Susquehanna River. It is only a short time when this pest will be common in all the eastern half of the United States. It feeds on many different varieties of plants and fruits.

It is interesting to know that the Oriental fruit moth, another pest, the dangers from which are increasing, was first started in America from the Japanese cherry trees which were a gift from the Mikado of Japan to Mrs. Taft, the wife of the President.

The older a country grows in civilization, the more its pests and diseases of plant and animal life increase. Fortunately, however, our great army of scientists sooner or later learn how to keep them in control.

Beauty Spots of the East—Niagara Falls

THOUSANDS and thousands of tourists visit Niagara Falls and the Gorge every year. At one time it was noted for the number of honeymoon couples it attracted, but we understand that it is no longer "the style" to go there for a wedding trip.

How frequently we neglect to see those wonders that are near at hand. Tourists come across the continent to see the Falls but thousands of New York State residents may go any time, so the trip is always put off until next year. Why not plan now to see "what lies over the hill" this summer or fall?

Raining Dollars

PROBABLY nearly everyone has wished at some time that it would actually rain silver or golden dollars. If it did, silver or gold would no longer be rare and would have no value. But the rains of the past two weeks will actually put millions of dollars more into the hands of farmers, for they have saved many crops which, in some sections, could not have stood the drought very much longer.

How the weather affects us all, and particularly those who dwell in the country! Talk with a farmer after a long period of rain, when he has been waiting anxiously to get his crops in, or after a long time of drought when his crops seem likely to fail, and you will find one of the most pessimistic, despondent creatures in all the world. Meet him again when the rains are over and the sun is shining, or when the drought is ended, and you would not believe that he could be the same man.

There Should Be No Tariff on Potash

THE Federal government set out to help agriculture by increasing the tariff on strictly agricultural products. It ended by drawing a bill, now before Congress, placing so many higher tariffs on the supplies that farmers buy that, if passed, this new tariff bill will injure agriculture far more than it will help it.

A good example of what may happen with this tariff bill is the potash situation. Great quantities of potash are found in Germany. During the war, many potash industries sprang up in the United States. When the new tariff schedules were being made up in the present bill, these potash manufacturers of America began to bring pressure on Congress to put heavy duties on imported potash. Many articles have been written, and much dust has been thrown, trying to prove that the German potash industry is a great trust, determined to obtain exorbitant prices for potash from American farmers, and that therefore this so-called trust should be cut out of the United States by a heavy tariff duty.

We hold no brief for the German potash in-

dustry, but we fail to see any common sense in the argument that a higher tariff on potash would mean lower prices to American farmers. Exactly the reverse would hold. Higher tariff always means higher prices to the consumers, and the chief reason why American manufacturers want a tariff is to cut out competition and keep prices up.

As to the Germans keeping prices up at present, consider the fact that during the past five years the average price of muriate of potash was \$32.61 a ton, delivered in bags at Atlantic and Gulf ports. This is approximately \$5 less than the average of the five years preceding the war.

Pasture Improvement Needed

DAIRYMEN in this section are turning to pasture improvement as one means of cutting down production costs. As John Abbott of the National Fertilizer Association recently said, "Dairymen have been continually urged to feed more during the short pasture season and at the same time many authorities are apparently convinced that dairymen cannot afford to buy fertilizer to put on pastures."

As yet, it is impossible to make a definite recommendation that will fit all sections of the country. A considerable number of experiments have been done and it is safe to say that poor pasture is due to a lack of fertility or a lack of lime. For years, cattle were allowed to run on pastures and nothing was added in the way of plant food. The result has been a gradual decrease in fertility until many of the best pasture grasses will no longer grow.

One of the first things that can be done is to fence cows out of land which is so poor that it can never be made into a profitable pasture and grow trees on this land. Our second suggestion is to get in touch with your Farm Bureau Agent to determine whether tests have been made in your own county and if so, just what treatment has given best results. The majority of pastures in the New York milk shed undoubtedly need lime. In some cases, superphosphate may give excellent results, but in general, there seems to be a feeling that on most farms a complete fertilizer is necessary. Mr. Abbott has secured some excellent results on his farm near Bellows Falls, Vermont, by the use of lime and a fairly heavy application of the complete fertilizer analyzing 5-10-10.—H.L.C.

Let Us Work Together

"The longer I read AMERICAN AGRICULTURIST the better I like it, especially for the reason that it does not condemn everything and everybody."—L.R.

WE happened to run across the above statement in a January issue of AMERICAN AGRICULTURIST printed way back in 1893, more than thirty-six years ago.

As this has always been the policy of the "Old Reliable" so will it always continue to be, at least while the present administration has anything to say about it. Agriculture is a many-sided business with many problems, and there is enough for everyone to do without tearing down the work of somebody else who may be working differently but toward the same end.

Eastman's Chestnut

COMMISSIONER BERNE A. PYRKE of the New York State Department of Agriculture and Markets was telling me of an experience he had the other day that is good enough to pass on. He does not often get shaved by a barber, but a short time ago he was in a hurry and went into a shop for a shave. During the process, he became rather nervous and called the barber's attention to the fact that his hand was shaking, and that he certainly was not doing a very efficient job.

"Maybe that's so," agreed the barber. "I was out on a wild party last night, and you're only the second man I've shaved this morning. The first one I couldn't even see!"

Roosevelt's Commission Recommends Survey

Asks for Studies of Land, Soils and Farm Resources of New York

GOVERNOR ROOSEVELT'S Agricultural Advisory Commission is busy again. It will be remembered that it was largely through the work of this Commission, cooperating with the New York legislature, that so much important and helpful farm legislation was passed last winter.

Since the close of the legislature, the Commission has held no sessions, in order not to interfere with the work of its members, most of whom are farmers. But it will not be many months now before another legislative session will begin and the Commission is determined to be prepared by planning carefully a further program of legislation beneficial to agriculture, the rural districts, and the whole state.

We Should Know More About Our Soils

The Commission feels that one of the first things to be done is to complete a soil survey of the State. A knowledge of the kinds of soils in every county and every neighborhood and on every farm is necessary for farm success. For example, it is said that more than half of the orchards of Western New York are planted on the wrong kinds of soils. If a knowledge of these soils had been available through a soil survey, one member of the Commission, who is a fruit grower, stated, it would have saved fruit growers of Western New York millions of dollars. With the increasing specialization in crop growing, it is becoming more necessary than ever before to know the types of soils in each community and what crops they are best adapted to grow.

As many of our readers know, soil surveys have been going on for a number of years, and have been completed in the last ten years in Tompkins, Cayuga, Genesee, Herkimer, Columbia, St. Lawrence, Suffolk and Nassau Counties. Surveys are being taken at the present time in Erie and Delaware Counties. At the present rate, however, soil surveys in all of the farm counties of the State will not be completed for thirty years, which is a little late for most of us to make use of! It takes as long as five years under the present plan to get the completed soil maps from the United States Department of Agriculture after the completion of the county survey.

Surveys are conducted by the State College of Agriculture in cooperation with the United States Department of Agriculture, and the Commission plans to recommend an increased State appropriation whereby the soil surveys can be completed within the next few years. This work must be speeded up.

Farmers Use the Information

When the survey is being made it is planned also to get the present crops that are growing in each locality and on the different types of soils. All of which information will be mapped and put in bulletins and made available to the farmers of each county when the survey is completed. Such bulletins are available in most of the counties where surveys have been finished, and hundreds of farmers make use of these bulletins and information in planning their crops.

In connection with the full soil survey, special studies will also be made of the present uses and adaptations of land and crop yields on each soil type, to include:

- a-survey of soils and climatic conditions suitable for orcharding,
- b-survey of climatic conditions suitable for vegetable crops, and

c-survey of New York pastures.

In the study of orchard soils, it is necessary to make excavations in order to find out about conditions both of the surface soils and also of the sub-soils down to where the tree roots extend.

Vegetable Crops Increasing

Few persons realize the great increase in the growth of vegetable crops in the last few years, and in this business of vegetable growing, it is especially necessary to have a knowledge of soil types and conditions.

The value of the vegetables produced on the farms of New York in the last census year, 1919, represented one-fourth of the total value of all farm crops, and the proportion is probably much greater at the present time. New York leads in the production of vegetables, including potatoes, and grows about one-twelfth of all the vegetables produced in the United States. Way back in 1919, when we had our last figures, there were 75,000 farmers who produced potatoes for sale, and 35,000 in New York State who produced other vegetable crops. Hence the need of some wise planning for the future development of this particular kind of farm business.

Pastures Need More Attention

Little needs to be said in this great dairy state of the importance of our pastures. Every dairyman realizes that we know too little about them. There are 7,403,000 acres in pasture land. What kinds of grasses grow on these pastures in each county and in each community? Can other better pasture grasses be substituted? In general, how best can these pastures be improved? What greater part can the pastures of New York be made to play in the great dairy industry of the State?

These, and many others, are the questions we need to know how to answer.

Next to soil, the most important factor in the growth and yield of crops is the weather. Possibly it is even more important than soils. No matter how much care a man may give to his crops, or how many acres he may plant to them, too much or too little rain has often upset all of his calculations.

We cannot change the weather, but we can know a lot more about it and its effects on our crops. The Gov-

ernor's Commission advises that steps should be taken to assemble and analyze all available weather data and to develop new information wherever possible. These data about the weather which are now available have been gathered from only about ten points in the State, and are far from being enough for much assistance in crop planting or estimating.

Where Are the Forest Lands?

The Commission proposes that in all the counties where there is a large amount of waste land, such land be surveyed and classified as suitable for forests, for residential purposes, and for recreation. There has been a good deal of talk and some legislation on reforestation of the waste lands of the State, but there is little detailed knowledge of where this land is, what its boundaries are, and what kinds of trees should be planted on it for the best returns.

It is recommended also that an inventory of the forest resources of New York State be taken. One of the results of such a study would be to furnish a balanced plan for the annual yield of local wood lots for wood and lumber consuming industries. This would assure the farm wood lot owner a dependable market for his forest crop.

In 1929, a survey of the wood using industries of Broome, Chemung and Tioga Counties was carried out, and it was found that there were sixty-six wood using industries in the three counties using a total of 90,000,000 board feet of lumber annually. Of this, only a little over 10,000,000 board feet of local lumber were used, while at the same time 30,000,000 board feet of locally grown lumber were shipped out of these counties. These wood using industries signified their willingness to use 20,000,000 board feet of locally grown material in 1929, if it were offered them.

A forest resource inventory would show how much the local wood lands could furnish for the local demand without over-draining the timber resources.

Commission Getting Prepared

This brief report will give you some idea of the careful study that the Governor's Commission is making and of the great details it is going into on all questions that it takes up before any recommendations for legislation are made.

It should be remembered that agri-

culture is going through a great revolution. Never have there been so many changes in farming in the same period as in the last twenty-five years. These changes will continue at least for the next few years. In order to meet them, it is necessary for farmers to consider as never before the fundamentals of their business.

These are the reasons why the Commission feels the need of having a careful survey of the lands and soils of the State completed as soon as possible and all of them classified properly for their use in agriculture, for forests, and other purposes. Then, after such studies and surveys are made, the information will be printed and made available to farmers with proper recommendations.

To Study Cost of Producing Milk

Another subject considered by the Commission on August 2nd was the need of knowing more about the costs of producing milk in different regions of the State. This connects up some what with the studies of pastures. Some sections are naturally adapted to producing winter milk. Others, where pastures are good, can produce milk cheaper in the summer time. But too little is known about the details and the costs of producing milk under these various conditions and in different sections, so the Commission is recommending that a careful study of this milk producing cost problem be made immediately.

A resolution was also passed recommending that every item on the agricultural schedule of the next Federal Census be tabulated by townships for New York State. This is considered necessary in order to get working and scientific information not only for counties and states as a whole but for practically every locality. For example, a county may have little dairying as a county, but in that county there may be one township where dairying is the chief industry. This fact should be recorded and available.

The Governor's Commission will meet again at Geneva, New York, on September 19th, when the work of the Geneva Experiment Station will be given careful study, and then later in the fall an important meeting will be held at Albany for the purpose of considering plans of making electric power and light more easily available to New York State farmers.

As stated above, it is planned to get many of these problems worked out before the legislature meets this next winter so that any new laws asked for will be based on a thorough knowledge of the real needs of farmers and rural districts.

Those Attending the Meeting

Members of the Governor's Commission who attended the Ithaca meeting were: Henry Morgenthau, Jr., Fish-kill, New York, chairman of Commission; Assemblyman D. P. Witter, Berkshire, New York, chairman, Assembly Committee on Agriculture; Senator Seabury Mastick, Pleasantville, New York, chairman, Senate Committee on Taxation; M. C. Burritt, Hilton, New York, Master Farmer; Senator Leigh Kirkland, Randolph, New York, chairman, Senate Committee on Agriculture; Director Martha Van Rensselaer, Ithaca, New York, director of College of Home Economics; Jared Van Wageningen, Jr., Lawyersville, New York, Farmer; C. R. White, Ionia, New York, president, New York State Federation of Farm Bureaus; J. Roe Stevenson, Cayuga, New York, Master Farmer; Assistant Commissioner Norgood, Albany, New York, representing Commissioner Berne A. Pyrke, New York State Department of Agriculture; Mrs. Eliza Keates Young, Milton, New York, president, New York State Federation of Home Bureaus; C. W. Halliday, North Chatham, New York, secretary, Sheffield Producers' Cooperative As-

(Continued on Page 14)

My Favorite Poem

ONE of our friends who listens in every Thursday at noon to the selections of poems prepared by E. R. Eastman, editor of AMERICAN AGRICULTURIST, and broadcast over station WGY, asked that her favorite poem, "Crossing the Bar", by Alfred Lord Tennyson, be broadcast.

We take pleasure in printing it below and will broadcast it later. Nothing more beautiful or more comforting has ever been written.

Please remember that we are glad to have your favorite poems and songs, not written by yourself, and all that we have room for will be published here and broadcast over the General Electric Company's station, WGY, at Schenectady at noon on Thursday.

Crossing the Bar

Sunset and evening star,
And one clear call for me!
And may there be no moaning of the bar,
When I put out to sea.

But such a tide as moving seems asleep,
Too full for sound and foam,
When that which drew from out the boundless deep
Turns again home.

Twilight and evening bell
And after that the dark,
And may there be no sadness of farewell,
When I embark;

For tho' from out our bourne of Time and Place
The flood may bear me far,
I hope to see my Pilot face to face
When I have crossed the bar.

With the A. A. Dairyman

Fertilizing Pastures

FOR ten years or more the National Fertilizer Association has made a practice of holding regional "Fertilizer Salesmen's Schools" to familiarize fertilizer salesmen with the latest scientific developments relative to the use of fertilizer. Usually these schools are held at some experiment station; but this year the New England school furnished an innovation, the salesmen, in place of going to an experiment station, are being taken on an automobile tour to inspect and study eleven pasture topdressing tests on working dairy farms in the Connecticut valley within a radius of 50 miles of White River Junction, Vermont. There were on the trip 28 fertilizer men, 10 experiment station and agricultural college men, 5 county agents and three representatives of the National Fertilizer Association.

The pasture top-dressing tests which were visited, which were initiated by representatives of the fertilizer industry in the first place and which are being carried on with the cooperation of the county agents, were all laid out and treated according to the following standard plan:

Plot 1	phosphoric acid
Plot 2	lime and phosphoric acid
Plot 3	lime, phosphoric acid and potash
Plot 4	lime, nitrogen, phosphoric acid and potash
Check	no treatment

The amounts used supply 50 pounds of actual nitrogen, 100 pounds each of phosphoric acid and potash and 2000 pounds of hydrated lime or equivalent per acre, making the complete fertilizer treatment of plot 4 equivalent to 1000 pounds per acre of 5-10-10 analysis.

In each case a portion of each plot is fenced off to prevent grazing and permit observation of the growth and determination of yields. Yields are being determined by clipping small areas four to six times during the season so as to simulate pasture conditions rather than hay conditions. Final yields, of course, were not available; but in order to give some idea as to the trend of results square yard areas were harvested and weighed up green at the first four demonstrations visited with the following results:

	Check	No. 4, LNPK (Lime, Nitrogen, Phosphorus, Potash)
H. Armstrong, White River Jct.	11 oz.	56 oz.
Fred Howard, E. Thetford, Vt.	3 oz.	33 oz.
Frank Putnam, Bethel, Vt.	16 oz.	36 oz.
Gordon LaBounty, Randolph, Vt.	17 oz.	46 oz.

County Agent Soule reported that he made the first harvest of four tests rather early when the grass had made a big start on the complete fertilizer plot No.4 but not elsewhere and got an average yield of 2 oz. from the check plots as compared with 24 oz. from the No. 4 plot with complete fertilizer. It was pointed out that this early start permits turning the cows out a couple of weeks earlier and saves just that much barn feeding which goes a long way to pay for the cost of the fertilizer. In this connection it was repeatedly emphasized that, in the case of the milking herd, fertilizer is competing with manger feeding rather than with cheap land since sufficient cheap land is seldom available within working distance of the stable. Fertilizer may not be able to compete with cheap land as a means of providing feed for young stock and dry stock but it certainly is able to compete successfully with manger feeding of silage, green feed, hay, etc.

Complete Fertilizers Gave Best Results

The second day of the trip was largely a repetition of the first so far as results were concerned. In general, neither superphosphate alone nor superphosphate and lime appear to

have produced pasturage of sufficiently high quality for a milking herd, superphosphate lime and potash have brought in tremendously increased amounts of white clover and the complete fertilizer has, as might be expected, produced far more striking results. Of course it has cost more money; but in view of the barn feeding saved by the extra early and extra good pasturage there seems to be a good chance that it will prove the most profitable in many cases.

However, final conclusions are not to be drawn from such a short period of experimentation. The tests are to be carried on for at least a couple of years more and it is confidently expected that they will contribute substantially to our knowledge of pasture treatment.

In the case of the last test visited, that of H. F. and G. H. O'Brien of Rockingham, Vt., Mr. Abbott reported that he had determined hay yields, green weight, with the following results:

	Pounds Green Weight per A.
Check	2420
P (Phosphorus)	5740
LP (Lime, Phosphorus)	8575
LPK (Lime, Phosphorus, Potassium)	12402
LNPK (Lime, Nitrogen, Phosphorus, Potassium)	15730

In the case of this test, which was undertaken in 1928 and only the nitrogen reported in 1929, every treatment was giving results. On the other hand a test on Mr. Abbott's own farm less than a mile away showed little or no response from either P or LP but a very satisfactory response from LPK and LNPK though it was started the same day as the O'Brien test.

If any conclusion is to be drawn at present it is that lime and complete fertilizer, if applied early in the spring on a good sod and soil may be depended upon to give a big growth response practically every time; but that omitting any part of the treatment can be advised only on the basis of a local test.

Are You Building a Silo Next Fall?

(Continued from Page 3)

must be taken that the vertical joints are completely filled with mortar and well pointed inside and out. Most of the complaint about this type of silo has come from neglect of the vertical joints.

The various types of untreated wood silos give excellent satisfaction when properly erected of good materials. Although they can not be classed as permanent, they will, with proper attention and upkeep, give service for many years and are usually less expensive than the more permanent types.

Claims are often made that silage will freeze less in wooden silos than in the masonry types, and there is no doubt some difference; but my observation has been that freezing occurs mostly from above, and that if the silo is kept tightly closed at the top, the silage kept pulled away from the wall and rounded in the center, and some covering be kept over the exposed surface, that the difference in freezing among the different silos will be scarcely noticeable.

Hence the best silo for any particular farmer to select will depend very much on what material is most reasonable in price in his particular locality, depending largely on freight rates and the location of manufacturers, and how much he wishes to put into his silo.

Tests show that Griton alfalfa is more winter-hardy than the best common alfalfa and produces, on an average, three-quarters of a ton an acre each year more than common alfalfa.

Latest Developments in Vegetable Growing

(Continued from Page 3)

to include trueness to type and germination.

E. R. Eastman, editor of American Agriculturist, in a brief word of greeting, told the group that probably more than any other class of farmers vegetable growers had fitted their business to market demands. Living close to the cities, they have learned from experience what all farmers must soon learn to survive, and that is to give the consumer what he wants when he wants it.

The visitors enjoyed picnic lunch on the Station grounds and then visited the greenhouses where a new hothouse cucumber has been developed and which does not require pollination by bees. This cucumber is similar to the Abundance and Deltus in size and shape, but is of somewhat lighter color. Absence of pollination by bees does not affect the shape as with most varieties.

Visit the Geneva Experiments

The party also witnessed demonstrations of the onion spray equipment mentioned above and of dusting machinery for the Mexican bean beetle. A new device for applying corrosive sublimate to cabbage plants was also shown. This consists of a tank mounted on a wheelbarrow with a siphon outlet which permits rapid work.

The party next turned to the variety trials under the guidance of F. H. Hall and L. R. Hawthorn. Some 450 samples of tomatoes are under test along with 170 peppers, 96 carrots and also samples of several other vegetables. Part of this work was found next to Jordan Hall and part near the Oak Corners Farm.

The Best Fertilizer

The visitors found considerable interest in the extensive layout of experiments on the canning crops farm. Professor Sayre has achieved very clear-cut results in a number of directions and many of the differences were quite conspicuous in the plats. The highest net returns for cabbage and tomatoes were realized with 1200 pounds per acre of a 4-16-4 fertilizer; 600 pounds was the most practical for snap beans and beets; with sweet corn 300 pounds and 150 pounds for peas. One of the most interesting features was a series of experiments concerned with the application of fertilizers to tomato plants in the flats prior to field setting. Single elements—nitrogen, phosphorus and potash—did not give as good results as the same composted soil without fertilizer, but all three together yielded decided improvement in hastening the development and growth of the plant in the field.

It is true that wrinkled peas may be planted as early as the ground can be worked just as is usual with smooth seeded varieties. Delay in planting reduces yields. Five bushels of seed per acre is the best rate of planting where the seed is drilled as is usual for canning crops. Peas, and particularly beans, are seriously injured if fertilizer is drilled in with the seed. Separate applications of fertilizer just before planting increases yields.

Golden Bantam corn planted in hills with 30-inch spacing and 4 plants per hill is best. In drills, 8-inch spacing gave the best return. Evergreen gave better results in hills 3 feet apart each way and 4 plants per hill.

Tomatoes, as grown for cannery, using usually 100 per flat should not be started too early. March 25 gave better results than March 10 or April 10. Tomatoes have not suffered when grown on the same land four years continuously, but peas were a total failure the third year and thereafter.

The growers were deeply impressed with the comprehensiveness of the work at Geneva and with the clear-cut results which are being achieved. Growers may write to the Station for bulletins and mimeographs on the various topics which are being studied.

Vegetables that are not good when they leave the field are never any better. It does not pay to put poor vegetables on the market for they lower the price of the whole shipment.

Meet August Perils

The lowest milk production of the year comes this month. Flies are worrying the cows, heat saps their vitality and dried up grass deprives them of milk-making food material.

Cool off your cows with Purina Bulky-Las. It is made to keep cows cool and

in condition. Keep them milking with Purina Cow Chow. It furnishes the food materials needed to make milk.

Reviewing the Latest Eastern Markets

The following are the August prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk.....	3.37	3.17
2 Fluid Cream.....		2.10
2A Fluid Cream.....	2.26	
2B Cond. Milk.....		
Soft Cheese.....	2.51	
3 Evap. Cond.....		
Milk Powder.....		1.95
Hard Cheese.....	2.25	
4 Butter and American cheese, Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Prices Unchanged

CREAMERY SALTED	Aug. 9, 1929	Aug. 1, 1929	Last Year
Higher than extra....	44 -44 1/2	44 -44 1/2	47 1/4 -47 3/4
Extra (92sc).....	43 1/2 -	43 1/2 -	46 3/4 -
J4-91 score.....	39 -43	39 -43	42 3/4 -46 1/2
Lower G'ds.....	38 -38 1/2	38 -38 3/4	40 -42 1/2

There has been no material change in the butter market since last week. On the 6th and 7th business was so sluggish that it was deemed advisable to lower the price on creamery extras to 43c, in order to move some butter.

Market Reports Daily by Radio

Up-to-the minute market information and prices are broadcast daily for your benefit by American Agriculturist co-operating with the New York State and Federal Departments of Agriculture, through station WEAJ. The reports are broadcast at 12:30 standard time.

This circumstance was due to a combination of heavy posted receipts, declines in the West and sluggish trading in New York. The decrease stimulated business, for there was some renewed speculative buying on the part of those who had not already put away sufficient stock this summer and to whom the present rates appeared attractive. However, as soon as this buying interest became evident prices were soon bid up to the original mark of 43 1/2c which again caused a recurrence of quiet conditions.

Advices indicate that there is continued shrinkage in production. This week supplies have not shown any decrease but if the situation continues as it is at this writing we are going to have less butter in New York next week, providing, of course, butter from other markets is not diverted here. At the present time we are getting too much butter for the trade and the pressure is to sell. The heavy cold storage holdings are working against the market. On August 2, the four cities reported 62,433,990 pounds, while on the same day last year those same cities reported 50,617,357 pounds.

Cheese Market Shows Increasing Firmness

STATE FLATS	Aug. 9, 1929	Aug. 1, 1929	Last Year

Held Av'ge.....			

The trend of the New York cheese market is to a firmer position. Western advices are quite firm with a very limited quantity of stock being offered. There is a rather limited amount of business being done in fresh State cheese but due to the fact that the supply is rather limited prices are holding. During the recent hot spell a number of factories shut down due to the increased demand for market milk. Factories have been opening and closing intermittently which has interfered with steady production. However, the market is not calling for a great deal of cheese which keeps the price level fairly uniform.

The cold storage situation is a great deal better than it was a few months ago. On August 1, we had in storage 18,816,000 pounds of cheese in the ten

cities making daily reports. On the same day a year ago the same cities reported 15,893,000 pounds. Furthermore, the into storage movement shows a decrease compared with last year giving us a little brighter outlook.

Cooler Weather Helps Egg Market

The break in the heat wave did a lot for the egg market. It relieved the pressure to sell. Temperatures were such that it was possible to hold eggs on the floor of the stores for a while without suffering deterioration. Average extras and higher grades have sold better and gained in price holding a slight advantage over prices of a year ago. When we get below these medium and top grades however, there is a lot of pressure to sell and a great many eggs are looking for buyers. Although the top grades are moving more freely receivers are not inclined to ask higher prices being anxious to clear receipts as closely as possible. If the present situation continues we look for another advance. At this writing the trend is upward.

The egg situation as a whole is bright. On August 2, the ten cities making daily reports had on hand 4,802,000 cases of eggs, whereas on the same day a year ago the same cities reported 5,465,000 cases.

Live Fowls Lower; Broilers Higher

Live fowls are just a shade cheaper than they were last week. Sentiment has held the market down and earlier in the week things were pretty blue. The Jewish people are celebrating a fast and it appears that we were going to have too much poultry. However, it was not as bad as we first expected and the market held fairly firm. Broilers are increasing very rapidly in supply and average qualities are experiencing pressure to sell. Leghorns are doing particularly well and fancy colored stock is higher. Those fellows who are shipping in small, scabby stock are taking an awful lot of punishment these days, for the prices realized on some birds hardly pay for transportation and selling commission.

Fruits and Vegetables

Early variety basket apples steadily increased from the Hudson Valley during the week. Good quality large sized fruit met a ready sale with the tone of the market steady. Clapps Favorite pears were in more plentiful supply and values tended lower on ordinary quality and medium to small sized fruit, in a weak market at the close of the week. The season on all varieties of berries and cherries is fast drawing to a close.

APPLES—Hudson Valley: Duchess, Wealthy & Wm. Reds—per bushel basket, U. S. Grade No. 1 2 1/2 inch and upward \$2.25-2.75, 2 1/4 inch \$1.75-2.25, 2 inch \$1.25-1.75; unclassified, various sizes ranged from \$1.00-1.75; various other kinds of apples of U. S. No. 1 2 1/2 inch and upward \$1.50-2.50, and ungraded fruit \$1.00-1.75.

PEARS—Hudson Valley: Clapps Favorite, per bushel basket, fancy pack, best \$2.75-3.00, few fancy large \$3.25-3.50, fair quality, medium to small size \$2.00-2.50, poor \$1.50-1.75; per 12 and 14 quart 75c-1.25.

String bean prices except on strictly fancy tender offerings, declined toward the latter part of the week. Arrivals were liberal from numerous upstate points.

Western New York new crop cabbage made its season's first appearance during the week and found a prompt outlet. The undertone of the market was strong. Cut beets and carrots were higher. Upstate New York green peas and cauliflower were sharply competed against by shipped in stock from Washington and Colorado. Prices were lower at the end of the week. Little activity prevailed throughout the week on celery either in the rough or bunched. Scattering lots of rough celery have commenced to arrive from Oswego County and carlots from the Western part of the State. Cucumbers and pickles advanced in prices, especially on attractive quality offerings. Big Boston lettuce and romaine prices slumped during the latter part of the week. Supplies were liberal and the demand was rather slow. Spinach held steady on fancy quality. Tomatoes increased in volume and improved in quality from the Hudson Valley district. The local market, however, was in a chaotic condition at the close of the week due to liberal supplies, particularly from New Jersey. The demand was insufficient to absorb these offerings and in consequence the price obtained was of less importance than that of finding buyers. Mushrooms steadily advanced in price this week. Receipts were light. State onions of all kinds were in light receipt. Trading, nevertheless, was slow in a dull and weak market. Prices tended downward.

Farm News from New York

Milk Dealers and Cooperatives Object to Philadelphia Price Plan

EDITOR'S NOTE:—In our August 3rd issue, we reported a meeting of milk dealers and representatives of cooperative organizations with Dr. Shirley W. Wynne, health commissioner of New York City, when Dr. Wynne outlined his suggested plan for changing or modifying the present classified plan on which milk dealers are paid for their milk in the New York milk shed.

Dr. Wynne suggested that certain features of the Philadelphia "Basic Surplus" plan might work in this territory and help to prevent the present milk shortages in November by equalizing production. The Philadelphia plan is a basic surplus plan whereby dairymen are paid prices for the entire year based on their production during the short periods of the year.

Dr. Wynne's plan also included some other features, one of which was to require all milk dealers to show the Health Department contracts indicating where they were going to get all of their milk for the entire year. This, in the opinion of Dr. Wynne, would prevent price cutting during surplus times and bootlegging of milk and cream during the short periods.

Western Threat Still With Us

At the meeting on July 24, the producers' and dealers' representatives were asked to return on August 6 and make a report on Dr. Wynne's suggestions. On August 6 the producers' organizations and milk dealers were represented in a meeting in Dr. Wynne's office, and made the report which we give below.

After this report was read, Dr. Wynne said that of course it made no difference to him what prices were paid to farmers or how they were paid, but it did make a difference as to whether New York City had enough good milk at all times. "Therefore," said the Commissioner, "if we do not get enough milk and cream next November, I shall make plans to approve western plants and bring in whatever supplies are needed, and these plants will be approved on a permanent basis."

The producers' and dealers' committee told the Commissioner that they had been doing their best to get farmers to increase their supplies and that they would give further study to plans for equalizing production, or at least increasing production during the short periods, and would make a further report to the Health Department.

Here is their report objecting to Dr. Wynne's suggestion for another plan of establishing prices for producers:

Committee Report to Dr. Wynne

As a result of the meeting held in your office on Wednesday, July 24, 1929, in the course of which you discussed the present method of arriving at price and ultimate financial returns to dairy farmers for milk produced by them in the New York milk shed, at the same time indicating how certain changes might be made in that plan, your Committee respectfully submits the following report:—

In its studies and deliberations your Committee has been guided by the thoughts expressed by you that you wished it to consider a plan of purchase for the New York milk shed that would create in advance a price that the producer would receive for the quantity of milk that he produced each month of the year equal to his average production during the fall months and that for such excess production over the quantity produced in the fall the producer would receive surplus price as determined by the value of manufactured products. You stated that you believed such a plan would stimulate fall production and minimize spring and early summer surplus, and you asked the Committee to consider details and to report to you whether such a plan could be devised and put into practical and satisfactory operation in the New York milk shed.

Your Committee has, therefore, studied all of the features of what are known in the dairy industry as "basic-

surplus" plans of milk purchase, and inasmuch as Philadelphia uses a basic-surplus plan, that includes in its operations those features described by you, your Committee has studied the operation of the Philadelphia basic-surplus plan, particularly from the standpoint of its possible application in the New York milk shed and New York milk market, as well as its effect on the producers in this shed and its ability to meet New York City's peculiar and unusual requirements.

Hear Users of "Basic-Surplus" Plan

Believing that a change in methods of purchasing milk would have an effect on the financial returns of producers and that the producers' ability to adjust his monthly and seasonal production to the proposed plan are matters of paramount importance, your Committee invited directors and executives of the two largest producers associations to appear before the Committee so as to express their views as to the ability of their members to meet the proposed conditions and their willingness to accept the provisions of a basic-surplus plan (such as the Philadelphia plan) in this milk shed. The dairymen represented by these executives and directors number approximately 42,000 producers in the case of one organization, and approximately 12,000 producers in the case of the second organization, or a total of 54,000 which is approximately 80% of the dairies under New York City Board of Health inspection.

In addition the Committee interviewed an official of a large Philadelphia distributing company, who has been closely identified with the operation of the basic-surplus plan in that territory for a number of years. Your Committee has also studied bulletins, reports, etc., of the Pennsylvania State Agriculture College and the Interstate Milk Producers Association, covering the operation of the basic plan in the Philadelphia shed. As a result of information gathered from all of the above sources the following facts are developed:

Summary of Findings

One: The "basic-surplus" plan, while apparently well adapted to the producing conditions of the Philadelphia shed is not adapted to the climatic and abundant pasture conditions of New York's wide-spread milk shed.

Two: Cities in which basic-surplus plans are in operation do not depend on their own milk shed to produce their entire requirements. Cream may be imported from distant points and, if necessary, milk for ice cream purposes or in times of extreme summer shortage for general fluid purposes. New York City insists that its entire supply of fresh dairy products come from its normal inspected production area.

Three: In the New York milk shed, there is a considerable variation in climatic, mean temperature and soil conditions. This makes it economical in the northern areas to produce summer milk and in the southern areas to produce winter milk. Each section of the State has regulated its production of milk so as to take maximum advantage of its climatic and pasture conditions. The adoption of a basic-surplus plan would stimulate dairymen to try to produce milk in the fall and winter months, which in many portions of this milk shed is economically unsound.

Danger of Summer Shortage

Four: Under the basic-surplus plan there is considerable danger of a fall and winter surplus and a summer shortage of milk. Surplus production cannot be economically disposed of in the fall and winter through the manufacturing channels. The summer shortage would be a very serious situation for the city to meet. On the other hand, the presence of a reasonable amount of surplus during the summer months is desirable for it enables the City to meet unusually heavy demands during

the summer season brought about by extreme weather conditions.

Five: Under the basic-surplus plan, the producer would still be uncertain as to the exact price he will receive for all of his milk. No producer can tell in advance how much milk he will make, and under the basic-surplus plan he is only assured of the price that he will receive for that portion of his milk equal to his fall production.

Six: Prior to the formation of the two large dairy cooperatives the price was fixed six months in advance and farmers knew in advance what they were to receive for their milk. This plan was not satisfactory to the farmers, and sometimes not to the distributors and, as a result of this dissatisfaction, the present plan was evolved and put into operation by the farmers themselves.

Seven: Under the present classified plan, the value of the various dairy products is readily established and stabilized. The introduction of a basic-surplus plan would tend to upset existing values for a considerable period of time, thereby resulting in uncertainty and unrest among producers and distributors.

Reject "Basic-Surplus" Idea

Eight: All available evidence appears to indicate that the classified plan of purchase is functioning satisfactorily in this territory and that the merits of this plan are gradually becoming more generally recognized. In the opinion of your Committee, this would indicate that the classified plan which provides for the best outlet in harmony with marketing conditions for all milk produced in this market at all times of the year, is the plan best adapted to the varying climatic conditions and abundant pastures of this milk shed as well as for New York City's policy of having all milk consumed here produced within its own inspected area.

Conclusion: While your Committee has taken into consideration all of the factors and possible effects of a basic-surplus plan, it has been influenced particularly in reaching its final conclusion by the probable effect of a basic-surplus plan upon the welfare and ultimate financial returns to the producers as a whole in this milk shed, feeling that no plan can permanently succeed unless it promises to and actually does improve the producers' situation.

Your Committee, therefore, wishes to report to you that, in their opinion, a basic-surplus plan is not sufficiently suitable to this territory to encourage its adoption as a plan of purchasing milk for the New York milk shed.

Holstein Association to Celebrate First Holstein Record

THE New York Holstein-Friesian Association is certainly going to have a big day at its picnic and field day at Peterboro, New York, on August 17. The occasion is the dedication of a boulder erected by the New York Holstein-Friesian Association, marking the birthplace of the first Holstein female registered in the first published Herd Book of this breed, and also commemorating the first yearly record of milk production ever made, completed in the Miller herd in 1871.

MANY flocks run at large during the summer with little nutriment to be found. The birds cannot get enough to maintain production and fall way below a normal summer decline.

The hand of the most successful poultryman that I know never quivers when it reaches for the feed in August. He knows that summer feeding pays—both in more summer eggs and a better conditioned bird for the fall lay.

Bull-Brand Feeds Guaranteed

Birds kept on B-B Laying Mash and B-B Scratch Feeds throughout the year maintain the most economical production. In summer, as at all times, Bull-Brand Feeds are guaranteed most productive per dollar of feed cost, or your money back. Maritime Milling Co., Inc., Buffalo, N. Y.

POTTSTOWN, PENNSYLVANIA

The Farm Woman Becomes a Cateress

It is Hard Work But Work Which She Can Do and Be at Home Most of the Time

THE family finances were at a low ebb and I went about my work thinking and planning for some way to earn money. A farm woman has little time, or opportunity for making money, and my tired brain kept revolving plan after plan to no avail.

A friend of mine who entertains a great deal was calling on me and during the conversation spoke of planning

Often I provide the cream too which makes a market for farm products.

Frequently I prepare food at home for parties where the hostess serves the meal herself. I bake cake, pies or almost any article of food on order. Recently I made sandwiches and assorted cakes for a big afternoon tea at the clubhouse on a nearby golf course.

I wear white cotton dresses, made apron style with reversible fronts, white stockings and comfortable shoes with low broad heels. I never wash dishes, nor do I wait on the table, and when the meal is over I leave.

For my services, I receive a dollar an hour; when I began to work fifteen years ago, I charged half that price. The food I prepare at home is charged for by a schedule which I have worked

paring their special dishes, while I make plans for the corn custard and lemon pie—my specials. Early Tuesday morning the ladies come to our house, and together how soon we have a bushel—more or less—of potatoes peeled.

The long table is set, covered with an oilcloth of light pattern, dishes neatly placed. Big dishes of cottage cheese, pickles and fruit butter, and pats of golden butter.

Literally quarts of coffee, iced tea, milk or lemonade are consumed at each meal.

The menu will also include roast beef and gravy, with the noodles made by Mrs. Jones. Cold boiled ham, with hard boiled eggs arranged around the platter—not too much work, but make the dishes look pretty is our motto. A part

have but not such a great variety as Grandmother used to have.—M.F.M., Ark.

Pictures You Want To See

He has difficulty in keeping his identity a secret and many more difficulties also but they are finally all overcome. (Saturday Evening Post story by Lucian Cary).

The Important Ensemble

2873

ENSEMBLE SUIT NO. 2873 is delightfully modish and practical for general wear. The coat can be used with separate dresses, and blouses of different colors also add variety to the wardrobe. The blouse has a V-shaped neck trimmed with applied bands and a tie and is gathered into a hip-band which allows it to be worn as overblouse or tuck-in. The skirt is pressed into all-around box-pleats and is attached to a bodice. The suit cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 6 1/4 yards of 40-inch plaid material with 1 1/4 yards of 40-inch plain and 5/8 yard of 40-inch contrasting with 3/8 yard of 32-inch material for camisole. PRICE 13c.

a party and remarked "Sometimes I think I will go to a tea room for the luncheon, it is so impossible to get good help. If I could only do that sort of thing as easily as you do!" I was amazed to hear myself calmly saying, "How would you like to hire me to serve your luncheon?" I had crossed my Rubicon, and was soon busily planning the menu and making arrangements as though I had been catering for years. This luncheon was succeeded by others, and my business was firmly established.

Rarely I am away from home more than one day at a time and my work at home has never suffered. After the menu is planned I decide what I can prepare at home the day before. This is done and if the party is a luncheon, I go about nine a. m. to my customer's house. Of course, this depends largely on the menu. For instance, a menu such as this: fruit cocktail or bouillon, creamed chicken in patty shells, Saratoga potatoes, gelatine salad, rolls and nut bread, ice cream and angel food, the chicken would be cooked, the rolls ready for the oven or baked to be reheated, salad made, patty shells baked at home, also the cake and bread.

Geraniums Red—What a Cheerful Note They Add

559

NO. 559 NINE WAX TRANSFERS 25c

This design is for curtains only, but such clever curtains as they are! Any kitchen that can accommodate a note of geranium red—and what kitchen can not—should welcome these cheery blooming plants against the windows. Leaves and organdie facing are

green with blue pots and a black finishing line. The pattern provides 3 pats to a sash curtain, or you might prefer 2 on each side in pairs. One might be used for a glass door. In any case there are plenty as the pattern number 559 provides 9 transfers and instructions for 25 cents. They measure 8 and 9 1/2 inches each. These designs can be had stamped on excellent quality crisp white material, in 1 1/6 yard lengths as number 559B for \$1.40 a pair, or on full length (2 yards) at \$2.00 per pair postpaid. Both orders include thread to work. Order from Embroidery Dept., American Agriculturist, 461 Fourth Ave., New York City.

out; angel foods are seventy-five cents, a large layer cake is one dollar, cup cakes fifty cents a dozen and I bake them in paper cups and ice them, rolls are thirty cents a dozen for parkerhouse, twenty-five for clover leaf. My prices are not low, my products are good and I am not in the business for pleasure. If people want them, they are willing to pay my rate. I am always busy. Occasionally I am asked to serve a party in my own home. My house is large and I have plenty of silver and dishes to serve sixteen to twenty. More than that, the hostess supplies what I lack.

The work is hard and is at times a strain upon one's nerves—but the pay is ample and gives me a great deal of time at home. If you have the ability to cook and want to earn some extra money, my advice is: Go into the catering business.—C.C., N.Y.

Cooperation At Harvest Time

"I AM expecting them Tuesday for dinner". The call for help is sent over the country telephone wire to three of my good neighbor friends. Mrs. Jones can make the best noodles, Mrs. Brown the best baked beans and tomatoes, and Mrs. Cook lovely hot slaw and biscuits.

Each one at once gets busy doing all at home that they can toward pre-

of the potatoes will be set aside to be warmed up for supper as a few men usually stay. The rest will be mashed and made light as a feather by adding boiled milk to them, and beating well.

A big dish of creamed carrots, another of peas, with dishes of baked beans that Mrs. Brown has brought from her home. Mrs. Cook has prepared her biscuit mixture all ready to add the sour milk, before she came over. The pie crust is flaky, the lemon filling just right, topped by the delicately browned meringue.

When the last man and boy have finished we ladies take our time about eating, and then the dish washing.

Then the pilgrimage to the machine. Sooner or later one of us brave ones with ask, "What did it make"? Oh, how we hope for a good yield. Or perhaps it is the silo we are filling, then we say, "Doesn't the silage smell good enough to eat"?

Soon each lady returns to her own home and makes preparations for the following day. Thus we four work together, making it easier for all of us, and in a way having pleasure out of the harvest time. Perhaps it takes two days at our house, and only one at Cook's. Then we furnish more, trying always to have the expense where it should be.

One beauty of this club is that we all went together and bought the long oilcloth for the table, and use it only on special occasions. Our menus are varied, a large supply of what we do

Youthful Lines

2915

DRESS NO. 2915 is ideal for the smart-looking junior. The slightly molded bodice and flaring skirt with raised waistline give very stylish lines to this frock. Printed cottons and linens in the darker colors will be used until really cool weather and furnish very desirable materials for school wear. This pattern cuts in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1 1/2 yards of 39-inch material with 3/8 yard of 39-inch contrasting. PRICE 13c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the new fall fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Ave., New York City.

Aunt Janet's Counsel Corner

True Culture Goes Much Deeper than Merely Attractive Surface Finish

I HAVE heard people ask "What is the difference between the cultured and the uncultured, anyway?" If we try to analyze and find what makes the difference, we may get in rather deep water. Perhaps it is the ability to use fine words, perhaps not. It may be the ability to put oneself in the other fellow's place. But that may be

he has plenty of means, his dress is most inexpensive and even verges towards shabbiness. He is growing old in years, yet he is just as active as ever in searching for new truths and new facts concerning his beloved natural history. Because of the store of information which he has and his feeling of reverence for all that God has created, besides his ability to meet people on their own ground in an easy manner, I would certainly call him one of the world's most cultured people.—AUNT JANET.

ROMPER B5211 comes ready-made in fine white suiting, stamped for simple, colorful embroidery. Floss included for working. May be had in one or two year size. Price 65c. Address Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

merely a good imagination. Some may think that the ability to wear good clothes well constitutes real culture; certainly no one would question that the ability to appear tidy and pressed, even in the poorest of fabrics, is no mean part of a cultured person's habits.

Perhaps it all comes down to the good old fashioned rule of doing unto others as we would have them do unto us. This and some other attributes added to these very fundamental qualities go far towards making up what we call a cultured personality.

But one of the most cultured people whom I have ever met is a man who might be considered by the thoughtless to be a little "queer." I call him cultured because he has so many interests and knows a great deal about so many things. To walk with him through the woods or on the beach and hear his familiar and affectionate way of referring to the birds, the flowers and all of nature's miracles is like a glimpse into another world. He knows them not only by their com-

Tested Recipes

Olive Salad

Dissolve one package of lemon gelatin, pour into boiling water, stir well and set aside until it begins to set. Chop one cupful of celery, one and one-half cupfuls of nut meats and two sweet cucumber pickles. Cut six hard-cooked eggs and one cupful pimento olives in slices and drop into the gelatin. Turn into molds and chill. Just before serving arrange on lettuce leaves and add a dressing made of equal parts of mayonnaise and whipped cream.—L.M.T.

This is a sweetish salad and should be served for occasions which call for such a salad. It would not go well with a heavy meal which needs a certain amount of acidity to relieve its heaviness. It is light and dainty and would be good for club meeting or for other affairs of that nature.

Erin Potatoes

Pare, cook and mash six medium sized potatoes. Remove seeds and veins and parboil one large green pepper. Chop pepper with one tablespoonful parsley. Blend thoroughly with the mashed potato, garnish with sprigs of parsley and serve.—L.M.T.

Mashed potatoes should be seasoned with hot milk and melted butter or cream. It is well to remember that whatever is added to mashed potatoes should be added hot or it will make them heavy. Hot water may be added if milk is scarce but in this case butter should be used to supply the lacking food value.

Ripe Pear Salad

Cut very ripe pears in half and remove core. Arrange on individual nests of lettuce leaves and fill the hollows with grated cheese. Let stand an hour, dress with mayonnaise and garnish

beets in bottom of casserole, pour the milk over them, sprinkle top with bread crumbs and bake in quick oven.

The egg and milk combined with beets would furnish the main dish of a summertime meal. Since beets are rather insipid in flavor it is always well to supply what is lacking in the form of pickles or seasonings.

Some of Betty's Letters

SOME of our little friends have been sending orders for scrapbooks without their names and addresses signed. If you have ordered a scrapbook and it failed to arrive, be sure to send a card, giving your full name and address, so that a scrapbook may be sent. Address Betty, c/o American Agriculturist, 461 Fourth Ave., New York City.

Dear Betty—I enclose 10c in stamps

Graceful Circular Skirt

2908

DRESS PATTERN NO. 2908 with the graceful circular skirt and modish collar is charming for general wear when made up in the pretty printed silks to be found everywhere. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 3/4 yards of 39-inch material with 3/8 yard of 32-inch contrasting. PRICE 13c.

for the little cooks' scrapbook. I am teaching my little sister to cook and I think your pages are a wonderful help.

This issue has lesson number three in it. It is the only one I can find now as some of my friends borrowed the others. They won't get any more of these pages, you may be sure. I will take them out the first thing.

My father has taken American Agriculturist for a good many years and I always enjoy it. It has so many good things for the homemaker and now your department is best of all, Betty.

I will close with best wishes for the little cooks.—Your truly, C.C., N.Y.

Dear Betty—Enclosed is the coupon and stamp. We take the American Agriculturist and have taken it for years. I want one of your scrapbooks because I want to learn to cook. We have 65 chickens and 75 ducks and I also have two little kitties and a little Guernsey calf. I am 9 years old.—Yours truly, B.U., N.Y.

SCARF DESIGNS NOS. C161, C162 and C163 are very attractive and come stamped on superior quality oyster white linen. Size 18x45 inches. Price 60c. Address Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

mon everyday names, but by their botanical names as well. And what is more important, he knows their habits and from year to year can look forward to the pleasure of meeting these wonders of nature again. His sympathy and understanding of the human heart are just as deep as for the smaller marvels of nature. He is kindness itself, and not even a stray dog would need to fear harshness from this man. He has helped a great many boys through college and yet there is never from him the least indication that he is doing anything unusual. Although

with a thin slice of lemon and bits of shredded parsley.—L.M.T.

If you lack the ripe pears this same suggestion will apply to canned halves of pears.

Carolina Beets

Wash and boil young beets, being careful not to break the outer skin. Let cool in water in which they were cooked, pare and dice. To one pint of sweet milk, add three beaten eggs, one half teaspoonful salt and half as much pepper. Put three cupfuls of the diced

Here's washday wisdom . . .

First Save Yourself!

On washday . . . it pays to *save yourself!* And Fels-Naptha shows you how. It gives you, not more soap, but more help! The extra help of two active cleaners, in a single golden bar. Naptha, the dirt-loosener (smell it!), and good golden soap, the dirt-remover. Working together, they make your washing easier. Buy Fels-Naptha today...at your grocer's.

When Writing Advertisers, Be Sure to Mention American Agriculturist

The Plains of Abraham—By James Oliver Curwood

His father was there to care for his mother, a new home could be built, the world did not end because a house burned. But there were two fires—and the other farther on, reflecting itself dimly and yet more sombrely, was the one that terrified him. It was Hepsibah's fire talking to him through the night!

Then the choking thing in him gave way, and as the power to act returned, he saw Odd facing the lighted heavens—and in every muscle and line of the dog's rigid frame the Indian sign was clearly written. Until now this admonition had never sent through him a thrill of dread or fear.

He set off at a run down the hill, and as he ran bushes whipped at his face and shadows gathered under his feet and long arms of gloom reached out from among the trees to hold him back. When he came to the bottom he ran faster, and so thick and dark were the walls of the forest about him that they hid the radiance in the sky. Silvery threads of starlight illumined his way, and he darted through splashes and pools of it and crossed opens where it swallowed him in cobwebby seas. He could not come up with Odd. Like two shadows in a playful night, one closely pursuing the other, they ran until Jeems's breath began to break from his lips in gasps, and at the end of a mile he fell back to a walk. Odd lessened his pace to his master's. They climbed a lower hill, and once more Jeems could see the glow of fire. In the upper vault of the sky it was fading to a ghostly pallor against the sweeping arc of the Milky Way.

They ran on, and the spirit of hope began to fight for a place in Jeems's brain. He seized on this ray of light shining out of the darkness of shock and panic and hugged it to him eagerly. It gave life and force to the arguments with which he now made an effort to hold back the grimmer thing. His home was burning. But it must be an accident, nothing that should fill him with fright. The other fire—off in Forbidden Valley—was no more than a coincidence, probably a conflagration started by a careless Indian or a white man's pipe. The woods were dry. Windrows of fallen leaves carpeted the earth ready to catch the spark from a bit of steel, a crumb of tobacco, or a smouldering wad from a gun. He had never been afraid of forest fires!

He paused again to get his breath, and Odd stopped with him. They stood in one of the pools of starlight, their ears straining, their eyes staring, and it was the dog who held back a greater triumph of optimism. His sliaggy body was trembling with the pent-up emotions of suspense and passion which possessed him when he caught in the air the deadly poison to his nostrils—the Indian smell. The crest along his spine had stiffened. His eyes shot flame. His powerful jaws were drooling as if hunger instead of hatred were moving him. Jeems struggled not to believe the evidence which he saw, and told himself that if by any chance there were Indians at his home they were friends helping to save what they could from the tragedy of the fire.

A faint wind whispered in the tree-tops as he listened. Dry oak leaves rustled on their branches as if fleshless hands were shaking them. Then the rustling and the whispering passed, and shadows lay like solid substance on the earth. Out of the silence Jeems heard a sound which rose above the pounding of his heart. It was so far away, so indistinct, that the stirring of the leaves had kept it from his ears. The wind began to play softly among the oaks again, as if that were its intent.

But Jeems had heard.

He had heard the firing of guns.

Over the hills and forests the sound had come to him from the direction of the Tonteur seigneurie. He did not wait for the oaks to drowse again. Odd led him in their last heartbreaking race into the Big Forest. Lead-

weights seemed to be dragging at his feet before they were through it. He had run too hard. He stopped and sagged against a tree, with Odd growling in a low and terrible way close to his knees. He was not trying to prove or disprove matters now. A catastrophe had happened to his thoughts with the firing of guns. Taking the place of hope, even of his fears, was the one great desire to reach his father and mother as quickly as he could.

His exertions had beaten him when they came to the edge of the forest and he could have run no farther without falling. Before them was the slope, a

alive in him, that alone kept him from shouting at last. It was not because he was afraid. He did not fit an arrow to his bow as he walked down through the starlight, his feet travelling a little unsteadily. What was there or was not there could not be changed by an arrow. He did not screen himself in the shadows. He was looking for nothing and wanting nothing but his father and mother.

Unexpectedly, he came upon his father. Henri was on the ground near one of Catherine's rose bushes, as if asleep. But he was dead. He lay with

whispering of the leaves, an unearthly and shivering cry that sent echoes over the clearing, with grief for company.

It was this which brought Jeems out of the depths into which he had fallen. He raised his head and saw his father again, and swayed to his feet. He began seeking. Close by, near the pile of apples which she had helped him gather from under their trees on the slope, he found his mother. She, too, lay with her face to the sky. The little that was left of her unbound hair lay scattered on the earth. Her glorious beauty was gone. Starlight, caressing her gently, revealed to her boy the hideousness of her end. There, over her body, Jeems's heart broke. Odd guarded faithfully, listening to a grief that twisted at his brute soul. Then fell a greater silence. Through long hours the burning logs settled down into flattened masses of dying embers. A wind came dismally over the Big Forest. The Milky Way began to fade. Clouds gathered to shut out the stars. The darkness came which precedes the day, and after that, dawn.

Jeems rose to face his blasted world. He was no longer a youth but a living thing aged by an eternity that had passed. It was Odd who led him in the quest for Hepsibah Adams. He sought like one half blind and yet sensed everything. He saw the trampled grass, the moccasin-beaten earth at the spring, a hatchet lost in the night, and on the hatchet an English name. But he did not find his uncle.

In the same gray dawn, stirring with the wings of birds and the play of squirrels among the trees, he set out for Tonteur Manor.

He carried the hatchet, clutching it as if the wood his fingers gripped held life which might escape him. Because of this hatchet there grew in him a slow and terrible thought that had the strength of a chain. The weapon, with its short hickory handle, its worn iron blade, its battered head, might have been flesh and blood capable of receiving pain or of giving up a secret, so tenacious was the hold of his hand about it. But he did not see the iron or wood. He saw only the name which told him that the English had come with their Indians, or had sent them, as his uncle had so often said they would. The English. Not the French. *The English.*

And he held the hatchet as if it were an English throat.

But he was not thinking that. The part of him conscious of the act was working unknown to the faculties which made him move and see. His thoughts were imprisoned within stone walls, and around these walls they beat and trampled themselves, always alike, telling him the same things, until their repetition became a droning in his brain. His mother was dead—back there. His father was dead. Indians with English hatchets had killed them, and he must carry the word to Tonteur.

The whole thing was like a twilight of unreality through which he was passing, a grotesque nightmare of some kind. The rising sun did not dispel this illusion, which came and went like waves of light and darkness in his brain. Day with its warmth and beauty, the hundreds of birds gathering for their southward flights, the cheerful calling of turkeys under the chestnut trees, the soft blue in the skies all added to it. At times he almost cried out the impossibility of what had happened, and only a little less than believed that his eyes had lied to him.

After a time, the effect of these things began to give way before the steady progress of other forces in him,

(Continued on Page 14)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems apologizes to Toinette and Tonteur visits the Bulain home where he and Hepsibah have another friendly (?) battle much to Catherine's dismay.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems. Friction between the French and English grows steadily worse and there are rumors of war and massacre. One day Jeems takes a trip to Lussan's and as he returns just at dusk he finds his home on fire.

silvery carpet of the starlight. At the foot of it was what had been his home.

That it was a red-hot mass without form or stability, a pile out of which flame rose lazily, its fierceness gone, added nothing more to his shock. He had unconsciously looked for this. The barn was also a heap of blazing embers, and what remained of the smaller buildings near it glowed like the stub ends of huge candles against the earth. Everything was gone. Even this fact was not the one which began to break down his reason, which he had struggled so hard to keep. It was the stillness, the lifelessness, the lack of movement and sound that appalled him at first and then closed in about him, a crushing, deadening force. The fires lit up the bottom land. He could see the big rock at the spring. The paths between the gardens. The bird houses in the nearest oaks. The mill. A patch of sunflowers like slim-bodied nymphs. Details were there, clearly illumined, down to the little heap of cider apples which his mother and he had gathered a day or two before. But he could see nothing that had been saved from the burning house. He could not see his father or his mother or Hepsibah Adams.

Even Odd's heart seemed to break in these moments. A sound came from him that was like a sob. He was half crouching, no longer savage or vengeful. But Jeems did not see. He was trying to find some force in him that could cry out his mother's name. His lips were as dry as sticks, his throat failed to respond. The silence was terrific. In it he heard the snapping of an exploding ember, like a pistol going off. He could hear the water in the creek where it splashed over the stones near the mill. In the woods behind him an owl hooted, half subdued by the starlight. He could hear no one talking, no voices calling.

Fear, the repulsion of flesh and nerves to danger was utterly gone from him. He was impelled only by thought of his father and mother, the mystery of their silence, his desire to call out to them and to hear their voices in answer. If there was a spiritual self

his face turned to the sky. Firelight played upon him gently, now increasing, now fading, as the embers flared or died, like fitful notes in a strain of soundless music.

As softly as the light, without a sob or cry, Jeems knelt beside him.

It was strange that in this moment he could speak, while a little before that power had been choked in him by things less terrible than death. There was no hysteria in his voice. His own ears caught it as one which did not seem to come from himself. He spoke his father's name, yet knew that no answer would rise from the lifeless lips. He repeated it in an unexcitable way as his hands clutched at the silent form. As death draws near, numbing the senses and drawing a golden veil of relief over pain, it brings with it a great calm, and it was this—the mental inertness of death without its physical change—that came over Jeems. For the starlight left nothing unrevealed; his father dead, his white lips twisted, his hands clenched at his side, the top of his head naked and bleeding from the scalping knife. Jeems slumped down. He may have spoken again. He may have sobbed. But the thing like death that was creeping over him, its darkness and vastness, hid him from himself. He remained beside his father, as motionless and as still. Odd crouched near. After a little, an inch at a time, he crept to the dead man. He muzzled the hands that were growing cold. He licked Jeems's face where it had fallen against his father's shoulder. Then he was motionless again, his eyes seeking about him like balls of living flame. Death was in the air. He was breathing it. He was hearing it. It was in the mournful rustling of the oak leaves. The softly dancing shadows of the fire flung it at him. A night hawk swooping near the glow bore it with his wings. The stillness was weighted with it. At last, irresistibly impelled to answer the spirit of death, he sat back on his haunches and howled. It was not Odd's howl any more than it had been Jeems's voice speaking to his father a few moments before. It was a ghostly sound that seemed to quiet even the

The Plains of Abraham

(Continued from Page 12)

the saviours that rise or fall between madness and reason, between hysteria and calmness. He paused when he came to Squirrel Rock and looked over Forbidden Valley. With its autumn colourings it was more than ever like an Oriental tapestry laid out under his eyes, its lakes gleaming with friendliness. He could see no smoke and no sign of invasion or enmity. The song of the squirrels floated up to him. The wings of two eagles he had known since childhood flashed against the sky. His mind cleared, and he was conscious of regaining strength which he had lost. He spoke to Odd, and the dog pressed close to his knee and looked up at him with the language which he, too, had allowed to grow numb and dead for a space. Courage grew between them. When they turned away from the valley, Jeems's eyes were filled with a different light.

Thought which had been wrecked and beaten until now possessed him with a flame behind it that began to burn fiercely but which seemed to give no heat or excitement to his flesh. Only his eyes changed, until they were those of a savage, flinty in their hardness and without depth in which one might read his emotions. His face was white and passionless, with lines caught and etched upon it as if in bloodless stone. He looked at the hatchet again, and Odd heard the gasp which came from his lips. The hatchet was a voice telling him things and gloating in the story it had to tell. It made him think more clearly and pressed on him an urge for caution. He did not follow this immediately, for what lay behind made the matter of personal danger a trivial thing, not because of his courage, but because he was deadened to fear. As he drew nearer to Tonteur Manor, the instincts of self-preservation awoke in him.

Injunction Asked Against Tipster Sheet

"Do you know anything about the responsibility of The American Investor and Trader, Inc. of Jersey City, N. J.

WE understand that the American Investor and Trader, Inc. whose president is Edward Hudley and whose vice president is James P. Dolan, puts out a tipster sheet and that their methods of doing business have been subject to considerable criticism.

We are informed that the Attorney General's office at Trenton subpoenaed this firm for the purpose of ascertaining their activities in stock selling,

fairs of this company were closed up in an entirely legal manner. Anyone buying stock does so because of belief that the company will pay dividends. If the company fails to prosper and goes into bankruptcy the affairs of the company are settled up and whatever is left is paid out to the stockholders. Sometimes the stockholders get part of the money they paid in and in other cases as in this instance, no returns are secured. Unless it can be shown that there was some dishonesty in the affairs of this company our subscriber has no cause for legal action against anyone in the company. It was simply an unwise speculation rather than an investment.

Cannot Afford To Be Without Insurance

I AM writing this to thank you for the \$130 I received for thirteen weeks I was laid up from my accident but I cannot express thanks enough and I don't know how anyone can afford to go without the insurance. It was the best paying dollar I ever invested.

I will be glad to answer any letter anyone might write me in regard to the company, for they are square and all right.

Respectfully,
George W. Taylor
Castleton, Vt.
R. F. D. No. 1

but Mr. James Dolan appeared and answered the subpoena but as he did not have the information required, the hearing adjourned until a later date. At this later date, the officers of the company failed to appear and suit was started by the Attorney General's office to enjoin them from further activities until they should give the required information.

We suggest that readers beware of all market tips. Anyone who has information of value generally uses it himself. Questionable market operators who fleece the unwary call it "shearing the lamb". It is hot now but winter is coming, so don't let any one "shear" you.

A Speculation—Not An Investment

"A few years ago we bought some stock in Shore Transit Line, Inc. the ream enclosing a letter I recently received from a law firm who claims to represent them. Is it possible that they could take my money, use it and never give me anything in return? I paid them \$50. of hard-earned money for two shares. They promised me 20 per cent on the investment and I never got anything. It looks as if they were trying to beat me out of it altogether. Will you please take the matter up and see if you can get the return of the money we paid?"

THE letter enclosed reads as follows: Replying to your letter relative to the stock in Shore Transit Line, Inc. the receivership of this company was completely settled several years ago and a final distribution made to the preferred stockholders, the common stockholders receiving nothing."

It is evident from our subscriber's letter that he is not familiar with investment practices and to our way of thinking, this makes the whole matter all the more pitiful. In the first place, anyone who knows anything about investments should know that a promise of 20 per cent return immediately characterizes the investment as exceedingly speculative.

So far as we are able to see, the af-

Before You Enroll In An Aviation School

WE HAVE recently had a number of inquiries from subscribers interested in aviation, particularly as to the reliability of various flying schools.

The Rochester Better Business Bureau suggests the following steps to anyone interested along this line:

FIRST: Write to the Aeronautics Branch of the Department of Commerce, Washington, D. C., for Bulletins No. 7 and 19.

SECOND: Take the physical examination required to fly a licensed plane.

THIRD: If possible, visit the school and talk with the students.

FOURTH: Find out what guarantee there is that flight instruction will actually be given.

FIFTH: Get all the facts about the school. The Better Business Bureau can help you.

These steps are necessary since some flying schools are schools in name only and are merely interested in getting your money.

Family Trees

I am interested in genealogy and have been trying for some time to write a history of our family. I was referred to Joel Munsell's Sons, of South Norwalk, Conn. and corresponded with them. They said they had a book containing the history of our family. I wrote them that I would be glad to buy it but that if the history proved to be of some other family, that I expected to return it. They made no reply to this and assuming that they were a reliable firm, I ordered the book. I

A "Thank You" Is Our Pay

I CERTAINLY thank you very, very much for your help, as I think if you had not helped me I would have had quite a hard time to get my \$300 from the company, but with your help it all went smooth. Thank you a hundred-times.

found that the history was not of our family and now they will not accept the return of it. They offer to credit me with the price of the book toward a coat of arms of our family. I told them I would be glad to accept this offer if they would give me unquestioned evidence that it really belongs to our family.

We publish this letter for the information of our readers. Doubtless the Joel Munsell Co. can legally maintain that the sale was an out and out sale inasmuch as they did not accept in writing our subscriber's proposition that he return the book if it did not prove to be what he wanted. To date our subscriber has not heard from them in response to his offer to accept the coat of arms if unquestioned proof can be given that it belongs to his family. Perhaps it is an acknowledgment that this proof cannot be supplied.

GOOD SHELLS AT A MODERATE PRICE

SHUR SHOT SHELLS are good shells. You'd know they were good if you paid a lot more for them

Here's a load that's as fast and snappy as any you ever shot. It wins at trapshooting and brings home the game.

Shur Shot Shells are made of the best materials. Loaded with American Smokeless Powder. They have the famous Remington Battery Cup Primer and they're wet-proof throughout—top-wad, crimp, and body—by Remington's patented process. Made in 12, 16, and 20 gauge, both soft and chilled shot.

Your dealer has Shur Shot Shells, or can easily get them for you. Write for descriptive circular.

To the Man Who Owns a Cutter

IS YOUR MACHINE OUT OF DATE?

Nowadays, a machine doesn't have to wear out to become unprofitable. It may be just out-of-date.

Your ensilage cutter for instance: How does its performance compare with the 1929 Papec? Has it a Self-Feed that is really automatic, saving a man at the feed table? Is it clog-proof, saving costly hold-ups with men and teams standing idle? Will it operate to capacity when pulled by an ordinary light tractor? Will it fill the highest silo in your neighborhood without a complaint? Quite likely, a New Papec would soon pay for itself in greater efficiency and lower operating cost. At any rate, you want to keep posted on the latest improvements in cutter construction.

Write for your copy of FREE 1929 Cutter Catalog—covers improvements—filling costs—3 h. p. electric filling.

New York Fruit Growers Tour the Virginias

We Must Grow Better Apples to Meet Competition There

By M. C. BURRITT

A WONDERFULLY successful tour," "The best trip I ever had", "I wouldn't have missed it for anything", "I saw and learned so much that it will take me weeks to digest it",—these were typical expressions at the close of a twelve hundred mile automobile tour of southern Pennsylvania, the Shenandoah-Cumberland Valley of West Virginia and Virginia and the Piedmont section of Virginia, by more than four hundred New York fruit growers.

M. C. Burritt

The tour was the result of a visit of about twenty growers to Virginia in 1928 made at the invitation of Governor Byrd and repeated invitations from the Governor, college officials, growers, and the Virginia Horticultural Society. At the winter meeting of the New York Society a resolution was adopted favoring the excursion and a joint Horticultural Society-Extension Service committee was appointed, consisting of three representatives of the Society, four western New York fruit

county agents and a member of the Pomology Department at the College. After several meetings the committee sent Prof. Osgood and Roger Coombes of Monroe County south to go over the entire proposed trip and plan its details. Upon their return a detailed schedule was published and widely distributed. The response was immediate and beyond the committee's expectations. Three hundred fifty people registered for the tour. At one time on the tour more than one hundred and twenty cars were in line, carrying four hundred and fifty persons. About two hundred fifty individual growers and more than fifty women and children made the entire trip. The caravan

was more than a mile long. The expedition assembled at State College, Pennsylvania, on Monday afternoon, August 4th, and after studying orchard fertilization and cover crop experiments there on Tuesday A. M., set out to cross the mountains to the south, visiting orchards en route. We stayed at Martinsburg, W. Va., and visited West Virginia orchards all the next day. Wednesday night we were in Winchester, Va., and Thursday was spent visiting orchards in Frederick County, traveling southward up the valley and exploring the Timberville area. Spending the night in Harrisonburg on Friday, we crossed the Blue Ridge mountains from Stanton through Croset to Charlottesville, where the tour officially closed. Nearly fifty carloads went through to Washington, D. C., together on Saturday, however, to call on their fellow fruit grower, Charles S. Wilson and the Federal Farm Board and to see the capital city.

The cooperation, courtesy and interested helpfulness which we received everywhere on this trip were simply marvelous. From the Governor of Virginia to the humblest

Boy Scout who helped us find our rooms at night, everyone did his best to make our journey a success. From start to finish we had an escort of from two to five State highway police in each state we passed through. These efficient escorts cleared the traffic from our route, guarded dangerous and misleading turns where we might lose our way, arranged with local city and village police officers to give us the right of way through towns and generally delighted everyone by their attention to our needs and convenience. Local reception committees of growers and Chambers of Commerce met us, arranged for sleeping accommodations, gave us receptions and evening programs and had whole city blocks set aside and guarded for free parking. Private homes were opened to supplement hotel accommodations. College fruit specialists and county agents showed us orchards and introduced us to local growers.

We visited about twenty-five orchards in three states over a territory four hundred miles long. It was a strenuous trip but everyone seems to have had a wonderful time. Every morning we breakfasted at six o'clock and were on the road at the whistle at seven

o'clock. Practically every detail of the trip was carried out as planned. There were no accidents and no serious troubles. It was a trip long to be remembered by those who took part in it, and if they go home and spread the gospel of better fruit growing throughout the state as I believe they will, it will be an event destined to have a great influence upon the fruit industry of New York State.

What of the lessons learned? What good has the trip done those who made it? Has it been more than a sight seeing vacation? It would be hard to find a more beautiful country or to plan a more delightful excursion. But listening to the remarks of growers I am sure that it has

(Continued on Page 6)

Then and Now

WHEN we read Mr. Burritt's article about all the courtesies and hospitality extended by the people of Virginia and the Shenandoah Valley to the New York apple growers, we thought of another kind of reception given in the same section in the early sixties to "visitors" from the North.

Both Mr. Burritt and Mr. Van Wagenen have written enthusiastic articles in American Agriculturist about the beautiful Shenandoah Valley and its hospitable people. It is probably true that there is no finer orchard and farming land in the world. The Shenandoah Valley was the "granary" of the South and its great herds of cattle and horses and abundant farm crops were a big help to the South in the first years of the war, but in the latter part of the war General Grant determined to clean out the valley so that the Confederates could no longer grow provisions to feed their armies, and it became a great battleground.

General Sheridan was selected to lead the work of destruction. With 26,000 men, he went into the Valley, and, starting at Harper's Ferry on the coast and moving slowly up to the top, he drove the last armed Confederate out of the region. Sheridan slaughtered or drove off thousands of cattle and sheep, burned more than seventy grist mills, and destroyed over two thousand barns filled with hay and grain. When he had finished it is said that this once fertile region was so devastated of food supplies that not even a crow could fly through it without carrying his provisions with him.

But the war is long since over. The farms of the beautiful Shenandoah were reconstructed and have bloomed again these many years, and the old hatreds and quarrels are largely forgotten, as they should be.

STOCKAID ANIMAL SPRAY

Repels and kills flies, mosquitoes, fleas and lice... won't
irritate the skin... keeps hair nice and glossy... will
not clog sprayer. Protect livestock against insect tor-
ment... use STOCKAID, the scientific animal spray.

The Question Box

Killing Poultry Lice

What are the best remedies for destroy-
ing lice on poultry?

PROBABLY the three most common-
ly used materials, exclusive of the
commercial remedies which are also
handy and effective, are mercurial
ointment, sodium fluoride and Black
Leaf 40. Black Leaf 40 is one of the
newer materials recommended. By
the use of an oil can, a thin stream
can be put along the top of each perch
and three or four drops put into each
nest. The application is best made
just before hens go to roost. The heat
of the bodies causes the fumes to cir-
culate and kill the lice.

A small bit of mercurial ointment
can be placed beneath the vent and on
top of the head and this will be effec-
tive for some time. Sodium fluoride
is a dust. A pinch of this is put on
the head, underneath each wing, on the
inside of each thigh, below the vent
and on the breast. A single application
should be sufficient. Many poultrymen
apply some material for controlling
lice when the hens are culled due to
the fact that the hens must be hand-
led at this time and the de-lousing
process does not add much to the job.
Probably the easiest method from the
point of labor involved is the newer
method which is the Black Leaf 40
treatment.

Change in Feed Not Cause of Abortion

"One of our neighbors who is a very
good dairyman, tells me that he never
had a case of contagious abortion in his
herd until he changed his feed a year or
two ago. Since then, he has had more
trouble and many losses from abortion.
Can you tell us whether commercial
mixed feed can cause this disease?"—
L.P.H., New York.

THERE is absolutely no connection
between commercial mixed feed
and abortion. Abortion is such a pec-
uliar disease that wrong conclusions
are often reached. Animals that are
infected with the disease may abort
one year and may calve in a perfectly
normal manner the next year. On
the other hand, a herd may go along
for several years without any trouble
and then there may be a bad epi-
demic a particular year and when such
epidemic comes along a herd owner is
likely to conclude that something is
responsible but as a matter of fact,
has absolutely no relation to the
trouble. The one and only cause of
contagious abortion is a bacterium
known as bang abortion bacillus.

About Free Martins

"Will you kindly give me some infor-
mation about twin calves. I have a pair
male and female from a very good cow
and would like to raise the female
if it is all right to do so. Some people tell
me that they will not breed and should
not be raised."

IN a large per cent of the cases where
a heifer calf is born as a twin to a
bull, the heifer will not breed and for
this reason it is advised that they
should not be raised unless they are so
valuable that the owner is willing to
take a chance.

Curing a Dog of Mange

Is there any cure for mange? My dog
has just started to get it. Will you ad-
vise what to do.—M.J.N., New York.

WE referred the above inquiry to the
American Kennel Gazette, the of-
ficial publication of the American Ken-
nel Club, and following is the reply of
Dr. E. R. Blamey.

"Ordinary mange or scabies is curable.
For years I have used the following
formula with success. Precipitated sul-
phur, two ounces; oil of tar, one ounce;
sodium bicarbonate, half an ounce; crude
oil and cotton seed oil, each, eight ounces.
The lotion must be mixed thoroughly be-

fore it is used. Rub it into the skin every
second or third day and into the affected
spots daily. Keep the dog in a warm place
during treatment. Continue treatment for
about two weeks before bathing.

"Follicular mange is much more diffi-
cult to control and eradicate. I have used
ten per cent of balsam of Peru with a
base of lanoline and olive oil. This is
rubbed into the skin daily. If the disease
is accompanied by pustules it is neces-
sary to use a vaccine in addition to the
lotion."

Plant Onions Early

Our onion tops died while the onions
were still quite small. Can you tell us
the reason for this?

FROM your letter, it seems probable
that your onions were planted too
late to get the best results. It is also
possible that the fertility of your soil
is rather low for growing onions.

Personal Experience Requested

WE have recently received a number
of letters from subscribers, asking
for information on growing and selling
drug plants and also about the pos-
sibility of making profit from growing
rabbits or guinea pigs. We have been
able to get little definite information
from subscribers who have had actual
experience in making profit from any
of these enterprises.

If any of our readers have been suc-
cessful in showing a profit over a
period of years with any of them, we
would be glad to have them give their
experiences for the benefit of other
subscribers.

Nitrogen Does Not Cause Scab

Are orchards where nitrogen has been
applied more likely to be seriously dam-
aged by scab?—L. W., New York.

THERE seems to be no direct relation
between nitrogen and scab damage
but there may be an indirect relation.
In the first place, trees that have re-
ceived nitrogen have a heavy foliage
which is difficult to cover thoroughly
with spray material. At the same
time, trees with heavy foliage do not
dry out after rain as rapidly as those
with a thin foliage and there is prob-
ably a longer period in which the
leaves may become infected.

Crank Case Oil Not Recom- mended for Spray

Has any work been done toward the
use of waste crank case oil as a spray
material?—C.H., New York.

AUTHORITIES do not recommend
a crank case oil for use in spraying
due to the fact that it is so variable in
its characteristics.

Hen Health

Prevention the Only Remedy--Doctoring Does Not Pay

By H. L. COSLINE

THERE is a certain satisfaction in doctoring a sick animal; that is, if the treatment is successful. However, so far as the treatment of hens is concerned, the man who is continually doctoring his flock is less likely to attain success than is his neighbor who has few hens that require doctoring.

There are several reasons why it is often dangerous and unprofitable to try to cure hens that are suffering from disease. Their relative small size and crowded condition not only makes it difficult to pay close attention to individual hens, but also insures the rapid spread of any infectious disease that affects one hen. The individual has relatively little value, and more time may be spent with her than she is worth. The health of a flock or an individual hen depends upon two things; the vigor and vitality of the hens and the conditions which surround them.

Breed Hens for Vigor

Vigor must be bred into a flock. Here, as in all breeding operations, it is profitable to take advantage of the work done by other breeders. If your flock is continually sick, even though they are well cared for, it may be wise to start again with stock that is noted for its vitality. In breeding, vigor should be the first requirement. What use is it to breed high-producing hens if we are unable to keep them alive after they are produced?

In keeping the environment such that it will be healthful for the hens, several points must be considered. It

is doubtless true that some flocks escape serious disease without much attention to any of them, but this is no argument for their neglect. It is good insurance to pay careful attention to them. In general, men who have expanded their poultry business have found that conditions which "got by" with a few hens, would not do when a large flock was kept under similar conditions.

Perhaps housing the hens is the point which gives the most trouble. It has been my observation that as a rule the poultry house is less suited for its purpose than other building on the farm. This is in spite of the fact that often a good house could have been built for less money than was spent on the poor one. Ventilation and

freedom from moisture are the two essentials most often lacking. It is not important what system of ventilation is used so long as it works, but where moisture collects on the windows and where the litter is wet and heavy, it is sure evidence that either the ventilation is not right or moisture is finding its way into the house in greater quantities than it should. Ventilation should not be sacrificed to warmth, as is so commonly done. Birds will be healthy, and their combs will not freeze if the air is kept fresh and dry.

Kill Bacteria—Clean Thoroughly

Cleaning the house is often not thorough enough. The word clean may mean several different things. When "cleaning" hen houses, it should mean that not only is the visible dirt removed, but also the removal or killing of all bacteria. It does little good to disinfect a house before it is cleaned, because the dirt forms a protective covering for the bacteria. A thorough disinfection after cleaning, twice a year at least, is necessary. Whitewash, with a quart of crude carbolic acid for each ten gallons of whitewash is fine. Sunlight is helpful in keeping a flock healthy. Too few houses have windows and cloth curtains open on sunny days in the winter.

The feeding of the hens is the second consideration. A good ration, of which there are many, is easily supplied and is all that is necessary. When a ration proves successful it
(Continued on Page 18)

A healthy flock is alert and busy every minute of daylight—there is no cure for a sick hen except the axe.

A College Farm Education in Two Years

Cornell Offers New Opportunity to Young Farmers

By A. W. GIBSON,

Associate Secretary of the College of Agriculture
young man following one of these curricula, to prepare himself for practically any type of farming which might be found in New York State. The courses themselves will deal directly with

credit for all of the work he had satisfactorily completed as a two-year student. This is another attempt on the part of the faculty to adjust the teaching at the college to the needs of the student, and takes into account the possibility of changes in the interests of young men, which we all know are apt to take place.

Scientific Training in a Short Time

TWO-year courses in agriculture at Cornell represent an outstanding addition to the educational facilities available to young farmers of the state.

It is not necessary to have had foreign language to enter.

The courses are of college grade, and a certificate will be granted to those completing the work.

The cost is only one-half in time and money of the four-year course.

Tuition is free to residents of New York during the past year.

Work starts on September 23rd. Here is a real opportunity for boys who like farming and who want to lay a real foundation for success.

foreign language and certain other academic subjects which have heretofore been required of students. The courses are directed primarily toward fitting farm boys to become better farmers, and more useful citizens. The purpose of Dean Mann and the faculty of the College of Agriculture in setting up these courses is to make the enormous facilities of the College available to a greater number of young men in the state than ever before.

This determination to give instruction at the college level without requiring certain preparation which has long been considered necessary is an unusual departure in college administration and will be watched with interest. There is no intention of lowering the standards in these courses. In order to be admitted a boy must furnish fifteen units of credit, i. e. be a high school graduate, but there is no specification as to what these units shall be, except that they must be acceptable toward a diploma from the University of the State of New York. It is the belief that boys who have had such preparation will be qualified to carry on the work of the two-year courses with credit to themselves and to the college.

In order to save time and money for the student, selected courses have been arranged into definite courses for dairy farmers, poultry farmers, fruit growers and vegetable growers. Minor adjustments in these and well directed choice of electives, which are permitted in addition to the required work, will make it possible for a

the farmers' problems and it is felt that this two years of study will give the young man who cannot stay at the College for a longer period, the very best training that he might get in that length of time.

A Certificate For Graduation

When two years of work have been completed satisfactorily a certificate will be granted by the faculty in recognition of the student's achievement. Should a boy taking one of the two-year courses in agriculture decide that he wanted to do something which requires a four-year course and a college degree for preparation, it would be possible for him to change to the four-year course by satisfying the entrance requirements of that course and he would receive

Many young men are going to ask the question, "Who wants to be a farmer anyway and why should any young man be interested in college preparation for that occupation?" That is a very wise and natural question for young men of high school or college age to ask at the present time. Their knowledge of farming and their attitude toward it are based very largely on the farming conditions which have existed for the past eight or ten years. It is during those years that they have been old enough to observe and draw conclusions. Also during this time farming has suffered one of the

worst depressions ever known to the business and the depression has received widespread publicity. It is very difficult for a young man to look back on such conditions and see anything ahead in them for himself. If, on the contrary, the past ten years had been ones of unusual prosperity, there is no doubt but what the popular thing to do in the minds of many young people would be to become a farmer. History has shown us, however, that unusual prosperity does not continue indefinitely in any business and that, practically without exception, good times are followed by hard times; so that very likely the young man who goes into farming, or into some other business, after a continued period of prosperity is very apt to find immediately ahead of him a

A Glance at the Farm Markets

THE Bureau of Agricultural Economics of the United States Department of Agriculture has just issued a review of the farm market situation in the United States. The total acreage of crops harvested this season will be about the same as last year. The production of hard winter wheat was estimated in July of this year at 40,000,000 bushels less than it was last year at the same time. Spring wheat was also estimated at nearly 40,000,000 bushels less than last year's production. It would look now as if wheat growers will get much better prices than they first expected and, as a natural result, dairy feeds are higher in price and will probably continue to rise to some extent during the fall.

The hay crop is larger than it was last year, and in our own eastern states clover and alfalfa are particularly good. The outlook for fruit is not good. Virginia and Idaho have a promising crop of apples, but elsewhere the apple crop is below average. Peaches, pears, citrus fruits, and grapes will be decidedly smaller crops than last year. Do not be in a hurry to sell these at the first opportunity.

The market outlook for hogs is good and for poultry not so good. On July 1, it was estimated that there are ten per cent more young chickens on farms than last year. This will mean more poultry coming to market this fall and probably increased production by next spring. It is a good time to cull hens very closely.

The dairy market situation is still favorable although July butter prices are about three cents lower than they were in July 1928. Cheese prices are also lower than they were last year. There are plenty of all dairy products in storage. The market for fluid milk is strong and there may be a milk shortage this fall.

However, there are several signs to indicate that we are at about the peak of milk prices and that production will continue to increase with re-

sulting lower prices to producers. The dairyman who anticipates this situation will be the one who makes money.

Dr. E. H. Porter

OCCASIONALLY there is a public servant whose lifelong interest in the problems of farms and farmers enables him to be of unmeasured service to the cause of agriculture. Such a man was Dr. Eugene H. Porter, who has just died on his farm at Upper Lisle, New York.

Dr. Porter was very highly educated in the profession of medicine and because of his training and ability he rapidly advanced in his profession until he became New York State Commissioner of Health. Later, because of his knowledge of and sympathy with the problems of agriculture, he was appointed Commissioner of the Department of Foods and Markets. He was a director of the Dairymen's League from December 11, 1917 to December 20, 1918, just following the strenuous milk strike of 1916, and during the time when the League was making its most rapid growth, and was in need of the kind of counsel and help that Dr. Porter was best able to give. The writer well remembers his fearless and outspoken stand in the interest of the dairymen of the State. In recent years, he has lived quietly in the rural surroundings that he loved in Upper Lisle.

We join with Dr. Porter's other countless friends in expressing our sorrow in his passing.

Wise Financing

MORE than 30,000 farmer stockholders of the Grange-League-Federation Exchange in the last few days have been paid full six per cent dividends on their stock. For several years now this cooperative organization has built up a constantly growing business, accumulated large properties and a surplus and at the same time has paid regular dividends to its stockholders. It must be considerable satisfaction to farmers to have their faith in their own organization thus justified.

Wise financing is the first fundamental for cooperative success, and in this territory both the Dairymen's League Cooperative Association and the G. L. F. have succeeded in placing their finances on a safe and sound basis.

Incidentally, if you are a G. L. F. stockholder and have not received your dividend, it is probably due to some mistake in the records and we suggest that you write the main office at Ithaca, New York, about it.

Things to See at the New York State Fair

NEXT week is Fair Week for all of rural New York. As the showmen used to say: "This stupendous event will be the biggest and best yet!"

It really will. Under the direction of Berne A. Pyrke, Commissioner of Agriculture and Markets, and Director J. Dan Ackerman, the State Fair is steadily improving. The midway has been cleaned up, all of the exhibits are much better, and the whole idea of the Fair comes nearer than ever before to the ideal of what an agricultural fair should be; that is, a show of what the State is doing and can do agriculturally.

Space will not permit mention of all the exhibits which are planned for this year. Sufficient to say that, if you have a real interest in your farm business, you cannot walk through the showings of fruit and vegetables, the exhibits of poultry or cattle or of dairy products without being proud of the Empire State. Particular mention should be made of the County Farm Bureau exhibits. Do not miss them. If you are from one of the counties putting on these exhibits, you certainly will be proud of your Farm Bureau and of your county.

The American Agriculturist-Farm Bureau-

State Fair horseshoe pitching tournament will be played off on Tuesday, just across the race track under the viaduct. Comfortable seats will be provided and, judging by the number of counties that have entered contestants, you can be assured of a hot time.

One of the most interesting new programs for the State Fair will be the exhibits and events during the week at the Farm Museum. Here you will see the implements and the handicrafts of the farm and home of long ago. Here at eleven o'clock every day you can hear short addresses by famous men of the State. Every day at two o'clock an old-fashioned singing contest will be held, and of course you will not want to miss the statewide spelling contest which also will be held at the Farm Museum.

If you like band music, the brass band contest, with bands from almost every section of the State, will certainly arouse your enthusiasm. Mention should be made of, and you should see the exhibits and events by the 4-H Club boys and girls.

In fact, we urge you to attend the Fair not only for its instructive values, but especially to get a little vacation, have a good time, meet old friends that you would not otherwise see, and return with new inspiration and with a new outlook which will make the old farm look better than ever.

From Coast To Coast In Two Days

IN 1804, only one hundred and twenty-five years ago, it took Lewis and Clark, the explorers, two terrible years to go from St. Louis to Oregon and back. No longer ago than the days of the "forty-niners" it meant months of wearisome toil and danger to cross from the Mississippi to California. Even within the memory of living men it was considered absurd for the United States to own the Pacific Coast states because of the difficulty of representatives from those states to meet with Congress in Washington.

On our desk as we write today, there is a circular issued by the Pennsylvania Railroad announcing the beginning of passenger service from coast to coast in forty-eight hours, or two days—two nights on the railroad by sleeper and two days by aeroplane.

Who among the old-timers could have dreamed of such progress in transportation? Who among us of this day can foresee what will happen in the fifty years to come?

Eastman's Chestnut

IF you have ever wrestled with a foreign language in school, you will have some sympathy for the foreigner who tries to learn English. Although we take our own language for granted, it is one of the hardest of all to learn, and before we laugh too much at the mistakes of the foreigner we should remember that there are very few English speaking persons who use their own language correctly.

A friend of mine claims that the following letter was actually received from a Chinaman applying for a job:

Dear Sirs:

I am Wang. It is for my personal benefit that I am writing for a position in your honorable firm.

I have a flexible brain that will adapt itself to your business, and consequently bring good effects to your good selves. My education was impressed upon me in the Pekin University, in which place I graduated Number One, and my English is great.

My references are of the good, and should you like to see them, they will be read to you with great pleasure.

My last job has left itself from me, for the good reason that the large man has dead. It was on account of no fault of mine.

So, Honorable Sirs, what about it? If I can be of big use to you, I will arrive on same date that you should guess.

Yours faithfully,

(Signed) P. S. Wang.

Please, I Want to Play

What Some Communities Are Doing With Their School Grounds

By RALPH A. FELTON

EDITOR'S NOTE—One of the most hopeful things in connection with country life is the greater interest farm people are taking in their schools and in the educational facilities of their boys and girls. The recent rural school legislation passed in New York State, giving rural schools so much more financial help from the State, will do a lot more toward building up the rural schools without adding to the farm taxes.

In the article on the page, Professor Felton shows us what a number of farm neighborhoods are doing in making the school grounds as well as the schoolhouse a more interesting place for the boys and girls.

Professor Felton, who quite occasionally writes interesting stories for AMERICAN AGRICULTURIST, is a member of the Department of Rural Social Organization of the New York State College of Agriculture at Ithaca.

THE other day a peddler was traveling along a country road stopping at each farm home to sell his wares. He came across one of our improved rural schools. He knocked at the door and when the teacher opened it and the peddler saw the scholars inside, he said: "Please excuse lady, I thought somebody lived here".

The shrubbery, flowers, play apparatus in the yard, and curtains on the windows, made the place look like a real home instead of a school. Why not fool all the peddlers in this way?

Over in western New York State someone put a sign on the little home school house which read: "The People's College". This was not intended to be a joke. Although an increasing number of farm boys and girls are attending high school and college, yet up to the present time the majority never get beyond the rural school. Is the rural school in our home community the best that we can make it?

Every now and then some parent-teacher's association or home bureau unit starts out to improve their district school. Teachers are thinking of the school house now as not just a barn-like structure but a "school home". School trustees are seriously asking "what improvements can I make this year in our rural school?"

In Niagara County a certain trustee, a woman, with the help of the local home bureau members undertook to install complete playground equipment on the school grounds. The women did the head work, the husbands helped with the heavy lifting. Miss Laura Ray, the county Home Bureau agent, bossed the job. One of the men went to the junk pile and selected old pipe. Chain ropes were purchased. Everybody helped dig the holes. Sets of swings, see-saws, and a horizontal bar were installed. The work was done one evening after the day's work was ended in the orchards, by the help of the automobile lights. It might be a good plan to elect more women as school trustees.

What Is Community Housekeeping

In St. Lawrence County near Canton is the Old Brick Church Community which has been playing a losing game with its youth for some time. The young people who have grown up here have nearly all gone to the city. Miss Mabel Milhan, the Home Bureau Agent in this big north country has succeeded in convincing the members of this Old Brick Church home bureau that their job is "community housekeeping" as well as "nutrition and clothing". After putting on a home talent play and getting electric lights in their farm homes these women started in to improve their schools.

Many groups do not make any school improvement because they say they can't agree on which school to start. We usually have a school house about a mile and a half in every di-

rection. This group however, built play apparatus at all four of their schools. They really put into practice some of the things for which their home bureau creed stands.

The two school superintendents in Yates County probably will get the blue ribbon for unique ideas in getting school playgrounds built. They started their project last August at the Penn Yan County Fair. The County Agricultural Committee set aside Wed-

nesday, August 29th as "school day" and through the cooperation of Horton and Vann, local hardware dealers, arrangements were made with the R. A. Fife Playground Apparatus Manufacturers of Mamaroneck, New York, to install complete school play apparatus right out there on the fair grounds. The children made good use of it for three days. School teachers inspected it. Trustees picked out what they wanted. Various organizations in the county have offered prizes to the school which makes the most progress during the year in putting in new play apparatus.

District Number 9, Canandaigua, Ontario County—an example of what can be done to improve and beautify the grounds of rural schoolhouses.

An interesting story is going around in one of the Yates County communities of a little crippled girl with a weak back who finds great happiness in using one of these new swings. She is just sure the swing is making her back stronger "day by day in every way".

As a matter of fact, there is nothing better to develop the health of all kinds of children than a swing. The trunk and abdominal muscles are strengthened thereby. The children thus get out in the fresh air and sunshine. They learn team work on the

playground too, something they will greatly need later when they get big enough to be statesmen and work out a farm relief program for their country.

Other Sections Active

The pomona grange in Tompkins County is promoting a county-wide project of building school playgrounds. A committee of six, two from each school supervisor's district, has secured prizes and arranged for a demonstration playground. They expect to have a good report to make next June.

The village of Trumansburg expects to win all sweepstakes in this county contest. A "citizens committee" is

building a school playground. The Methodist minister and five other men have been running tractors, plowing and scraping and levelling the new centralized school grounds. A druggist, a doctor, a poultryman and a preacher have been working together with great enthusiasm on this committee.

Otsego and Sullivan counties are also promoting countywide projects of equipping their rural schools with play apparatus. The movement is spreading in the State in a most encouraging way, and yet there is much to be done. The Tompkins County committee discovered that 52 per cent of their rural schools have no play equipment of any kind, and that the half which have it have only expended an average of \$22.50 for it, scarcely the price of one automobile tire. Thirty-five dollars will buy a two-swing outfit made of galvanized pipe with chain suspensions and ballbearing clamps. Thirty-one dollars will pay for a two-board see-saw. Fifty dollars will provide for a slide. The State College of Agriculture will provide, without expense, plans and prices for any rural school in the State.

"Where are we going to get the money?" someone asks who is interested in buying such play apparatus. The school trustee can help. Tell him you want it. The last time you discussed school matters with him, you remember, was when you complained about how much money he was spending. We can buy play equipment for twelve rural schools for what it costs us in taxes to keep one boy in a reform school for one year.

The grange, the home bureau, the parent-teacher's association are each greatly interested in community work. A new swing at the school will not cost them as much as that last oyster supper cost and will make your grandchildren healthy and happy long after you have attended your last grange social.

"What if some child should get hurt on the new playground?" someone asks. The only way to be very sure that children won't get hurt is not to have any children. But I have been studying this question of rural school playgrounds in New York State for five years and have yet to hear of a single child being seriously hurt on any play apparatus. But I have heard of a great many who were run over by automobiles while playing in the road and streets. Play apparatus on the school grounds keeps children off the roads which as we all know are getting more dangerous each year.

When we cease to be interested in the play of children it is a sure sign we're getting old. Let us demonstrate our youth. The right to play is as fundamental to a child as the right to go to school. Let us give our children a properly equipped playground.

A Game to Play—Farmer and Turkey

THIS is a good game for parties where there are twenty or thirty guests. Have them form in lines of five or six, and hold hands across the lines. When the leader blows a whistle or gives some other sharp signal, each person makes a sudden quarter turn to the right and takes hold of his new neighbors' hands. A farmer and a turkey are chosen, it being the business of the farmer to chase the turkey, of course. The turkey is given a bit of a start, and the farmer is after him, running up and down the constantly changing streets and alleys formed by the turning lines. When the turkey is caught, he chooses a new turkey and the farmer chooses a new farmer, the leader being careful to fill up the gaps made in the lines so that no breaks are made in the streets or alleys. The farmer must not break through or tag through a line.

My Favorite Poem

FOLLOWING our suggestion that you might like to send in your favorite poem and have it broadcast over station WGY at Schenectady, and published in AMERICAN AGRICULTURIST, several have said that one of their favorites was "In Flanders Fields", written by Colonel John D. McCrae. It is a real piece of literature destined to go down through the years not only because it is well written but also for the reason that it is a reminder to all of us to remember the sacrifices which the soldiers have made.

Do not forget to listen in every Thursday noon to the series of "Visits with the Poets of the Farm and Home" prepared by E. R. Eastman, editor of AMERICAN AGRICULTURIST, and broadcast over station WGY.

In Flanders Fields

*In Flanders field the poppies blow
Between the crosses, row on row,
That mark our place; and in the sky
The larks, still bravely singing, fly,
Scarce heard amidst the guns below.*

*We are the dead. Short days ago
We lived, felt dawn, saw sunset glow,
Loved and were loved, and now we lie
In Flanders field.*

*Take up our quarrel with the foe!
To you, from failing hands, we throw
The torch. Be yours to hold it high!
If thee break faith with us who die
We shall not sleep, though poppies grow
In Flanders field.*

New York Fruit Growers Tour the Virginias

(Continued from Page 1)

been an inspiration to better fruit growing. Local pride has been aroused. Comparisons have been made, not all of which are favorable and every grower must have been stimulated to better endeavors in growing, packing and marketing.

At the conclusion of the tour at a final banquet at Charlottesville, Dr. Heinicke, Dr. Parrott and the writer, after talking with many growers, attempted to summarize some of the outstanding facts learned. The points brought out in this summary will be of interest to all New York fruit growers.

1. New York will be faced with increasing competition from the entire Shenandoah-Cumberland region as its younger plantings come into heavy bearing. Approximately two-thirds of the trees in this region are under 18 years of age and one-third are not yet in bearing. There are very few orchards too old to be profitably productive as yet.
2. The spraying practices of the region are good but probably no better than New York's best. We learned that the growers generally stick closely to liquid lime sulphur and arsenate of lead, supplementing with Bordeaux for local reasons. They spare no expense in putting in efficient equipment and their coverage in gallons applied per tree is generally greater than ours. Although they have nearly all the insects and diseases that we have and some bad ones besides—e.g. cedar rust and sooty blotch—their fruit is generally of high quality this year.

Humus Is Necessary

3. The fertilization and cover crop practices of the best growers and as demonstrated by experiments suggest that New York growers may have neglected to keep up a sufficient supply of humus in the soil and that many of our orchards may be suffering from a lack of organic matter and fertilizers, particularly nitrates. There is an intimate relation between the two.
4. Location of the orchard is of vital importance. In the Shenandoah region it is the right site for air drainage. In New York it is soil and water drainage. Our competitors have learned the lesson of poorly located orchards and are replacing them on better sites. New York growers must do the same with regard to soils.

5. In the Virginias there is concentration on a few leading varieties. York Imperial is the leader, comparing very favorably with our Baldwin. Ben Davis and Stayman Winesap follow, though Bens are limited to local areas. Delicious is prominent. There are a few Northwestern Greenings in the northern part. Nearly every orchard has a few Grimes but this variety is not extensively planted. In the Piedmont, Albemarle Pippins are important. The old Winesap, the Lowry and the Black Twig are found. But the average grower does not grow more than three or four varieties, at the outside. Commercially New York must come to this same practice.

Orchards Are Larger

6. There are fewer but much larger growers. Plantings range from ten to fifteen acres in the smaller orchards up to four, five and even six hundred acres. This makes educational work in cultural practices, grading and packing much simpler and easier. It also makes it possible for the buyer to secure large quantities of a uniform quality with much less trouble and this fact, more than any other is driving buyers from New York to this region. Cooperative packing houses are a necessity for New York. Very few cars of mixed fruit are shipped.
7. A good grading and packing law is being well enforced and shipping point inspection is being generally

used. The quality of the pack is steadily improving.

Cooperation More Important Here

8. Although there is little cooperative packing and still less cooperative selling, the sentiment for it is growing and the time is not far distant when this region will be working together as a solid unit. Cooperative grading, packing, advertising and selling is more important in New York than here because of the larger number of small orchards. In Western New York particularly it is a necessary development.

Finally, it is a quite general conclusion that New York fruit growing at its best has nothing to fear from its southern competitors. New York has as good varieties, better soils, as safe locations, vastly superior highways and transportation, is nearer to markets, and has more favorable freight rates. But its growers are not generally as wide awake and progressive. Our fruit industry *at its worst*—even below its average—is doomed. It cannot survive the competition facing it. Our progressive growers willing to do their best and to work together cooperatively are not discouraged, but encouraged by what they have seen this week.

Removing Undesirable Apple Trees

What is the most economical method of removing old trees from the orchard?—C.E.R., New York.

ALTHOUGH apple trees do not make a very much firewood, it is possible to remove at least a few every year and at least get what wood there is. It is impossible, of course, to take out stumps without considerable expense. Dynamite is very efficient, but where an entire orchard is taken out in this method, it becomes rather expensive. Probably as good a way as any is to cut them off close to the ground and let the stumps rot. If new trees are to be set, it will be necessary to plant them a little out of line with the old trees, but after all, this is not a serious disadvantage.

Lime to Prevent Spray Injury

How much lime is recommended with a spray to prevent burning?—M.R.D., New York.

FREQUENTLY from 5 to 10 lbs. of hydrated lime, to 100 gals. of spray material, is recommended to prevent spray injury, but at the same time it is pointed out that this lime reduces the efficiency of the spray against apple scab.

Contact Spray for Aphids

Why is it so difficult to control the leaf hopper on apple trees?—C.W.L., New York.

THIS is a pest which must be killed by a contact spray material. At the same time, the pest is fairly active and although a good job of spraying may be done which kills all of the hoppers on the trees they quickly come from other trees and reinfest the orchard. Probably the best treatment is to spray with nicotine in the calyx spray.

Pear Varieties for New York

What varieties of pears are recommended for the commercial New York orchard?—R.L., New York.

IT is probable that Bartlett is still the best variety followed in order by Seckle, Bosc and Anjou. Pears should be cross pollinated for the best results. Seckle is not good for pollinating Bartlett. Some new varieties that give promise are Cayuga, Gorham, Phelps and Pulteney.

To Kill Poultry Lice—Just Paint it on the Roosts!

No matter how big the flock or how lousy, only a small paint brush and a can of "Black Leaf 40" are needed to rid a flock of lice.

Does Away With Individual Handling
Old laborious and disagreeable methods of dusting, dipping or greasing are eliminated. No longer necessary to disturb the birds.

Treat Whole Flock In a Few Minutes
Simply "paint" "Black Leaf 40" on top of roosts. When birds go to roost, fumes are slowly released, penetrating the feathers and killing the lice. "Black Leaf 40" is sold by poultry supply dealers, druggists, hardware and seed stores, etc. The \$1.25 size treats 100 feet of roost. Ask your dealer.

Tobacco By-Products & Chemical Corp., Inc., Louisville, Ky.

No Matter Which Way Your Corn Crop Goes

the Unadilla will make the most out of it! If it matures—you're in luck. Put it in a Unadilla and make the best winter milk-producing feed. If your corn doesn't mature—if it freezes or grows infested with the corn borer—put it in a Unadilla—its sort of ensiling means certain death to the European pest. Insure your crops' use and profitability by putting them in a Unadilla—the strongest, easiest to erect and safest silo made.

Send for illustrated catalog and price list. Immediate shipment in all sizes of Oregon Fir and Spruce. Big discount for cash on delivery. Payments on time if wanted.

How Long Should Cows Rest?

I had an argument the other day with a neighbor who claimed that four weeks between lactation periods was long enough for any cow. In fact he said he had a cow or two that he could not dry off. What is the right period of rest?—H. L., New York.

THE average rest in good dairying practice for a mature cow is from six to eight weeks. If a cow is in poor condition, she ought to have at least eight weeks. A heifer also should have eight weeks. A cow that is given no rest period as your friend suggests may not show it for a year or two but she will over a longer period and would have been a better producer if she had not been crowded quite so hard.

Heifers should be milked a full year the first time and then given an eight weeks' rest. This influences their later lactation period. Cows, not heifers, should drop a calf every year.

How to Dry Off Cows

I have two or three cows that I cannot dry off. Does it do any harm to milk them up to calving time? How can I dry them off?—L. C., Pennsylvania.

THE simplest way to dry a cow off is to cut down on her feed but this must be done carefully and gradually. All grain may be cut out gradually and some times it is possible to change the quality of the roughage, as for instance, from clover or alfalfa to poor timothy hay. If the cow is out to pasture, she may be kept in for a short time and fed on hay. Begin by milking her once a day, then once in two days, then only once in five or six days. Keep close watch of the udder.

Feeding Dairy Goats

IT is unfair to compare the doe fed on good healthy rations with those which are forced for high milk production. She will raise better kids, maintain a higher degree of vitality and remain immune to many of the dreaded diseases to which she would otherwise be subjected.

There is little doubt that the average goat breeder has been unable to give as close attention to the feeding problems as he should, which is due to a number of reasons. First, the intensified production of goat milk is practically a new venture in most parts of the country, and but few experiments have been conducted by the state experiment stations. Second, a large number of experienced and successful goat breeders have not kept accurate records of the feeds given their goats or the milk produced. Third, many breeders do not realize that keeping goats in yards is an unnatural condition for goats and do not supply their animals with a sufficient amount of milk-making elements to produce an increased flow of milk.

If a doe is fed only enough protein for three quarts of milk, and enough fats and carbohydrates for six quarts, she will give only three quarts, or draw on her body reserve for whatever more she gives. Stimulated with an undue proportion of proteins she will give more milk at the expense of her health and vitality.

Need Balanced Rations

Goats under natural or wild conditions are enabled by their instinct to select such food materials and in such combinations as to serve their needs perfectly. Growth, maintenance and milk production are thus provided for, and under normal conditions, nature's arrangements are such as to satisfy the needs of wild creatures.

Domesticated goats are, however, wholly dependant upon the provision which man makes for their wants. The environment is radically changed from that of their wild progenitors; their instincts are also probably less reliable than were their ancestors. Moreover, they are required under

civilized conditions, to perform functions vastly changed in kind and in degree from those of their wild ancestors. The problem of feeding to meet these greatly changed conditions has become one of great complexity.

It is plain to even a novice in feeding problems, that for the proper nutrition of animals maintaining such large yields of milk, corresponding quantities of food material must be provided and that these materials must be appropriate in quality as well. In other words, milk can not be produced out of air and water. As milk contains protein, fat and mineral matter, the milking animal must take these into her body before she can make milk of them. V. M. C.

Vitamins in the Dairy Business

What is all this talk about vitamins? It is very important talk. Enough is known about vitamins in both the human and animal diet to make us realize that they are essential to life and growth.

Vitamin A is the one that occurs in butter fat and in animal fat. It occurs in green forage and leafy roughage and is also found in yellow corn. When Vitamin A is absent from the diet, it affects the growth and the body is more likely to get disease.

Vitamin B is found in milk and grains, in green forage and in roots. Because it is more abundant than Vitamin A, little attention has to be paid to it.

Vitamin C prevents scurvy in human beings and in certain animals. This vitamin occurs in leafy foods and in green forage and to some extent in milk. It is said that it is not particularly important to the health of dairy animals.

There are several other very important vitamins. The important thing to remember about all of them is that most vitamins are present in large quantities in milk and other dairy products. Thus, those who use large quantities of dairy products will be quite sure of getting a good supply of vitamins are more plentiful in leafy roughage so that cattle are more likely to get them under pasture conditions. It is said that dairy products have more vitamins in summer time than they do in winter. This may also be due to the cows being out in the sunlight. Direct sunlight has a great influence on the health of all animals including the human being.

High, Medium and Low Protein Feeds

I hear a good deal of talk about high, low and medium protein feeds. What are the feeds in the different classes?—R. W., New York.

A HIGH protein feed is one that contains 23% or more. Among the high protein feeds are: Cottonseed meal, Linseed oil meal, Distillers dried grains, Gluten feed, Gluten meal, Buckwheat middlings.

Medium protein feeds contain from 12% to 23% of protein. These include: Barley feed, Wheat mixed feed, Standard wheat middlings, Coconut oil meal, Wheat bran.

The low protein feeds contain less than 12% of protein. They include: Ground buckwheat, Ground rye, Corn feed meal, Ground barley, Ground oats, Corn meal, Hominy feed.

There is a tendency among the best feeders to use more medium protein feeds and less high protein feeds. This will cut down the cost of the ration and seems to give as good results.

It is very fortunate that there are many different feeds in each class because this enables the manufacturer to vary the mixture when some of the protein feeds become too high priced.

Champion Spark Plugs
excel and outsell
throughout the world

It is a fact that Champion Spark Plugs keep the vast majority of the motor cars of the world running.

In the realm of business few indeed are the American products which enjoy this proud privilege of outselling all others throughout the world.

No matter what the business, or product, you may rest assured that if it has merited a universal preference, it is because it has deserved it; because it is a better product.

There is a very real significance in the fact that Champion Spark Plugs outsell throughout the world. A significance that is part and parcel of a never varying formula which directly concerns the material, design, manufacture and ultimate performance of Champion Spark Plugs. For the unity of purpose which dominates Champion has always been expressed in an uncompromising search for better material, better design, better manufacture and better ultimate performance.

You can buy Champion Spark Plugs with every assurance of superior performance and dependability. They will exact from every engine the utmost in power, speed, acceleration and economy because they are the better spark plugs.

Reviewing the Latest Eastern Markets

Milk Prices

The following are the August prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese, Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

July Prices Announced

The Dairymen's League announces the following pool prices for July for 3.5% milk.

Gross	\$2.42
Expenses	.06
Net Pool	2.36
Certificates of Indebtedness	.15
Net Cash Price to Farmers	2.21
July 1928, Net CASH Price, 3.5% milk	\$2.13
July 1928, Net POOL Price, 3.5% milk	\$2.28
July 1927, Net CASH Price, 3.5% milk	\$2.14
July 1927, Net POOL Price, 3.5% milk	\$2.24
July 1926, Net CASH Price, 3% milk	\$1.85
July 1926, Net POOL Price, 3% milk	\$1.95

The Sheffield Producers announce the cash price to producers for 3% milk in the 201-210 mile zone, as \$2.37½ per hundred, (\$2.57½ for 3.5% milk).

July 1928 price to producer,	3% milk, \$2.37½; 3.5%, \$2.57½
July 1927 price to producer,	3% milk, \$2.30½; 3.5%, \$2.50½
June 1926 price to producer,	3% milk, \$2.22; 3.5%, \$2.42

Butter Market Shows No Change

CREAMERY SALTED	Aug. 16, 1929	Aug. 9, 1929	Last Year
Higher than extra	44 -44½	44 -44½	48 -48½
Extra (92c)	43½ -43½	43½ -43½	47½ -47½
U-91 score	39 -43	39 -43	43½ -47
Lower G'ds.	38 -38½	38 -38½	41 -43

The butter market is substantially the same as it was last week. For a while it looked as though there would be some sag in the market for a good deal of stock had been carried over from the previous week. However, there was a fair amount of buying and prices remained unchanged. Buyers have been very critical and discriminating because of the irregular quality of much of the fresh butter arriving. The incoming supplies have been heavier than was anticipated creating some surprise in the trade, advices having created the impression that there would be a sharp falling off. Receipts are still running ahead of last year as are the cold storage holdings which ac-

counts for the widespread between the prices of this year and last year.

Fresh Cheese Holding Firm

STATE FLATS	Aug. 16, 1929	Aug. 9, 1929	Last Year
Fresh Fancy	23 -24½	22½-24½	25 -26
Fresh Av'ge			23 -24
Held Fancy	27½-29½	27½-29½	
Held Av'ge			

Last week we stated that the trend of the cheese market was to a firmer position. The market developed as we predicted. Price ranges have narrowed and the market holds firm on all styles of fresh cheese. Fresh New York State flats are being offered very sparingly and it would not be surprising to see the market continue in its present condition. There is no indication of any slack making its appearance. The demand is active and it is a comparatively easy matter to realize top quotations. Production in the East is running light which accounts for the lighter offerings.

Fancy Eggs Take Another Jump

NEARBY WHITE	Aug. 16, 1929	Aug. 9, 1929	Last Year
Selected Extras	48 -51	45-48	44-47
Average Extras	45 -47		41-43
Extra Firsts	37 -42	37-41	37-39
Firsts	34 -36	34-36	33-35
Undergrades	33 -	33-	32-
Pulleys	33 -39		30-34
Pewees	22 -28	22-28	25-27
NEARBY BROWNS			
Hennery	42 -48	40-46	40-43
Gathered	34½-41	34-39	31-39

Fancy eggs from nearby points are clearing readily and advancing steadily under lighter receipts. The undergrades on the other hand, show no improvement which bears out the statements that we have made repeatedly in these columns that the man who grades his eggs, ships a quality product and handles it so as to avoid damage by heat, realizes a handsome premium. The firmness does not only hold true of the Eastern section of the country for the West is showing extreme strength, in many cases being above par with New York City.

Buyers are very critical and are turning down many marks because of the effects of heat on interior quality. Many marks that have heretofore been top notch, have shown heavy shrinkage that has caused them to drop back to lower classifications. Those qualities that are a little off as well as mixed qualities are moving slowly because they come in direct competition with the moderately priced Pacific Coast standards which also show a surplus. To avoid this competition therefore, Eastern producers have got something fancy to enjoy the high dollar.

Live Poultry Market Slightly Unsettled

FOWLS	Aug. 16, 1929	Aug. 9, 1929	Last Year
Colored	28-30	28-30	28-31
Leghorn	20-25	25-27	25-28
CHICKENS			
Colored			
Leghorn			
BROILERS			
Colored	26-35	22-37	25-38
Leghorn	-28	25-29	28-35
CAPONS			
TURKEYS	25-35	25-35	
DUCKS, Nearby	22-23	20-26	20-24
GESE			

The live poultry market is a little off compared with the market of a week ago. Colored fowls are unchanged, are in light supply and full steady. From there on however, the story is slightly different. Leghorn fowls have slipped from 2c to 5c a pound and broilers are also considerably lower, with the exception of a limited number of Leghorn broilers which bring a 2c premium over the quotation given above, which brings them up to 30c. Some Reds have also shown improvement. The slump in the market was due primarily to the nine day Hebrew fast which more or less unsettled the market. At this writing, the outlook is a little better and if receipts will stay within reason we look for much improvement.

Hay Market Higher

The scarcity of fancy hay has compelled buyers to accept intermediate grades and prices have been forced up about \$1 per ton. Some new hay is arriving and if it is in good condition it

is bringing about \$2 less than old hay of a similar grade. The majority of the arrivals are of No. 2 grade on which the market is firm. Lower grades are fairly steady.

Straw receipts have been more liberal of late and prices have trended downward. Rye straw generally brings from \$18 to \$19, while oat straw generally sells at \$15.

Potatoes Continue Firm

The potato market continues to bound along merrily with Long Islands bringing from \$4.50 to \$5.50 for No. 1 quality. A year ago Long Islands in the same size package were bringing from \$1.75 to \$2.00. The fly in the ointment this year is that the yield is so poor that a lot of the joy is taken out of life.

Fruits and Vegetables

Hudson Valley basket apples of most varieties and Clapps Favorite pears were generally lower in prices during the latter part of the week. Supplies were more plentiful and the demand was less active. Scattering small shipments of crab apples, peaches, early variety blue grapes, and plums, have commenced to arrive from the lower River district.

APPLES—Western New York Sections: barrels, Duchess U. S. Grade No. 1 2½ inch mostly \$5.00, commercial pack 2½ inch \$3.50. Hudson Valley: per bushel basket, Alexander U. S. Grade No. 1 2½ inch \$2.00-3.00, 2½ inch \$1.75-2.25; Duchess U. S. No. 1 2½ inch and upward \$1.50-2.25; Gravenstein U. S. No. 1 2½ inch \$1.75-2.50; Williams Red U. S. No. 1 2½ inch and upward \$2.50-3.50; Wolf River U. S. No. 1 2½ inch and upward \$2.00-3.00; Wealthy U. S. No. 1 2½ inch \$1.50-2.50. Various other varieties, U. S. No. 1 pack 2½-2½ inch and upward \$1.00-2.00; ungraded, various sizes 50c-\$1.25, few \$1.50.

CRAB APPLES—Hudson Valley: various early varieties, per bushel basket \$1.50-2.50; per 12 quart basket 50c-\$1.25.

GRAPES—Hudson Valley: per gift crate (eight baskets) Champion \$1.00-1.25; Moore's Early \$1.25-1.50; climax baskets, 12 quarts, Champion mostly 75c.

PEACHES—Hudson Valley: various varieties, per 12 and 16 quart basket 25-75c. New Jersey, per carrier, six four quart baskets, Elbertas \$1.00-2.25; Georgia Belle 75c-\$1.25; Hiley Belle 75c-\$1.25; Champion 75c-\$1.50.

PEARS—Hudson Valley: Bartlett, per bushel basket \$1.50-2.25; Clapps Favorite, per bushel basket, fancy pack \$2.25-2.50, few \$2.75; fair quality, medium size \$1.75-2.00; ordinary and small \$1.00-1.50; per 12 quart climax basket 50-75c; per bushel box \$2.25-2.75; per barrel No. 1's \$6.00-7.50; No. 2's \$3.00-5.00.

PLUMS—Hudson Valley: Early blue varieties, per 12 quart climax basket, \$1.00-1.25; four-quart basket 40-50c.

String beans from all sections of the state varied greatly in quality and tenderness and in consequence prices ranged widely. The tone of the market at the close was dull and weaker, especially on wax beans. Cut beets and carrots were without important change. Cabbage was lower in prices toward the end of the week as the demand slowed up.

CAULIFLOWER from the Catskill Mountain area was in very generous supply this week and values were decidedly lower than one week ago. Little activity prevailed for celery throughout the week. Cucumbers tended lower as supplies increased. Celery, cabbage and escarole have begun to arrive in limited volume.

Higher prices were obtained on lettuce and romaine in a firmer market during the last of the week. The demand was more active. Green peas steadily declined throughout the week. Arrivals were more than sufficient to meet trade requirements.

CAULIFLOWER—Catskill Mountain Sections: per crate, best mostly \$2.50-3.25, few extra fancy \$3.50, fair quality \$2.00-2.25; No. 2's \$1.25-1.75.

CARROTS—Western New York Sections, Orange and Oswego Counties: per bushel hamper, cut stock, store sales, unwashed \$1.25-1.50, few extra fancy large \$1.60-1.65; washed \$1.50-1.75.

CELERY—Orange County: per bunch of 12 stalks 15-17c; depending upon size and quality. Stock in the rough, wide range pack, size, quality and condition, per two-thirds crate \$1.50-2.50; half crates \$1.00-1.75; quarter crate 75c-\$1.25; High Ball crates \$1.00-1.50. Oswego County, in the rough, per two thirds crate, best \$2.00-2.50, few \$2.75, poorer \$1.25-1.50. Western New York: in the rough, two thirds crate, best \$2.00-2.50, poorer \$1.50-1.75.

CUCUMBERS—Western New York and Oswego County: per bushel basket, wide range quality and pack, No. 1's \$2.00-3.50, mostly \$2.50-2.75; No. 2's \$1.50-2.00;

dills \$2.00-3.50, mostly \$2.50-3.00; pickles \$1.50-3.25. Albany County, per bushel basket, cucumbers \$2.50-3.00; dills \$2.50-3.25; per barrel \$12.50-14.00.

LETTUCE—Big Boston, per crate of 24 heads, all State sections, best, \$1.25-1.50; one lot extra fancy \$1.62-1.75, fair quality 75c-\$1.00, poor 50-60c. Iceberg type lettuce, per crate 75c-\$1.25. Western Iceberg crate of 42-60 heads, California 50c-\$4.50; Colorado 50c-\$2.25; Washington \$4.00-4.50.

ONIONS—Orange County: jobbing store sales, per 50 pound bag, yellow \$1.00-1.25; white, boilers \$1.25-1.75; sacks of 100 pounds yellows \$2.00-2.50; red \$2.00-2.50, depending upon size and quality.

SQUASH—Oswego County: per bushel basket, yellow crooked neck 40-75c.

TOMATOES—Hudson Valley: various varieties, per carrier of six four-quart baskets mostly \$2.25-3.00, few extra fancy \$3.25-3.50; fair quality \$1.50-2.00; per 12 quart climax basket 75c-\$1.25. Western New York, per 12-quart climax basket, green 65-75c. Maryland, per carrier of six four quart baskets, fancy pack \$1.50-2.50; choice pack \$1.00-1.50.

Feeds and Grains

FUTURES (At Chicago)	Aug. 16, 1929	Aug. 9, 1929	Last Year
Wheat (Sept.)	1.39½	1.34½	1.12½

TRUCK *and* BUS TIRES

FIRESTONE REACHES AROUND THE WORLD TO SERVE YOU BETTER

All branches on the same tree; all growing out of the Chrysler root principle of standardized quality

*Price
Follows Quality
in
Chrysler Motors
Products*

IN any Chrysler-built car, quality is the hub about which everything else revolves. Even the slightest compromise with quality is unthinkable. The products of Chrysler Motors cover a wide range of prices, but each product represents the utmost in value in its own class.

Chrysler forces long ago sensed the ever-increasing demand for higher quality, better style and greater luxury, and prepared to be ever ready to comply with it. Walter P. Chrysler and his associates have always concentrated on ways and means of giving the public a greater measure of all the things that make for satisfactory motoring.

The reason that Chrysler Motors values are high is because a great organization of the best engineering talent, exceptional efficiency in manufacturing and constant study of the public need enables Chrysler Motors to build all its cars better and more economically.

Thus Chrysler Standardized Quality is held uncompromisingly at the highest known level, with an even higher one constantly sought, while the manufacturing departments strive to bring about improvements in operations that will enhance the buying power of the consumer's dollar.

All Chrysler Motors products, from the lowest-priced to the highest-priced, are as unique in quality and value as in performance, beauty and dependability.

First to sense its approach, first to prepare for it, Chrysler Motors is best qualified to meet the buying impulse of today—a demand for quality first and last, for exceptional value in every price class.

PLYMOUTH

AMERICA'S LOWEST-PRICED
FULL-SIZE CAR

THE FULL-SIZE COUPE (Special Equipment Extra)

*Pride Appeal
as well as Price Appeal*

PLYMOUTH throws a bright white spotlight on the fact that a motor car of low price can also be a motor car of praiseworthy quality and *full-size* dimensions.

It is true that the remarkably low price attracts thousands of people to Plymouth. However, it is the higher quality and superior merits of Plymouth that account for Plymouth's sweeping success and popularity. At last, America has a low-priced motor car which appeals to pride just as much as to purse.

Plymouth is the only *full-size* motor car at anywhere near its price. That means quality-car roominess and comfort.

Plymouth is the only low-priced car with the smart and graceful characteristics of

Chrysler designing. That means quality-car style and beauty of line and fitments.

Plymouth is the only low-priced motor car embodying the advanced discoveries of Chrysler engineering. That means quality-car performance at all speeds.

Plymouth is the only low-priced car with Chrysler internal-expanding 4-wheel hydraulic brakes—weatherproof and self-equalizing. That means quality-car safety, with ease and certainty of control in traffic.

The only way in which you can really appreciate the superior qualities of Plymouth is to sit behind the wheel and try the car in your own way. The more exacting you are the more convincing the proof.

Farm News from New York

Fruit and Vegetable Growers Form Fifty Million Dollar Marketing Organization

THE United Growers of America, a nation-wide fruit and vegetable growers co-operative marketing association, has been formed by a group of nationally known men identified with agriculture, it was announced here this week. The new co-operative is capitalized at fifty million dollars and will work in harmony with policies laid down by the Federal Farm Board. Its charter contains a verbatim reprint of Section 1 of the Agricultural Marketing Act. Since it filed its charter a few days ago, hundreds of letters and telegrams have come into the head office, 140 Cedar Street, New York City, asking for information concerning it.

The men who have assisted in bringing about the United Growers have had only one objective in mind, and that is to assist the growers of fruits and vegetables in organizing a better marketing system of their own. They believe the greatest opportunity for aiding this branch of agriculture lies in the field of marketing. There are several hundred co-operatives, more or less local in character, built around one commodity—sometimes two or more commodities—all more or less competing with each other in central markets of the country. Only two or three of the larger ones retain possession of that which they produce beyond the local community. In other words, they assemble their crops and then turn them over to various agencies, mostly non-co-operative, and speculators to sell for them.

A Wasteful System

We thus have our present system, which is extravagant and wasteful. Most farmers realize this, but they are helpless. Many of them need production credits and harvesting credits with which to buy fertilizers; prepare their ground; buy their seed; do their spraying; picking; packing, etc. Most of this credit to-day comes from a multitude of sources, for which the farmer pays a high price. For example, thousands of farmers get their fertilizers through these channels at retail prices and pay substantial interest for money tied up in fertilizer advances, which fertilizers have been bought by dealers in large quantities at a wholesale price but retailed to the farmer. Only farmers, however, who sign a contract to market what they produce through the institution that furnishes them their fertilizers or their credits, can get these credits. Until someone else is in a position to provide such loans to farmers, it is doubtful, very doubtful indeed, if they will be able to join a co-operative marketing organization. The United Growers of America will be prepared to furnish loans to those who are worthy of such assistance, as well as a marketing system which will retain possession of their crops until

they are delivered closer to the point of consumption.

Type of Loans Needed By Producers

1. *Production Credits.* This applies to farmers who are doing a decent job at farming, who are growing crops reasonably economically. Many of them are tenant farmers, who do not own their land and are unable to get credit from those who do own their land. This is the usual case in the production of fruits and vegetables in this country.

2. *Marketing Credits.* This applies to credit available to farmers when the crop is ready to harvest and dispose of.

3. *Facilities Credits.* Money that will enable a co-operative which belongs to this national program, to get the necessary 20% required in building cold storage plants, packing plants, warehouses, etc. In other words, under the Farm Marketing Act a co-operative may go to the Board for a loan to build a pre-cooling plant, packing plant or warehouse. The Board can loan it 80% of the cost and the farmers will have to dig up 20%, but the Board is not authorized to loan money to a local co-operative to build packing plants, etc., unless its operations fit more or less into a national marketing scheme of a logically large scale.

The United Growers furnishes the national overhead marketing agency for the locals. These locals own stock in the national; they are represented in it by directors; it is a part of their marketing organization; it represents them in the big markets and the little markets of the nation; it is their eyes and their sales agency. Operating solely for the purpose of getting a fair price and a fair percentage of the price, the consumer pays for the farmer. It is non-profit marketing; it only sets aside a reserve sufficient to take care of obligations and requirements consistent with sound business practice.

It is the only practical way for the little cooperative built around a commodity that must be marketed in two or three months and nothing further to do for another year, to get fair and just treatment in our large consuming centers.

Farmers Can Control Marketing

It is either this way or to continue the present method, that is, to let the commission men, jobbers and speculators have the sales agencies, furnish our credits and the grower continue paying the large costs to maintain the present system. Tremendous savings are possible in the merchandising of our crops. A large part of the consumer's dollar can be gotten back to the farmer, but not through our present system which is getting more expensive each year. Our industrial centers grow larger. These improvements can only be brought about when farmers, like manufacturers and producers in other lines, join together in developing their own marketing system, enabling them to keep possession of that which they produce until it gets close to the consumer, and selling their own stuff instead of having jobbers, commission houses, etc., sell it for them, and it is this service that the United Growers of America was organized to render.—ARTHUR R. RULE, *General Manager Federated Fruit and Vegetable Growers.*

New York County Notes

Cattaraugus County—The second week of August finds even the most tardy farmer through haying and the wheat in shocks and oat harvest on in a few days. The time off is being utilized by many farm owners in painting and repairing farm buildings, building new silos and erecting new fences as an aid to spring work. The tenant farmer either works on highway or for the other farmers or visits friends. Town picnics and family reunions are in full swing and will claim

the attention of farm folk until the fairs start the last of the month. The Cuba, Erie and Chautauqua County Fairs are all within driving distance not to mention Cattaraugus County in Little Valley, August 27-31. A new fence has been built enclosing grounds.—M.M.S.

Cayuga County—Haying is nearly over and the wheat harvested and mostly under cover. Oats are now ripening. We have had some very nice weather. The dry spell was followed by heavy rains and now things are beginning to grow. We will have but little fruit this year, very few peaches and pears. Cows are high and scarce and milk is going up. Feed prices have advanced, on some feeds up to \$4.00 per ton. Eggs are 40c and 42c, locally, and hens are laying well. Poultrymen are getting better profits than last year. I am expecting to see a rather heavy acreage of wheat sown this fall. Corn is looking good and growing rapidly and will probably mature.—A.D.B.

Clinton County—The Annual Farmers' Picnic will be held at Mooers this year on August 28. Mr. H. H. Rathbun of the Dairymen's League will be the speaker. Hay was a good crop and has been mostly harvested in a better condition than usual. Some rust on the potatoes. Corn though planted late has made good use of the hot weather. N. W. Hoag is building a large barn on his farm at Point au Roche.—R.J.M.

Columbia County—Another week of hot, dry weather. Many vegetable gardens have been ruined completely. The dog catcher has commenced his tour of the county. Band concerts are being held in Court House Park, Hudson, and are well attended. Annual picnic August 11, of V. F. W. Auxiliary at Prospect Lake. Work is progressing favorably at their new building on 6th St., Hudson. Farmers have finished haying and now are busy with oats. A chicken supper will be held in Glanco Mills, August 21 under the auspices of the church in that place. At the school meeting in Philmont, \$12,000 was voted to school use. Bartlett pears \$2.75, Clapps \$2.50, wild huckleberries 25c a quart, native lettuce 5c a head, new potatoes 68c a peck, eggs 39c and butter 44c in trade at county stores.—Mrs. C.V.H.

Government Reports Indicate Light Potato and Fruit Crops

AT the present time the production of potatoes in New York promises to be less than that produced in 1928 according to a state-federal report, just issued from the New York State Department of Agriculture and Markets. The average yield per acre of potatoes in the two principal potato growing counties of Nassau and Suffolk will be low. Upstate potatoes are still growing but many of the vines do not appear to have made their normal growth on account of the dry hot weather although they appear fairly healthy to date. With favorable weather their growth may still improve considerably. With warm humid weather late blight

still has a chance to take a considerable toll of the crop.

Production for the state is now estimated at about 28,500,000 bu. compared with about 32,400,000 bushels last year and the average for the past five years of 32,500,000 bushels. Production promises to be less in practically all of the principal potato growing states of the north except Maine where growing conditions have been more favorable.

The total United States potato crop is now forecast at about 373,000,000 bushels compared with 464,000,000 bushels last year and the five year average of about 383,000,000 bushels.

Bean Crop Estimated Above Last Year's Crop

The condition of beans is spotted in New York State but in general they look better than a year ago on August 1. Present prospects are for a production of about 1,215,000 bushels compared with 1,160,000 bushels harvested last year and 1,464,000 bushels, the average for the past five years. Michigan's forecast is for a production of about 6,615,000 bushels compared with about 5,918,000 bushels last year and 6,631,000 bushels the average of the five previous years. Idaho promises 1,700,000 compared with 1,476,000 last year. California promises about 4,478,000 compared with 4,425,000 last year.

Total production for the United States is now forecast at 17,626,000 bushels compared with 16,621,000 bushels harvested last year.

Apple Crop Light

From the present condition the apple crop is now forecast at only 18,860,000 bushels compared with the light production of 21,900,000 bushels last year and the average for the five previous years of 26,695,000 bushels. Of the early varieties, *Wealthy* has the best

prospects and of the late, *Baldwin* appears best at the present time.

Production is lighter in practically all of the important apple growing states. For the whole United States the forecast is for about 149,000,000 bushels compared with about 186,000,000 last year and 183,000,000 the average for the previous five years.

Pear production promises to be light in New York, only about 1,069,000 bushels compared with 1,800,000 bushels during the previous five years. The three states of Washington, Oregon and California, which have been producing better than 50 percent of the country's pears during the past few years, indicate nearly 30 percent less than last year's production. For the entire country a crop of about 20,000,000 bushels is promised compared with about 24,000,000 bushels last year.

Peach production is also off this year. Present indications point to a state crop of 1,700,000 bushels compared with 2,400,000 last year and 1,850,000 the average for the past five years. In Georgia there is only about 25 percent of last year's large crop and in California about 50 percent. For the whole United States, the forecast is for only about 45,000,000 bushels compared with 68,000,000 last year.

The U. S. Grape Crop

Grapes promise a production of about 76,000 tons in New York this year compared with about 85,470 tons last year and the previous five year average of 70,412 tons. Production also promises to be about 25 percent less than last year in Pennsylvania, 40 percent less in Ohio, practically the same as last year's production in Michigan and about 25 percent less in California. The United States production of grapes is now forecast at about 2,060,778 tons compared with 2,671,076 tons harvested last year.

Juniors Exhibit at St. Lawrence Farmers' Picnic

THE third annual Farmers' Picnic in St. Lawrence County arranged by the Grange, Farm and Home Bureau, the Dairymen's League, and the Canton Advertising Club was held at the Fair Ground at Canton on Thursday, August 8. The exhibit of calves by members of the 4-H Clubs was a fine sight. All of the four breeds, Ayrshire, Holstein, Guernsey and Jersey were well represented. The principal prize winners were Herbert Putman, Gouverneur; James Clark, Potsdam; Lyle Richardson, West Stockholm; Loretta Clark, Potsdam; Worth Coates, Gouverneur; Junior Clark, Potsdam; George Clark, Potsdam; Claude Moulton, Winthrop; Myron Foster, West Stockholm; Grace Moulton, Winthrop; Charles Chambers, Brasher Falls; George Moulton, Madrid; Richard Smithers, Ogdensburg; Everett Parr, Winthrop; Frederick Parr, Winthrop; Edwin Smithers, Ogdensburg; William Lamb, West Stockholm; Inda Wilson, Heuvelton; Erma Wilson, Heuvelton; Barton Armstrong, Ogdensburg; Hazel Moulton, Winthrop; Elizabeth Baum, Potsdam; and Reginald Drake of Potsdam. The special prize of \$5 for the best developed and fitted female calf, offered by Bassett & Lewis was

won by William Lamb. The special prize of \$5 offered by the St. Lawrence County Holstein Club was won by Charles Chambers. In the Girls Showmanship Contest Loretta Clark was first, Elizabeth Baum, second and Hazel Moulton, third. In the Boys Showmanship contest Reginald Drake was first, Herbert Putnam second and George Clark, third. R. M. Thompson of Heuvelton was judge of the cattle.

There was a fine exhibit by members of the 4-H Homemaking Clubs. More than one hundred cans of fruit and vegetables were shown, also a fine exhibit of dresses, nightgowns and pajamas made by the girls. Some of the winners in these classes were Loretta Clark, Potsdam; Dorothy Ballou, Stockholm; Barbara Pelsue, West Stockholm; Sara Austin, West Stockholm; Muriel Forbes, Massena; Dorothy Pruner, Madrid; Vivian Senter, Potsdam; Geraldine Moulton, Winthrop; Hilda Hunt, Potsdam; Florence Moulton, Winthrop; Grace Moulton, Winthrop and Dorothy and Ruth Hunter, Madrid. The Demonstrations put on by the Clubs were splendidly done. Stockholm Club won first place with table setting and preparing breakfast. Rock Island Club was second with a sandwich demonstration and Half Way House Club, third with supper preparation.—J. A. FISHER.

Fruit Cocktails

Now is the Season to Prepare to Have These Delicious and Healthful Foods All Winter

JUST saying "Cocktails," makes one feel gay and sophisticated, still I wonder how many farm women use them in their daily menu. My family is very fond of these appetizers and I use many combinations of fruits and flavors.

A dull dinner can be made to appear

CROSS STITCH SAMPLER B5272 comes stamped in three colors on finest quality oyster linen. Floss included for working. PRICE 75c. Even the school girls enjoy making these beautiful old-fashioned samplers. When framed, they are most attractive for a room containing old furniture. Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

quite festive by the addition of a dainty fruit cup, and while it adds color and beauty to the meal, I also have the satisfaction of knowing my family's health is benefited by this wholesome course.

Sherbet glasses or cups are easily obtained at the five and ten but I am particularly fond of a set of footed glass sauce dishes which belonged to my grandmother; such dishes were quite common years ago but are valued nowadays.

I have no set rules for my cocktails, only for economy's sake. I combine fresh and canned fruits; orange, grape fruit and bananas are used for a flavor with the fresh home grown or canned fruit. A small ball cutter is used for firm apples, these balls sprinkled with lemon juice, and combined with canned peaches, a few cherries and perhaps a bit of orange; often I pour grape juice over the fruit, this gives a delightful flavor and makes a colorful dish. Dur-

ing the canning season I prepare some fruit in half pint jars especially for cocktails. Small or imperfect peaches yield a few slices, pears cooked with orange peel and broken bits of pineapple or juice left from canning all come in very conveniently for winter use.

Watermelon and cantaloupe cut into balls sprinkled with lemon juice and a dash of chopped mint make a party cocktail.

During the winter months, one craves the citrus fruits, but prices are high, so I use my home canned peaches, pears, sweet cherries, etc. and add one grapefruit and an orange which makes

Extermination.

1. Destroy centipedes whenever seen.
2. Apply fresh pyrethrum powder.

Carpet Beetles (Buffalo Bugs).

Feed upon carpets and woollens and silks. Are most destructive because they eat so many types of things.

Prevention.

1. Replace carpets by rugs.
2. Take up carpets at least twice a year, and thoroughly clean carpets and floors.

Extermination.

1. Thorough house cleaning: Thoroughly clean carpet. Spray

—(a) sweep carpets and take up often; (b) wash floors with strong soapsuds; (c) fill up cracks of floors; (d) sprinkle carpets with benzine or gasoline; naphthaline, or alum (powdered or in solution).

2. Repellents— (a) Oil of Pennyroyal; (b) boughs and chips of pine; (c) naphthaline crystals; (d) pyrethrum.

The oil of pennyroyal can be applied to the human skin; or can be used in the household by rubbing around window or on floor.

Rats and Mice, Squirrels, Chipmunks.

All are very destructive of food, clothing and leather and are very dirty.

Prevention.

1. Close all holes or openings by which they enter. Tin makes a good cover.
2. Keep all food covered.
3. Leave no crumbs about.

Extermination.

1. Traps set near possible entrance. Scald traps before setting to remove suspicious odors.
2. Poisons— various preparations on the market. Cannot be used with pet animals about.
3. Cats as catchers.
4. Weasels—professional vermin exterminator brings his own weasels.

—L. Ray Balderston's Housewifery.

LUNCHEON SET NO. C2571 comes stamped for embroidery on maize-colored tub-fast Venetian. The set includes one 36-inch lunch cloth and four 14 inch napkins. Strawberry applique patches of fast color Peter Pan are included. PRICE \$1.00. Order from Embroidery Department, American Agriculturist, 461 Fourth Avenue, New York City.

an appetizing cocktail for my family of six.

Sometimes I reverse the process and after a hearty meal serve such a fruit mixture as a dessert by adding a few marshmallows or a dip of whipped cream on each glass, topping it with a preserved cherry or a sprinkling of shredded coconut.—MRS. E. D. DER., New York.

To Get Rid of Pests

Bed Bugs.

Possible carriers of disease. Found in dusty, undisturbed places first; easily carried in clothing.

Prevention.

1. Inspection of beds and bedding, especially seams and tuftings of mattresses.
2. Careful inspection of all baggage and clothing coming into the house.

Extermination.

1. Hot water.
2. Benzine or kerosene injected into all crevices of beds and walls.
3. Corrosive sublimate.
4. Oil of turpentine.
5. Fumigants: sulphur—to be burned—most efficient remedy, but to be handled with great care.

Centipedes.

Abundant in bathrooms, moist closets, cellars, conservatories, and around heating pipes and registers.

Prevention.

1. Constant inspection of moist places.
2. Keep places dry and aired.

with benzine. Wash floors with hot water. Clean out cracks—pour kerosene or benzine into cracks under baseboards. (Benzine very inflammable). Fill cracks with plaster-of-Paris. Lay tarred paper under carpets. Every little while take up edges of carpet and look for insects.

2. Steam—Place damp cloth over carpet; iron with hot iron. Steam will pass through carpet and will kill insects directly under the ironed part.

3. Poison.—Corrosive sublimate and alcohol—60 gr. corrosive sublimate dissolved in 1 pint of alcohol. Apply to edges and undersides of carpet; will destroy larvae. (Great care must be used because corrosive sublimate is a violent poison).

Fleas.

Parasites and carriers of disease. Two species in dwelling houses: human, and cat or dog flea.

Prevention.

1. Destroy adult flea; the eggs are like small black powder, called nits.
2. Keep cats and dogs clean and free from fleas. Bathe frequently in solution of creolin. For dogs—4 tablespoons creoline to 1 quart water. For cats—2 tablespoons creoline to 1 quart water.
3. Animals' sleeping rug or pillow should be often beaten and hung in the sun.

Extermination.

1. Care of carpet, rugs or floors.

Smartly Draped

2876

DRESS PATTERN NO. 2876 is very fortunately designed to flatter the full figure. The surplice closing and jabot drape of skirt make a continuous front line which serves to make the figure look smaller. The snug hip yoke gives the season's smart touch. Pattern cuts in sizes 16, 18 years, 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 3 yards of 40-inch material with $\frac{3}{8}$ yard of 12-inch contrast and $1\frac{1}{2}$ yards of $3\frac{3}{4}$ -inch lace. PRICE 13c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c. for one of the fall and winter fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

In every circle there is the smartest dressed woman. She bears and deserves that title because she makes her selection from a correct offering and has in mind the while that certain lines most become her type.

You should not envy her but, rather, should follow her example. See the most attractive and charming styles and make your selection with care.

The first step is to obtain the Fall Fashion Magazine showing all that is new and of good line. Just send 12 cents in stamps or coin to Fashion Department, American Agriculturist, 461 Fourth Ave., New York City.

Aunt Janet's Counsel Corner

Here is an Opportunity to Spread a Little Sunshine

SOMETHING which we have wanted to do for a long time might just as well be done now as ever. From letters which have come to us we know that practically every community has its shut-ins, not only the old and helpless, but young handicapped people as well.

To one of these unlucky people, contacts with the outside world are few and far between. A visit is always welcome but this is more or less limited to the neighbors. The next best thing is a letter or card. If one felt like doing more, then magazines or books or flower seeds or any bright cheerful thing might be sent to the sufferer. And everybody can do that much. We could call this a "Help One Another" list and each week or so publish the names and addresses of those to whom such cards or letters would be an event. If each reader of the Corner sends

devil's food that I have a different one for every day of the month, only I don't make it every day. Every one I have tried has been good. I guess other little cooks like it as well as I do. When the weather is cooler I will use candy recipes.

Thank you for all your nice letters and recipes.—BETTY.

* * *

DEAR BETTY—I have two dear little granddaughters, 6 and 3 years old who are very anxious to "help" about most everything that goes on in the farm home, so I am enclosing 10c for one of your scrapbooks so that they can learn to be real cooks like you. Thank you very much.—Your friend, MRS. L. M., N. Y.

* * *

DEAR BETTY—I wish you the best of cooking luck. I am eighteen and have kept house alone for almost two years but I think you know more about cooking than I do. So I am enclosing ten cents for your cooking scrapbook.

I was just graduated from high school last June but I never studied cooking or sewing there. I sincerely hope that you will start sewing on the same plan as the cooking lessons. Although I know how to sew and cook, I feel that I could do better if I started at the beginning and put my knowledge in order. I'm sure that other young people would find advantage in at least reviewing your lessons and they might find something new. I'm sure I have found out many things I never dreamed could be fit to eat.

Well, I must say goodbye, but I will think of you every time I break an egg or wash dishes.—Your sincere friend, M. E. B., N. Y.

* * *

DEAR BETTY:

I am sending for one of your scrapbooks with recipes up to date printed in. I have five girls, the oldest thir-

teen and the youngest two and a half years. I am interested in the recipes as they all want to cook. If they have a book of their own they may do better.

As I have had to work outdoors they have tried a good many things which has meant lost recipes and torn

Bertha Collar

2905

PATTERN NO. 2905 has the popular bertha collar so well suited to the slender figure. The illustration reveals the bertha of ecru Alencon lace attached to an afternoon frock of printed chiffon in rich wine-colored coloring. Sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 3/8 yards of 39-inch material with 7/8 yard of 35-inch contrasting. PRICE 13c.

ones too. We have a steam pressure cooker now which the oldest girl likes to practice on. The third girl was eight years old in April.

Having so many children, nine in all, it is hard to keep track of the recipes but will try to keep the pages to paste in after we get our new book.

Yours truly

Mrs. G. I. W.

* * *

DEAR BETTY:

I am visiting at my grandmother's and saw in the American Agriculturist which she takes, your name. As I am eleven and wish to learn to cook and have not a cook book, I would like one of yours. Will you please send all the lessons so far in the book for me?

Enclosed I am sending ten cents in stamps for the book.

I thought you might like this recipe. It is called French toast. I make it and like it very much. You beat one egg and add about one tea-cup of milk. Put a little butter in a spider and let it melt. Dip white bread into the egg and milk and then put the bread into the spider and fry until it is light brown.

Yours truly

D. A., N. Y.

* * *

DEAR BETTY:

I made some muffins today for dinner. They were good too. I have made lots of things. I told mother I wished the recipes would come every week instead of every four weeks. All the things I made were good too. Daddy said I was getting to be quite a cook.

Paint a Parchment Shade!

Here is an exceedingly smart parchment shade that you can easily paint at small cost. The modernistic pattern comes stamped on parchment paper and all you have to do is paint in the colors following the chart as every part is numbered and there is no shading.

Each order consists of a 10-inch wire frame, two strips of parchment 10 3/4 by 34 inches, perforated, and scored for pleating, and with design stamped, a silk cord and tassels. It can be equipped for either a table or bridge lamp. Order number 537, \$1.65 postpaid.

We can also furnish special lacquer assortment of three beautiful transparent colors, black, and brush and alcohol at \$1.35 postpaid. This is order number 538 and is enough for several shades.

Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

in the name or names and complete addresses of people in her neighborhood or county who ought to receive such attention, the list could be arranged according to territory. It may be the name of a person who is permanently shut-in or one who is slowly convalescing from some illness.

One case we know was a little boy with tubercular legs; you will think of many other cases right in your own county. So send them in: everybody likes to spread sunshine—that is, if she is a normal human being. This is a chance to do our good turn today, as the Boy Scouts are taught to do every day. Tell enough of their conditions or age that readers will know something of the circumstances under which they live. Send the names and addresses to Aunt Janet, c/o American Agriculturist, 461 Fourth Ave., New York City.

—AUNT JANET.

A Letter from Betty

DEAR LITTLE COOKS:

So many of you have sent me recipes that I just can't use them all on the recipe page. It would take all the pages that mother reads and those that tell daddy about what to feed the cows and horses and all that if I used them all and I want to tell you I am sorry I can't have them all printed because they all sound so good. You see (mother says) editors have to suit everybody so of course little cooks ought to be happy with a whole page of their own once a month.

So many, many have sent recipes for

Smart for Young Girls

2919

COAT PATTERN NO. 2919 makes up handsomely in suede-finished woolen or in tweed for the young girl's general wear. A flat fur or contrasting material could be used for collar, cuffs and front trim. A suede belt in matching color is attractive. Designed in sizes 6, 8, 10, 12 and 14 years. Size 8 requires 1 3/4 yards of 54-inch material with 7/8 yard of 35-inch contrasting and 1 1/2 yards of 39-inch lining. PRICE 13c.

How wise to

First Save Yourself!

What are a few pennies on washday, compared to your own precious strength? With Fels-Naptha you get . . . not more bars, but more help . . . the extra help of two active cleaners combined in one golden bar. Naptha, the dirt-loosener, and good golden soap, the dirt-remover. Health Pamphlets for Mothers and Young Children.

Talks on sex to older children.

In doing applique work it will be found much easier to hold the designs in place if the designs to be appliqued are first dipped in a solution of cold starch before being placed in their proper positions on the goods. Then iron the designs down. This temporarily insures their position while one is working the decorative stitch around the edges. Little daughter who is learning the button hole stitch will enjoy appliqueing in this manner.—P. M. W., New York.

The Plains of Abraham—By James Oliver Curwood

They did not make him leave the open trail or travel less swiftly, but his senses became keener, and unconsciously he began to prepare himself for the physical act of vengeance.

To reach Tonteur was the first obligation in the performance of this act. Tonteur still had a few men who had not gone with Dieskau, and as Jeems recalled the firing of guns, a picture painted itself before his eyes. The murderers of his father and mother had swung eastward from Forbidden Valley, and the seigneur, warned by Hepsibah's fire, had met them with loaded muskets. He had faith in Tonteur and did not question what had happened in the bottom lands. Before this no doubt had crossed his mind as to Hepsibah's fate. The English hatchets had caught him, somewhere, or he would have come during the long night when he and Odd had watched alone with death. But now a forlorn and scarcely living hope began to rise in his breast as he came to Tonteur's Hill—an unreasoning thought that something might have driven his Uncle Hepsibah to the Richelieu, a hope that, after lighting his signal fire, he had hurried to the Manor with the expectation of finding his people there. His father must have seen Hepsibah's warning across Forbidden Valley, and had waited, disbelieving, while death traveled with the shades of night through the lowlands.

He might see Hepsibah, in a moment, coming over the hill. . . .

Hepsibah, and the baron, and men with guns. . . .

Even Odd seemed to be expecting this as they sped through the last oak open and climbed the chestnut ridge. There were partridges here from dawn until half the morning was gone, and a covey rose before them with a roar of wings. Maples grew on the side toward the Richelieu, and the leaves were knee-deep. Beyond these were the thick edging of crimson sumac, a path breaking through it, and the knob of the hill where they had always paused to gaze over the wonderland which had been given by the King of France to the stalwart vassal Tonteur.

Jeems emerged at this point, and the spark which had grown in his breast was engulfed by sudden blackness.

There was no longer a Tonteur Manor.

A thin, earth-embracing fog covered the bottom lands. It was a veil drawn lightly to cover the ugliness of a thing that had happened, something that was not entirely unbeautiful, a cobwebby, multi-coloured curtain of pungent smoke drifting in the sunlight, a fabric strangely and lazily woven by whitish spirals that rose softly from wherever a building had stood in the Tonteur seigneurie.

Now there were no buildings but one. The great manor house was gone. The loopholed church was gone. The farmers' cottages beyond the meadows and fields were gone. All that remained was the stone gristmill, with the big wheel turning slowly at the top of it and making a whining sound that came to him faintly through the distance. That was the only break in the stillness.

Jeems, looking down, saw in the drifting veil of smoke a shroud that covered death. For the first time he forgot his father and mother. He thought of someone he had known and loved a long time ago. Toinette.

CHAPTER X

HIDDEN against the scarlet-topped sumac Jeems stood for many minutes gazing upon the scene of ruin in the valley, too heavily scarred by his own tragedy to be conscious of great shock again. The thing was an

enormity which stunned him, but it did not lock his reason and his power to act as the other had. Here his hopes were set at an end, and his mind, seizing upon facts as the death shroud in the valley told them to him, cut away with the keenness of a knife the mental umbra which had obscured his vision. The last of his world which might have remained was destroyed, and with it, Toinette.

Below the thin veil of smoke through which he surveyed the bottom land there was no sign of life, and no movement except the turning of the wheel

insistence over the solitude, as if calling to someone. It became less a thing of iron and wood that was crying in its hunger for oil, and more a voice which demanded his attention. It seemed to him that suddenly he caught what it was saying: "*the little English beast—the little English beast*"—repeating those words until they became a rhythm without a break in their monotony except when a capful of wind set the wheel going faster. It was as if a thought in his brain had been stolen from him. And what it expressed was true. He was the English beast,

a long figure lay on the ground. Jeems went to it slowly. The smoke-scented air suffocated him as if it were a fragile weave which lacked the gift of life. This oppression was heaviest when he saw that the sprawled-out form was Tonteur. Unlike the others, the baron was fully dressed. He undoubtedly had been armed when he rushed forth from the house, but nothing was left in his hands but the clods of earth which he had seized in a final agony. A cry broke from Jeems. He had loved Tonteur. The seigneur had been the one connecting link between his older years and the dreams of his childhood, and it was because of him that he had never quite seemed to lose Toinette. Until now he had not realized how deeply Tonteur had found a place in his affections or how necessary he had been. He crossed his hands upon his breast and loosened the earth from his fingers. He could feel Toinette at his side, and for a brief interval the sickness in his head and body overcame him so that he could not see Tonteur at all. But he could hear Toinette sobbing.

Against this clouding of his senses he felt himself struggling as if swimming in an empty space. Then he could see Tonteur again, dimly at first, and for an instant he had the impression that a long time had passed. He picked up his hatchet and his bow and rose to his feet. He had not lost sound of the mill wheel even when Toinette's sobbing had seemed to be at his side. It was crying at him now, but before he turned toward it his eyes rested on Tonteur's wooden peg. It was half cut off, a mark of grim humour on the part of a butcher. The mill wheel was forcing his attention to that fact. "Look—look—look"—it said, and then repeated the old song, calling him an English beast.

He faced it in a flash of resentment, not because of the wheel alone but on account of what lay at his feet and what he knew he would find nearer to the walls of the manor. Between him and the mill was a low current of air with which the smoke drifted in a sun-filled fog which gave to this remaining building an unreal and grotesque appearance. Through the smoke he could scarcely see the wheel as it turned at the top of the tall, pyramid-shaped structure of stone. He was silent, listening for other sound in the sleeping stillness. But his mind was hurling anathema at the wheel. He wanted to tell it that it lied. In this hush of death he wanted to cry out that he was not of the murderous breed who had sent the killers. Proof was over there, in the valley which at last was well named. His mother. His father. His Uncle Hepsibah. Not one of them had been of this breed in their hearts, and all of them were dead by its hand. He had been left alive—by chance. That was proof. The wheel was wrong. It lied.

He looked at Tonteur again strengthening himself to go a little farther and find Toinette. He knew how it would be. Toinette's young body, even more pitiful than his mother's. He forced himself to turn toward the smouldering walls. Toinette—dead! His father might die, and Tonteur, and all the rest of the world—but these two, his mother and Toinette, inseparable in his soul forever, the vital sparks which had kept his own heart beating—how could they die while he lived? He advanced, pausing over one of the slaves, a woman almost unclothed, inky black except the top of her head, which was red where her scalp was gone. In the crook of her arm was her scalpless infant. White, black, women, babies—the loveliness of girlhood—it made no difference.

(Continued on Page 17)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain sees and understands the situation to which her husband is blind. Jeems is brooding over the situation as he, his mother and father and Odd, his dog, walk home from a visit to Tonteur Manor.

On their arrival they find Hepsibah, Catherine Bulain's trader brother who visits them at long intervals. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight.

That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable. Jeems apologizes to Toinette and Tonteur visits the Bulain home where he and Hepsibah have another friendly (?) battle much to Catherine's dismay.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems. Friction between the French and English grows steadily worse and there are rumors of war and massacre. One day Jeems takes a trip to Lussan's and as he returns just at dusk he finds his home on fire.

at the top of the mill. The wide pasture which extended to the river was empty. Cattle and horses and sheep were gone. This emptiness lay over the earth as far as he could see. Death had gone its way as swiftly as it had come, and no enemy remained to exult over what had happened.

As he had stood at the edge of the Big Forest seeking for a figure that might have been his mother's, he now quested for one that might be Toinette's. But the same hope was not in his breast, nor the same fear. Certainty had taken their place. Toinette was dead, despoiled of her beauty and her life as his mother had been. A fury triumphed over him that was as possessive in its effect as the colour which blazed about him in the crimson bush. It had been growing in him since the moment he knelt at his father's side; it had strained at the bounds of his grief when he found his mother; it had filled him with madness, still unformed in his brain, when he covered their faces in the early dawn. Now he knew why he gripped the English hatchet so tightly. He wanted to kill. It was a terrible and totally unexcitable feeling in him. It did not give him the desire to cry out defiance or to hurl himself headlong at something. The passion which consumed him, searing his veins while it left his flesh calm, was a thing whose object of vengeance was not an individual or a group of individuals. He did not analyze the philosophy or the absurdity of this fact, but his eyes turned from the smoke-filled valley of the Richelieu to the south where Champlain lay gleaming in the sun miles away, and the hand which held the hatchet trembled in its new-born yearning for the life blood of a people whom he hated from this day and hour.

He was vaguely conscious of the whine of the mill wheel as he went down into the valley. He did not feel fear or the necessity for concealing his movement, for death would not trouble itself to return to a desolation so complete. But the wheel, as he drew nearer, touched the stillness with a note which seemed to ride with strange

coming as Madame Tonteur had predicted. Toinette had been right. Fiends with white skins, who were of his blood, had sent their hatchet killers to prove it. And like a lone ghost he was left to see it all. The mill wheel knew and, even in moments of quiet, seemed to possess the power to tell him so.

With stubborn fortitude he faced the gehenna through which he knew he must pass before he could turn south to find his vengeance with Dieskau. Toinette belonged to him now as much as his mother, and it was for her he began to search.

In a ditch which had run almost under the eaves of the loopholed church, he stumbled on a body. It had fallen among tall grass and weeds and had remained hidden there. It wore a Mohawk war tuft, and in one of its stiffened hands was another English hatchet like the one Jeems had. A scalp was at the warrior's belt, and for a moment Jeems turned sick. It was a young girl's scalp, days old.

As he advanced, he could see there had been an alarm and a little fighting. There was old Jean de Lauzon, the *cure*, doubled up like a jackknife, half dressed and with a battered old flintlock under him. He was bald, without a hair that an enemy might take, so he had been left un mutilated. He had fired the gun and was running for the fortified church when a bullet had caught him between his thin shoulder blades. Jeems stood over him long enough to make note of these things. He saw several more dark blotches on the ground quite near to where the thick oaken door to the church had been. There were Juchereau and Louis Hebert, both well along in years, and not far from them were their wives. Raudot was a fifth. He had been a slow-witted lad, and now he looked like a clown who had died with a grin on his face. These people had lived nearest to the church. The others had been too far away to answer the alarm quickly, but the result had been the same. Some had come to meet their death. Others had waited for it.

Between this group and the smouldering pile that had been the Manor,

HANDY ANDY Says "Here's How"

To Feed Good Cows on Pasture

By Ray Inman

It pays TO FEED GRAIN TO GOOD COWS ON PASTURE

NOW, MATILDA, HAVE YOU BEEN A GOOD LIL' COW?

OH, YESSIR—I DIDN'T BITE MY NAILS OR MAKE SNOOTS AT NOBODY ALL DAY—HONEST!

GIVE JERSEYS & GUERNSEYS PRODUCING 20 TO 40 LBS. OF MILK A DAY, 3 TO 8 LBS. OF GRAIN A DAY ~ ~ ~ ~

WHY THAT COW IN TH' GRAIN BIN, EARL?

WELL, SHE'S BEEN GWIN' 40 POUNDS O' MILK FER TH' PAST 2 MONTHS—BUT I AINT BEEN FEEDIN' ER NO GRAIN. SO I FIGGER SHE'S GOT A LOT COMIN' AN' I'M KEEPIN' HER IN THERE TILL SHE MAKES IT UP. LOGICAL, AINT IT?

HOLSTEINS PRODUCING 25 TO 50 POUNDS OF MILK A DAY SHOULD GET 3 TO 9 POUNDS OF GRAIN ~

IT DONT SEEM LIKE A EVEN BREAK, MABEL; WE PERDUCE 50 POUNDS O' MILK AN' ONLY GET 9 POUNDS O' GRAIN FOR IT

JUST LIKE I ALWAYS SAID—WHAT WE COWS NEED IS A MCNARY-HOGGIN' BILL!

this is a good mixture

650 LBS. GROUND CORN
250 LBS. WHEAT-BRAN
100 LBS. LINSEED OIL

OR ANY FIRST CLASS COMMERCIAL MIXTURE

YOU BEEN A NICE COW, TESSIE, SO IM GONNA TREAT YOU TO 3 BOWLS O' CORN FLAKES, 5 BOWLS O' PUFFED RICE, 7 BOWLS O' CREAM O' WHEAT, AN' 11 BOWLS O' BRAN FLAKES. AINT THAT SWEET?

OH, MR. ZOOP, YOURS SO GOOD TO ME!

CATTLE

CATTLE

FISHKILL FARMS

offer the following
Yearling Bulls

These fine specimens of the Holstein breed are sired by FISHKILL SIR MAY HENGVERVELD DE KOL. His sire is out of JENNY LINN COLANTHA (30.95 lbs. butter in 7 days at 4 years), she being a grand-daughter of that greatest of all milk sires COLANTHA JOHANNA LAD, through his best son, our former herd sire, DUTCHLAND COLANTHA SIR INKA. On his dam's side FISHKILL SIR MAY HENGVERVELD DEKOL'S ancestry is just as impressive. His dam WINANA SEGIS MAY 2nd (27.42 lbs. butter in 7 days at 3 years, 11 months, 14 days), is a daughter of a full brother to that "Marvel of all Sires" KING SEGIS PONTIAC COUNT whose daughters have broken over 100 world's records.

Sons of "Dutch" Daughters

The dams of these young bulls we are offering are all daughters of the great DUTCHLAND COLANTHA SIR INKA mentioned above, making these youngsters strong in the blood of the greatest of all milk sires, COLANTHA JOHANNA LAD. Read each individual's accomplishments.

FISHKILL PONTIAC DE KOL INKA—dam of FISHKILL COLANTHA PONTIAC, made record of over 20 lbs. butter in 7 days as a 2 year old and 493.72 lbs. butter and 11,012.20 lbs. milk in 365 days at the age of 2 years, 11 months and 15 days.

DUTCHLAND INKA COLANTHA MAID—dam of FISHKILL MAID HENGVERVELD has a fine list of daughters including 18 over 30 lbs. and 2 over 1,000 lbs. One of her daughters, Fishkill Inka Lady DeKol made a 7 day record of 472 lbs. milk and 22.19 lbs. butter at 2 yrs., 11 mos. In 304 days she made a record of 11,741.8 lbs. milk and 550.25 lbs. butter at same age. This was the highest 2 year old fat record in America in 1927 and 1928.

Bred Heifers

FISHKILL MARTHA COLANTHA INKA—born Mar. 20, 1927, bred Feb. 11, 1929. Traces twice to Colantha Johanna Lad. Her dam has a splendid record in Class B, she a daughter of Dutchland Colantha Sir Inka, sire of eighteen 30 lb. daughters.

FISHKILL KORNDYKE MAY SEGIS—born May 8, 1927, bred Jan 22, 1929. Her dam has made an impressive series of records as a two year old, she a daughter of Dutchland Colantha Sir Inka, out of 24 lb. daughter of King Korndyke Sadie Vale 11th.

FISHKILL MAY GENESEE COLANTHA—born Nov. 22, 1927, bred May 19, 1929. Her dam made a record of 436.03 lbs. butter and 9,989.80 lbs. of milk at the age of 2 yrs., 7 mos., 17 days in 305 days—carried calf 223 days. She traces twice to the noted century sire, Dutchland Colantha Sir Inka.

FISHKILL INKA HENGVERVELD—born Dec. 9, 1927, bred June 30, 1929. Her dam and sire are both by the famous Hengerveld Homestead DeKol 4th. Three times she traces to Dutchland Colantha Sir Inka. Her dam has excellent records in every day dairy work, she being from a 24 lb. cow averaging 80 lbs. milk per day.

Dairymen's League Certificates accepted in part or full payment for any animal.

A College Farm Education in Two Years

(Continued from Page 3)

period of decline. On the other hand, the young man who is able, as he looks back on a period of hard times, to see a reaction ahead and a number of years of increasing prosperity, and decides to go into a business at that time, is more than apt to enjoy years of increasingly favorable conditions. The young men who prepare for farming now are very apt to find a gradual improvement in the economic situation for their business during the years in which they are establishing themselves.

Good Farmers Make Money In Bad Times

There is also another side to the picture which has not received any publicity for many years and which it is well to take account of. During all of these years of hard times for farmers there have been some good farmers on good farms who have been making very satisfactory incomes. A great many of these men in New York State are those who have had instruction in the College of Agriculture. While it is not possible to determine definitely how much of a farmer's income is due to his education, there is evidence to show that those farmers with the most school and college training are the ones who are making the most money. It is not differences in the ability to do manual labor alone which determine the differences in the amount of income men are able to make from their farms, but rather it is differences in their ability to know what to do and how to do it most efficiently at the proper time which is a far more important factor affecting profits.

To illustrate this point I may take the case of a man who had a winter course at the college and who spent some time studying as a special student. Last year on his farm he made a labor income of \$8100, which means a return of that amount after paying all expenses and five per cent on his investment. He learned certain things at the college which made this satisfactory income possible. He learned what to do to produce good apples and how to handle them. He did not know much about poultry, but at the college he learned enough to make this a profitable part of his business. He also learned how to feed cows and to keep accounts. As a result of his studies, he increased his production per cow, cut out certain crops that had not been profitable, and increased the size of his business.

Made Income of \$7,000

One of the graduates of the four-year course, who last year made a labor income of over \$7000, learned at the college how to feed cows better than he had known before, how to grow potatoes, how to produce cabbage more efficiently and that if he expected to make larger profits, that he must have a larger business. Now he carries a note book in his pocket and has developed the habit of figuring costs on everything.

Another graduate of the four-year course, whose labor income last year was over \$3700, learned how to judge cows and how to feed them. He decided, as a result of his study, that he needed more cash crops, but he was limited in his acreage of crop land. He, therefore, shortened the rotation, cutting out two years of hay, rented fifty acres of additional land and jumped his acreage of crops from sixty to over one hundred acres. His more efficient method of feeding resulted in an increase of milk production of one thousand pounds per cow and his labor efficiency was increased by fifty per cent.

There are many other illustrations of the results of study at the College which are interesting. Not all who have an agricultural college education make incomes such as these, nor are these the largest incomes being made by college trained farmers; but I have used these illustrations to point out that good men, who thoroughly pre-

pare themselves for their job, are making excellent incomes as farmers at the present time.

Cost Less in Time and Money

The two-year courses, which will start with the opening of College in September, might be looked upon as an adaptation to the general lack of economic prosperity which has prevailed among farmers. They make it possible to secure high grade college work, which is in terms of the most important needs of farm boys, at one-half the cost in time and money required for a regular four-year college course. Regardless of the unquestioned value of the training to be received from the four-year course at the College, if it is within the realm of possibility for only a relatively few farm boys of the state, it is leaving something to be desired for the college education of our young farmers. There are a great many others who would profit mightily if they could take advantage of the best the College has to offer. They will now find in the two-year courses that the opportunity is open to them.

Is there any reason for doubt in the mind of the up-and-coming young man from the farm, who would like to be a farmer, if he could have that good valley farm over there with the fine herd of cows, good crops, good buildings and comfortable home? I wonder if he has thought to find out just where the present owner was at his age, and just how he managed to reach his enviable position of ownership of a profitable farm business. It is difficult for all of us to see the struggle, and to realize the faith and persistence, that successful men put into their business before they are recognized as successful.

Better Times Coming

What is the situation facing this young man who wants to be a farmer to-day? Farm land is cheap compared with most other things, and there is plenty of good land available on reasonable terms. Economists are generally agreed that there is a period of increasing prosperity ahead for farmers. No one expects boom times, but gradual improvement is a very desirable condition with which to be associated. The young man, himself, is just as fine an individual as ever existed in this state. I visited several high schools last spring and was decidedly impressed by this fact. He has spirit and knows so much more about how to behave as a member of a group than when I was in school, that I'm proud of him. He may do some things which older people fail to approve, but that is nothing new. Unless I am mistaken, he has a situation to face which is just as favorable as that faced by many others who have tackled the job of farming and made good. He needs some encouragement and he needs preparation. Training is becoming more and more important in the business of modern farming. It requires business training, technical training in terms of the commodities produced and the machines and equipment used, and training to meet the public and private demands which are made on every successful man who tries to fully meet the obligation of his position in his family and community.

The new two-year courses at the College have been arranged to meet the needs of this young man. If the College can serve him, it is going to do it, for to-day he is recognized as the keystone to the future agriculture of the state and nation.

FARMERS BUY FROM FARMERS

Let us suggest to you as breeders the best kind of a pig to start to raise is a good one. You save time and money. We sell all pigs with a trial of two weeks, and then if dissatisfied, return pigs and we will return your money.

6-7 wks. old, \$4.25 ea.; 8-10 wks. old, \$4.50 ea. Breeds—Chester and Yorkshire cross, and Berkshire and Chester cross, Crating free. These prices F.O.B. our depot. Will ship any number C.O.D. or send check of money order.

MISHAWUN STOCK FARM, MISHAWUN ROAD, WOBURN, MASS. P. S. No pigs sold at the farm; only by appointment.

What Does a "Guarantee" Mean?

Judging from the unsatisfactory experiences of many readers as told to us in letters, there is no doubt but that it pays to buy standard, trade-marked articles. Such articles carry a guarantee, but the best guarantee is the fact that a reputable company that has been in business for years, cannot afford to have a dissatisfied customer.

Letters from subscribers show, however, that frequently they do not understand the exact meaning of the guarantee. As a matter of fact, there are all sorts of guarantees. Some companies, for example, practically guarantee satisfaction and allow the return of goods which do not please the customer regardless of the reason for their return. Perhaps this practice has caused many to believe that the word "guarantee!" always means that they can always return goods and get their money back.

When Goods Cannot Be Returned

A slightly different guarantee, however, which is commonly used with goods where the selling cost is rather high, such as electric light appliances, milking machines, washing machines, radios, etc. states that the company guarantees the product against defective material or workmanship. In other words, they will replace any part which proves to be defective, but will not accept the return of the article and refund the money. In other words, once such a machine is bought it is your property. All the company will do will be to service it when necessary for a certain length of time.

Doubtless this kind of a guarantee is all that can be expected on a relatively large machine which depreciates rapidly once it is put in use and on which the original selling cost is rather high. We do feel that purchasers should realize just what the guarantee means and not expect more than is promised.

Still another form of guarantee means little or nothing. Companies selling material under this sort of a guarantee allow the buyer a certain number of days free trial, but surround the guarantee with so many provisions that it is practically impossible to live up to them. For example, they state that the product must not be shipped back without their permission and at the same time say that it must be shipped back within a certain number of days. Sometimes they apparently forget to give permission until after the trial period is over or in many other cases the buyer simply forgets the matter until it is too late and is informed that the company cannot accept the return of the goods because they have kept them too long.

Tiring Out a Customer

Still other companies apparently follow a policy of tiring out the customer. They guarantee their product but when the complaint is made they write lengthy letters supposedly with the idea of finding out just what is wrong until finally the customer gives up in despair and charges it up to profit and loss.

We are simply trying to point out that after all a guarantee depends upon the company which is back of the product and that all guarantees are not equally valuable. When someone

tells you that their product is guaranteed, inquire into the product a little more fully and see what the company agrees to do in backing up their promises.

"Buy Back" Scheme Again

A while ago I answered an ad in Farm Life from the Western Fur Farms who raise chinchilla rabbits. They agree to a buy-back contract to buy the offspring for three years. I would like to know if this company is thoroughly reliable.

ALTHOUGH a number of companies continue to sell stock on a buy-back arrangement, we have yet to find one that thoroughly lives up to their guarantee. The very nature of the case indicates how difficult it would be

We Are Glad To Help

My apple trees arrived in good shape, thanks to your prompt attention to the matter. I feel certain if you had not taken it up for me with the... nursery, I should never have received them. Thank you very kindly for your prompt service.

for them to do this. Rabbits multiply rapidly and the only way a company could guarantee to take offspring for three years would be to extend their business as rapidly as the rabbits increased in numbers.

The experience of our readers who have bought rabbits or other stock, expecting to sell back offspring is that some way is always found to avoid the obligation. Either the rabbits sent are not up to weight or other specifications, or the company has gone out of business by the time they have stock to sell back to them.

Selling Books or Buying Butterflies?

What can you tell me about a Mr. Sinclair, of San Diego, who advertises to buy butterflies and moths? I answered the ad and he asked for 10c for an illustrated catalog. I sent the 10c and now he wants \$6.00 for an instruction book and says he will gladly refund the money after I have sold him enough business to justify it. He sends a lot of names of

people who have made money at this work but does not send their addresses. Do you think we should pay \$6.00 for this book?

WE suspect that Mr. Sinclair is primarily interested in selling his book rather than in buying moths and butterflies. Anyone who wishes such a book may find that it is worth the price asked although it seems rather high, but we suggest that they do not plan to pay for it with moths and butterflies sold.

Get the Facts Before You Buy Stock

THE Rochester Better Business Bureau suggests that the following information should be obtained by all persons interested in buying stock of any particular company before they part with their money:

1. Name of concern and officials.
2. Bank and other references.
3. Present assets and assets of company when organized.
4. Liabilities.
5. Earnings of the company.
6. Dividend record.
7. Business records of officials.
8. Approximate promotion costs.
9. Value of security as collateral.
10. Selling market.

Representatives of reliable concerns will willingly give the above information when asked.

The Plains of Abraham

(Continued from Page 14)

Jeems scanned the earth beyond her, and where the smoke lay in a white shroud he saw a small, slim figure which he knew was Toinette. Another young body might have lain in the same way, its slenderness crumpled in the same manner, a naked arm revealed dimly under its winding sheet of smoke. But he knew this was Toinette. The dizzying haze wavered before his eyes again, and he put out his hand to hold it back. Toinette. Only a few steps from him. Dead, like his mother.

Odd went ahead of him halfway to the still form and stopped. He sensed something Jeems could not see or feel through the smoke mist which undulated before their eyes. Warning of impending danger confronted the dog, and he tried to pass it to his master. In that moment, a shot came from the mill, and a flash of pain darted through Jeems's arm. He was flung backward and caught himself to hear echoes of the explosion beating against the forested hills and the wheel at the top of the mill screaming at him.

The Sign of Protection

Hen Health

(Continued from Page 3)

is foolish to change, even if someone has had good results with some other ration. Food which is musty, moldy or spoiled must be avoided. Care must be taken that if wet mash is fed, it has no chance to sour before the hens eat it. Plenty of green feed is important.

Stagnant Water May Cause Disease

An abundant supply of fresh, clean water is necessary. Stagnant pools in the henyard are frequently a source of disease and drinking fountains in the house are easily contaminated if any hen gets sick. For that reason, it may be advisable to put a harmless disinfectant into the drinking water. Potassium permanganate is most often used, dissolved in the water in sufficient quantity to turn the water a deep wine color. This does not act as a medicine for the hen, but it does prevent growth of bacteria which get into the water and which may spread disease from hen to hen.

Some poultrymen in recent years have followed the practice of giving epsom salts to the flock once a week, either in wet mash or drinking water, about one pound to one hundred hens. It is said that this keeps the digestive system in such good condition that they are much less likely to contract diseases.

The third point to watch is the land about the henhouse. Where a few hens are kept, this almost never causes trouble but where from five hundred to one thousand hens are kept in one house, it becomes a problem. One comparatively easy way to manage this is to have a fence going from each end of the house to a distance sufficient to keep the hens from going around it. The hens can then be allowed to range first on one side of the house, then on the other. Where grass is growing, little danger exists, but grass will not grow next to the house when hens have free range, and the constant travel of the hens puddles the top of the soil so that rainfall does not purify it readily. Better drainage, of course, is secured where the soil is sandy or gravelly.

Cultivation Keeps Soil Clean

Where it is at all possible, nothing is better than plowing the land. This allows air and sunlight to enter, and the purifying of the soil may be still further increased by the addition of lime to the soil. Where no attention is given to keeping the land clean, there will be trouble sooner or later. It may not come for several years, but just when you feel secure, look out for a bad outbreak of disease.

If hens are to remain healthy they must exercise. They will do this without attention when they have outdoor range, but during the winter, it becomes necessary to keep clean litter before them. If hens are vigorous and healthy, they will exercise if conditions are favorable for it.

Parasites not only cause a drop in egg production, but also weaken the hen so that she is more likely to be attacked by disease. External parasites are not difficult to control if the work is done at the right time. The man who doesn't have time to do this, should not try to keep poultry. Internal parasites do not cause much trouble where the hens are kept in a healthy condition. It is more difficult to tell when they are present, and more difficult to treat them, but it can be done and should be attended to, if their presence is suspected.

Keep Disease Away from Flock

When all the things already mentioned have been done, there still remains the important point of keeping disease away from the flock. Even if they have been bred for vigor and have been kept under the best of conditions there is no necessity of unnecessarily exposing them to disease. Bury or burn all dead birds. They may die from a non-infectious disease, but why take chances?

All hens that seem to be sick should be removed from the flock. One of the disadvantages of treating such

hens is that the "cured hen" may still be able to spread disease among other hens. If they are doctored, keep them away from other hens. If they die, either naturally or from the hatchet, bury them.

When birds are purchased, keep them away from the flock for a week or two till you are sure they are not developing some disease. The same applies to hens that have been away from home to shows or fairs. If your neighbor reports trouble with his hens, do not look them over from idle curiosity. If you can help him, at least take all necessary precautions to see that you do not bring some disease to your own flock.

The profit from any business can be increased by stopping the leaks. One of the leaks in the poultry business is death of sick birds. We may never be able to eliminate it, but it can be greatly diminished.

The divine injunction to the father of the race was to "till the ground from whence he was taken." What more happy or useful privilege can come to the children of men than to fulfill this command by unity of action and harmonious cooperation.

Harvest Your Fodder Crop On Time with McCormick-Deering Equipment and Power

McCORMICK-DEERING Corn Binders

McCormick-Deering Corn Binders are available in horizontal and vertical types. Famous for dependability, durability, for fast, sure cutting, and good binding. Choose your machine at the store of the McCormick-Deering dealer.

McCORMICK-DEERING Ensilage Cutters

Be sure to see the new, perfected No. 12 Ensilage Cutter. No gears to change . . . length of cut controlled by a shift lever. Automobile-type transmission with enclosed gears. Reinforced, boiler-plate flywheel. Shaft revolves in ball-bearings. Many other features.

Avoid Silage Mold, Decay, Spoilage, and Over-Acidity Caused by Cutting at the Wrong Time

GOOD AUTHORITY SAYS, "The proper time to cut corn for ensilage is when it shows the first signs of ripening . . . when the husks begin to turn yellow at the ends and the kernels are entirely past the milk stage, glazed and dented."

If inadequate equipment compels you to begin cutting earlier than this stage, you lose palatability and nutriment, and the chances for over-acidity and decay increase. On the other hand, a delayed or slow harvest permits the crop to dry out, thereby increasing the danger of silage mold due to lack of moisture.

The short allotment of time favorable to making ensilage calls for a fast-working, dependable McCormick-Deering Corn Binder working in the field in advance of a McCormick-Deering Ensilage Cutter. The McCormick-Deering dealer in your town will tell you all about these machines and the tractors that go with them. Complete information sent on request.

Ellis Champion Threshers For the Individual Farmer

The Thresher that can be successfully run with a popular sized tractor is a great investment. It will pay for itself in two years' running. Our long experience in building small threshers has enabled us to offer a REAL CHAMPION.

A big guarantee accompanies each machine. We build four sizes, which, depending on the attachments and equipment ordered, require from 3 to 30 horse gasoline engine power. Wood or Steel Frames, light in weight, simple in construction, durable, requiring a minimum of power, yet doing exceptionally clean work. Our prices are right, and we will be glad to furnish details and literature upon request.

*Oh! the old swimmin'-hole! In the long, lazy days
When the humdrum of school made so many run-a-ways,
How plesant was the jurney down the old dusty lane,
Whare the tracks of our bare feet was all printed so plane
You could tell by the dent of the heel and the sole
They was lots o' fun on hands at the old swimmin'-hole.
But the lost joys is past! Let your tears in sorrow roll
Like the rain that ust to dapple up the old swimmin'-hole.*

NEY

A. P. Marshall says

"Increased production paid for Ney Equipment"

TWENTY-TWO Ney stalls, stanchions and water bowls were installed in the dairy barn on Mr. Marshall's Smicksburg, Penna. farm. In twelve months time the whole cost was returned through increased milk production alone. And Mr. Marshall had big savings in time and labor as added profit. More Ney equipment has already been ordered by Mr. Marshall.

Connecticut's Agricultural Policy

Farm Organizations Make Recommendations

AN agricultural policy for Connecticut in relation to leading problems confronting the dairy, fruit, poultry, vegetable, tobacco and the potato interests of the state as well as policies in land utilization, farm management and education, was formulated by 70 delegates from various agricultural organizations throughout Connecticut at the Connecticut Agricultural Policy Conference which closed August 10 at the State college. The conference sponsored by Irving G. Davis, head of the college economics department, considered the outstanding movement of the day in any state in connection with securing a definite program for the agricultural work of a state.

By NATHAN KOENIG

Provision was made for the appointment of a special committee to study the tax situation in-so-far as it relates to the agricultural industry.

Supply the Milk Market

That there is a need for farmers to produce an adequate supply of fluid milk to meet the demands of Connecticut markets, was stressed by the dairy committee in its report. According to the members of the committee, this is necessary to protect the market for Connecticut milk producers and prevent the importation of fluid milk. A need for the continuance of an aggressive policy of tuberculosis eradication by the area testing policy was emphasized. The dairy committee also stated the need for payments for milk on the basis of sanitary quality as well as butter fat content. A continued evening of seasonal production, further education in the advantages of collective action in milk marketing and the need for improved dirt roads in the dairy sections of the state, were brought out by the dairy committeemen.

A focusing of attention on the imperative need for technical research in the field of poultry pathology, and a wider dissemination of information already known to be helpful to the poultry industry, was recommended by the poultry committee of the state agricultural policy conference. The members agreed that present and prospective poultrymen in Connecticut be encouraged in all legitimate ways to breed hens with higher, average egg production and increased quality product. Recommendations were made to the effect that continued and increasingly greater emphasis be placed on the matter of marketing and adjusting quality and seasonal distribution to the needs of the people, in the firm belief that cooperative and co-ordinated efforts will benefit both producers and consumers alike.

Many Organizations Represented

The conference was composed of men and women designated as representatives by the state grange, the farm bureau federation, farmers' co-operative associations, county farm bureaus, state agricultural societies, the experiment station, and the office of the state commissioner of agriculture co-operating with officials from the United States Department of Agriculture. More than 150 persons assisted in the deliberations of the conference during the three days of the various sessions which ended Saturday. The conference was devoted to an appraisal of problems affecting the net income of Connecticut farmers. In committee reports approved by the conference, conclusions were reached as to the many leading agricultural problems.

The conference recommended the segregation of lands suited for agricultural use from those for other uses. It was further recommended, as a first step in the development of a state land policy, that a state wide soil survey be inaugurated. The conference went on record as supporting the state's policy of purchasing non-agricultural land for state forest areas. In several of the committee reports accepted by the conference, the need for low cost production of high quality farm products, adapted to northeastern market requirements was stressed. In planning a production policy it was agreed by the various committees that the use of farm accounts and accounting would materially increase the net income of a great many Connecticut farmers.

More research work in connection with disease and pest control with relation to economic problems, and the need for more complete and accurate information on crop production and factors of supply and demand, was recommended as a Connecticut agricultural need.

City Markets Need Changes

Reorganization and standardization of public city markets in view of the present existing complicated conditions in this state, was approved by the various delegates. A rapid improvement of rural roads, a problem which has received little consideration from state officials, was stressed as a factor for the improvement of the net income of the Connecticut farmer.

The conference went on record in favor of provision being made for education in matters of public policy affecting agriculture, such as better roads, reforestation, taxation and the inadvisability of expanding the country's farm land areas by reclamation projects. According to an agreement reached, it is the function of farmers commodity organizations, and not of public educational agencies, to educate the consumer in the use of the several farm products, except as such education may pertain to public policy such as health or police service.

In connection with the problem of taxation which received a great deal of consideration, the opinion prevailed that farm leaders are not sufficiently informed regarding the facts of the situation to make possible immediate appraisal of the problem of taxation.

Tobacco Extension Specialist Recommended

In view of the present calamity in the tobacco area the report of the tobacco committee of the conference as secured by the *Herald* should be of special interest to Connecticut Valley farmers. The committee recommended the adjustment of production to the demand in order to produce the proper supply of the most profitable qualities of tobacco. This involves more complete and accurate information regarding demand, and a study of lists of production. Methods which will tend to reduce costs of production of the crop were recommended. This involves an increase in the amount of extension work to be done in the tobacco area. In order to bring this about, the committee recommended the employment of a tobacco specialist by the extension service of the state agricultural college for the state's \$10,000,000 industry. That changes in the organization of tobacco farms are necessary to keep production in line with demand and to result in the lowest costs and the highest income per farm, was stressed by the tobacco representatives. These changes in organization may involve combination of farm areas, and the introduction on many farms of new enterprises.

The provision of credit facilities for the tobacco farmer and the organization of credit institutions to make possible and promote the needed reorganization of production and marketing, was emphasized by the tobacco committee at the agricultural policy conference.

Fewer and Better Varieties

Fewer and better varieties of vegetables was urged by the vegetable committee in formulating a policy for the Connecticut vegetable industry. The committee felt that the information regarding insect and disease control is

Those Inland May Feast on Shore Dainties

Fresh Sea Fish Now Goes Where It Never Could Go Before

By MRS. GRACE W. HUCKETT
Household Editor, American Agriculturist

SOME of us who were brought up far inland before the days of refrigerator cars or even common use of artificial ice, can remember what a treat it was to have fresh fish of any description. One of the great social events of the countryside was a "fish fry" on the banks of a creek or river. The men of the party met early and attired in their oldest pants or overalls, seined for our dinner. That was, of course, before state authorities woke up to the fact that even fishing needed regulation. Naturally the real fishermen used hook and line but if the worst happened and the fish refused to bite, then the practical result-getting bunch resorted to the surer method of delivering the fish into the frying pan. And it was an event to be remembered when the crisp, golden brown, delicious smelling fish were passed and eaten with great gusto by one and all.

For years now markets in even small villages within two or three hundred miles of the coast could have regular days for handling deep sea fish shipped in ice. In cities where the demand has been great, it has been possible and profitable to market sea food at practically any time of the year. And now comes even greater change in the method of providing a fish-craving public with the delights of the deep.

Instead of piling the fish indiscriminately into barrels of ice and shipping them whole as formerly was considered adequate for keeping them at least edible, the modern way makes it much easier for the housewife. Instead of having to go through with the business of cleaning the fish, now the housewife can obtain the clean, white "fillets" or pieces of fish which represent the only edible portions of the creature. Straight from the sea to the packing house the fish come and

often in two hours' time the heads, tails, fins and other waste are removed and the "clear" meat neatly wrapped and packed, ready to start to the consumer. The waste is thriftily manufactured into fish meal or fertilizer: this may be a little hard on the family cat, but is a far better use for

the edible portions of the fish. Just as is true with the meat packing industry, it is very necessary to have some satisfactory means of disposing of the waste which amounts to from 40 to 60% in making fillets of the fish. The fish are gutted at sea, so the waste which is converted into fish meal or fertilizer is from bones, heads, fins, skin and cut portions of the fish.

Various methods have been developed for getting the fillets or "clear" meat of the fish to the consumer without loss of flavor or firmness. Fish has delicate cell walls; when frozen slowly large ice crystals form which break down these cell walls. Then when the fish thaws the juices leak out, causing a flavorless product when cooked. Quick freezing at temperature below zero forms small ice crystals which do not rupture the cell walls. In this way, the fish retains its fresh flavor and firm texture.

Each concern has its own fleet at work, brings in a boat load of fish and in a few minutes after tying up to the dock, has the load cleaned, boned and filleted and ready to move on its way to the consumer. One concern wraps two fillets to the package in parchment paper and puts several packages in a tight can stowed in an iced box of tin. This prevents the fish from coming in direct contact with the ice which is a great improvement over the old days of jamming fish and chunks of ice together in a barrel. This type of filleted fish is fresh fillet as distinguished from the frozen or "frosted" fillet.

Another firm, after cleaning and cutting the fish into fillets, freezes, wraps, boxes and ships them in a new type of refrigerator car. By making use of silica gel to help along the refrigeration process, the new cars can travel thousands of

In these days of speed with steam trawlers for fishing, this picturesque old type of fishing schooner captain is fast disappearing.

Health Is A Most Precious Asset

Shall The Rural Districts Continue To Be Penalized?

UNDOUBTEDLY, the question of health is one being discussed more than ever before, especially rural health. And it is being discussed in quarters where sooner or later something will be done about it. The women are talking, in women's clubs, in home bureaus, in political circles.

There is a reason for this. Although sickness is a grave community problem shared by everybody, the burden of it falls on the women. Theirs is the task of nursing the sick, of keeping the family well and of bearing the children. So the women have a right to talk—they'd do it anyhow, God bless 'em!

Furthermore, talk is not limited to the women. Men are quick to see the economic losses entailed by sickness of themselves, their families or employees. Mr. Homer Folks, Secretary of the New York State Charities Aid Association has estimated that the average cost of sickness per year is \$31.08 per person in the United States. Add to this the loss of future wages and the total loss per person is \$131.00 per year. He arrives at these figures after a detailed study of actual conditions in various parts of the country.

From the nature of the case, the rural sections have a harder health problem than the cities have. Because of scattered families, low assessments, poor roads, and many other factors which enter in, often there is no doctor or hospital available, no matter what the emergency may be. It is a problem not to be solved by any one individual; each community will have to meet it

for itself sooner or later. Some have already banded together and pooled their resources in order to guarantee a living to a doctor.

One case which has come to our attention and which seems full of possibilities for guaranteeing medical service to those belonging is the Co-operative Health League idea. Each family pays, say, \$25.00 a year and in return gets a complete yearly physical examination, and necessary medi-

country practice. It also would give a member family a feeling of protection.

Dr. Milton E. Gregg of Mottville, N. Y. in presenting the idea of constructive rural health work to the state conference of health officers and public health nurses said:

"We should utilize the services of any physicians now engaged or who may be induced to engage in rural practice, and they must not be

supplanted or their hands tied by any supervising or centralized agency. We should also utilize the services of nurses, specially trained by the state or otherwise in various health activities—notably the diagnosis and control of the communicable diseases, the supervision of the milk and other food supplies, the proper disposal of human excreta and filth in pre-natal and care after birth, the diagnosis and treatment of the early and late toxæmias of pregnancy, and skilled in the administration of prophylactic (disease-preventing) measures such as diphtheria and tetanus antitoxin, toxin-antitoxin, typhoid vaccine, etc. In such areas as cannot hope for the restoration of resident physicians such specially trained

nurses should be appointed as health officers and paid wholly or in part by the municipality served, thus using at home moneys now being paid to non-resident health officers. Her work under such conditions would be greatly facilitated by providing health units—small buildings designed for the purpose or modified dwelling houses often obtainable in rural villages at small cost. These

(Continued on Page 7)

What Are We Going To Do About It?

THE other night a little friend of mine, maybe seven or eight years old, was taken violently ill in the middle of the night. His temperature was dangerously high and he was so sick that he was out of his head. He was located in the country six or eight miles from the nearest dependable doctor. The doctor on one side is a man over eighty years of age who has spent a lifetime driving the hills and serving his people. He can no longer take long drives in the night even in an emergency. The doctors in the distant village on the other side have more than they can do. The result in this particular instance was that no medical service could be had for the small boy in the night, and had his life depended on it, he would have died.

This is not an extreme example of what is taking place very frequently in many country districts because of the shortage of doctors. What are we going to do about it? If the State assumes the burden of paying and regulating doctors then we have paternalism, too much government and too little chance or choice for individualism.

Possibly the suggestions in the accompanying article may appeal to you. At least they will set you to thinking, and this problem of country health service is something that we must give immediate thought to.—E. R. Eastman.

cal treatment during the year. This applies for ordinary illnesses, but for such extras as setting broken arms or legs, giving anaesthetics, assisting at operations, etc. an extra fee is charged but reduced from the usual price. The contract between member families and the doctor states all the terms clearly. In this way a rural physician, having some guarantee of a minimum salary, would feel more disposed to remain at

Are the Little Folks Ready?

OUT of the great number of little folks who start to school for the first time, how many of them are really ready for the experience? Is the child a "mama's-boy"? Has he been taught to rely on himself and to meet strangers without fear? The experience that some teachers have trying to console frightened children and get them adjusted to school conditions might be much easier if the child is prepared for this new phase of his life.

Not only does he need to be physically ready for school, with all handicaps removed such as bad tonsils or adenoids and teeth put in good condition, but his attitude of mind towards school has to be prepared somewhat. The idea that school is disagreeable and irksome is usually planted in a child's mind by its elders. The feeling that going to school is a chance to find out many things he wants to know is just as easily instilled into him. Truly, children are great little reflectors of what they see and hear about them. —G.W.H.

How the New Tariff Bill Would Work

THE newspapers are having much to say about the new tariff schedules which have just been announced by the United States Senate. Possibly a little review of the situation may be helpful.

Two general methods for farm relief have been considered by the Federal Government. One was the Federal Farm Relief Act and the formation of a Farm Board under this act. Members of this board have been appointed and are now working.

The other proposition was to increase tariffs on farm products. However, when the House of Representatives came to consider tariff schedules, much pressure was brought by industries other than agriculture to increase the tariffs on many manufactured products including those bought by farmers so that when the House of Representatives announced its new schedules, it was found that it had raised about a thousand rates of the present law's twelve thousand. This brought a storm of criticism from nearly every farm organization. If passed, the increased schedules would injure agriculture far more than it would help it.

Then the Senate Finance Committee began its

tariff sessions and after several months' work, it has changed four hundred thirty one rates of the House bill. Most of these changes were downward a little although cotton fabrics and hides were raised. The Senate lowered the House rates on sugar which will be of general interest to every consumer.

The Senate bill is an improvement from the farmer's standpoint over the House proposals but it is still probably true that if the bill in its present form passes, it will raise the costs of many of the supplies which the farmer buys more than to offset any good that he might receive from the increases proposed on the products that he sells.

Short Courses in Pennsylvania and Other Agricultural Colleges

IN a recent issue we told something about the new two-year courses to begin this year at the New York State College of Agriculture.

Residents of Pennsylvania also have this same opportunity of getting a first class training in agriculture in two years at the State College. All of the agricultural colleges have various kinds of short courses and if you are interested, we suggest that you write your own college for detailed information.

These short courses offer a splendid opportunity for the young man and the young woman to prepare themselves for the great job of farming and to do it in a short time with small expense. No tuition is charged by any of the state colleges for residents of their state.

It is possible, of course, to make a success of farming without going to college. Not all education is obtained from books by any means but education does help, particularly the practical kind that you get from the short farm courses. More and more it is going to be difficult to meet the problems that the farmer is called upon to face without some scientific training.

How About That St. Louis Trip?

INQUIRIES coming into the A.A. office every day show that interest in the A.A. New York Central Excursion Train to St. Louis is increasing and the indications are now for a large party and a splendid time.

As we have pointed out several times before, here is an opportunity for the dairyman and his family to get a much needed vacation, learn a lot, and have a good time. There will be something doing in the way of a program from the time you get on the excursion train until you get back home. All of the details of the trip will be taken care of so that there will be nothing for you to worry about and by going in a party at the excursion rate of a fare and one-half, expenses will be kept at a minimum.

For further particulars, write AMERICAN AGRICULTURIST.

Stored Sunshine in Milk

EVERY child is taught in school that there are six main colors—yellow, red, green, blue, orange and violet—in the spectrum, and that all other colors are combinations of one or more of these six. Sunlight is a combination of all of them, and when the sun passes through thick glass or through the rain drops, the colors are sometimes broken up so that we can pick out the separate ones in the rainbow.

However, the sun contains some very important rays that cannot be seen which have a tremendous effect upon life. The heat rays of the sun are invisible, as are also what the scientists call ultra-violet rays, meaning beyond the violet. There is a certain substance called ergosterol found, among other places, in the skin of man and other animals, and in the liver of the codfish, which has the faculty of turning the ultra-violet rays into vitamin D. This vitamin D is absolutely necessary for the proper growth of bones. When

a child does not get enough sunlight, or enough food rich in vitamin D, then his bones do not make the proper growth, and he may develop what is known as rickets, or may be sickly in many other ways such as being overly susceptible to colds.

Our fathers and mothers knew that cod liver oil was a wonderful medicine for sickly children, and they know that even for those who were not sick it acted as a preventative. Scientists have since determined that cod liver oil contains great quantities of vitamin D or stored sunlight.

It has been known by the doctors for many years that sunshine and the proper food were about the only cure for consumption, but they did not know until recently that the reason for this was that the sunshine acting on the ergosterol of the skin produced vitamin D in the body, which helped to produce growth and ward off disease.

All of this is especially interesting to dairymen because it has been found that milk contains vitamin D especially in the summer time when the cows are out in the sun all of the time. It is interesting also to know that the scientists have been able to take certain foods and put them under "sun lamps", or artificial sunlight, and give those foods a larger content of vitamin D.

Sometime we are going to know infinitely more about this whole matter of diet and be able to control all of the vitamins so that in time to come sickness will be largely prevented through the better knowledge and use of the foods we eat.

Grown-Ups Can Get Betty's Scrapbook

OUR big girl readers are just beginning to wake up to the fact that if they really want one of Betty's recipe scrapbooks, they can get them too. Although the recipes are written and explained so a little girl of eight can understand them, they are equally as good for the grown-up cook who wants to know the correct way of making even the simple dishes. Just to show that the mothers know a good thing when they see it, some of them have written for the scrapbook so they can keep the recipes in good shape for their children now only a few months or very few years old. These recipes will be good for a lifetime. Furthermore little boys enjoy making things to eat as well as little girls do. —G. W. H.

Fall Is Ideal for Many Plantings

IN pioneer days of any country the grim business of getting enough to eat occupies most of the time. As circumstances become easier there is more opportunity to beautify the surroundings. Even though making a living is yet of necessity the prime business of most of us, the time has come when more attention should be given to making homes and grounds attractive.

In many cases, painting is done, new buildings are added, shrubs and flowers are planted anyhow; the only thing lacking is that these efforts are more or less haphazard. A definite plan will tend to build a unified, pleasing whole rather than a lot of "scrappy" looking pieces of a farm homestead of unrelated houses and grounds.

Fall is a good time to do some permanent planting of shrubs, bulbs and a few perennials: look to the effect they will have on the whole layout—but now is the time to do it.—G.W.H.

Aunt Janet's Chestnut

"SO you have got twins at your house," said Mrs. Wheeler to little Tommy Jones. "Yes, ma'am, two of 'em." "What are you going to call them?" "Thunder and Lightning." "Why, those are strange names to call children." "Well, that's what pa called them, as soon as he heard they were in the house."

Letters from Homemakers and Husbands

Readers Discuss Problems of Home, Farm and Community

THE reader who sent the following letter expresses a feeling that belongs definitely to the members of the A. A. staff, namely, that A. A. writers and readers alike form a great big circle of friends with common interests, common problems and common joys.

"I want to tell you, dear Editor, that the A. A. gets better every week. It takes us away from ourselves by showing us other places and people, giving that bigger outlook on life that is so needed among country people.

"Its farm writings are always complete, its home life shows the best, your paper is so entire in itself it would be a very great loss to be without it, for each week it is so worth while, the spirit it carries is like hearing from a lot of old friends.

"May you all be given many more years to carry on and enjoy your noble work, which does mean so much to this great farming nation.—MRS. J.L.F."

* * * * *

Husband and Wife Cooperate

THIS reader hits the vital point, the thing that really matters in the question of how the work should be divided on the farm. The spirit of the thing is what counts; a willingness to share one another's burdens warms the heart and makes one feel appreciated—that makes the task lighter.

"Men should help the wife inside the house on many occasions. I believe we can all get a little help from our husbands by showing an interest in his work when he is at his busy season. I have helped outdoors with every kind of farm work. I was raised on the farm and it is only a game of play fair to me, as I was raised that way. By playing fair we were taught the word co-operation by old timers long before the word was used daily.

"But without co-operation the husband is poor stuff. My husband has done the dishes hundreds of times and before I purchased a dish-drainer he always dried the dishes if he was at the house. Now a few minutes are all that is required to do them, since by scalding them after they are washed they dry themselves and we both have more leisure. A man will buy you these conveniences for your home if you show him how cheap they are, and the labor they will save both of you. Husband reads to me most of the time of evenings while I do the dishes. That's real life. He dresses one of the twins while I dress the other. He does a lot of things that require time, such a peeling apples, potatoes and setting the table. He does the milking when he can. When the days are short I do the milking evenings before I start supper and he mornings while I get breakfast. That's co-operation again.

"You may try to solve the problem as you will, but there is just one way to get his help and that is by helping him. I find a few hours every day that I help him. It is usually right after dinner, or if he is hauling hay to market I help load his hay wagon then resume my household duties. When he returns if it is evening he does the chores while I get an early supper. If he is late I do the chores. On holidays I spruce up the table a little with a dainty dish and find he gives me a happy look for it, sometimes a kiss and a little praise. We co-operate in every effort and find it pays.—C. Z."

Where Is a Good Place to Live?

FARM folk are busy folk; there is always more to do in a day than can get done. But much of it is routine work and after the job is well started, the rest can be accomplished without devoting a lot of active mental effort to it. This gives the farmer or his wife time for revolving in his or her mind plans or ideas or for just plain philo-

sophizing—"projeckin'"—the colored folks call it.

Whether the resulting philosophy is kindly or unkindly in its nature, whether bitter and critical or generous and willing to make allowance depends upon the nature of the philosopher. But taking them by and large, "the run of the field" as applied to farmers as a whole, it seems that they usually hit on the vital point of a situation. Take these two letters telling what these farm women consider really important in any neighborhood:

"To the Editor's and Mr. Ladd's list of things which go to make an ideal community I would add one which has always seemed to me to be the great lack in so many rural communities. That is loyalty to the community in which one lives. The community that develops this loyalty complex as it should is pretty well along on its way to getting the things needed to make it an ideal place in which to live. The idea that the big city or some other place far away is a better place in which to live than the town in which one's lot has been cast is the bane of most small communities. After all, home and happiness are largely states of mind and one may find as absorbing interests in the life of a healthy country town as in the big city if one looks at life from the right standpoint.

"Were I looking for a place in which to buy a farm or other home as I went about and talked with people their attitude toward their home town and its life would go a long way toward making a decision as to whether or not it was a desirable place in which to locate. Did they manifest a live interest in the place and in the things calculated to make it a better place in which to live and a laudable desire to overcome what natural handicaps it might have? If so, I would much prefer to buy property there than in a section where everyone was rapping the community and everything connected with it, although it might have natural advantages far above the other communities. When I attend meetings or ramble around in a community and hear its preachers and other so-called leaders continually plead for far away things and without ceasing, rap their home town and its interests and never once lift up their voices for the advancement of the community or the preservation of its perhaps priceless tra-

ditions, I do not wonder at the decay of rural communities.

"It is as true today as when written a good many hundred years ago that 'When there is no vision the people perish.'—M.M.C."

* * *

Neighborliness Comes First

THE things Dr. Ladd mentions are all good, very necessary and desirable. I can see for myself if they exist. But there are some things I cannot see that make a neighborhood good or bad. I should very earnestly inquire, "Do the residents of this place live in peace, friendship and neighborliness among themselves or do they back-bite? Do they lie about each other? Do they call names? Do they fight? Do they have law suits and drag others into court and so make more enemies?" It is not school, good roads, community houses or even churches that make a neighborhood a desirable place to live in. It is the residents of that community and on them depend if it is to be a desirable place for either old or young.—A.P.M.

What Makes An Ideal Wife?

THIS page of letters is not complete without an expression from the men. Everybody, man or woman, has opinions as to the qualifications of the ideal wife. But here we see what two of our men readers consider the outstanding characteristics which they require of their ideal wife.

* * *

"I married her eight years ago and she is, to my mind, more ideal than ever. She is a good sport. When anything goes wrong she *always* meets an emergency with a grin—an honest cheerful grin, and refuses to be discouraged. She is Truth itself—no deceitful half-way measures in her dealings. She demands absolute honesty from me and the children and is as honest with us. She is fair-minded and never believes anything bad of a person until she hears both sides of the story. Her motto is B²—be square. She is sympathetic, tenderhearted and even-tempered. She possesses a temper but controls it well and has influenced me to greater self-control, also.

"She is systematic, clever, sensible and careful with money. She is deeply religious and believes in the Golden

Rule. She can cook, keep house well, keep us all neatly dressed and when necessary can don knickers and give me a hand with my work. She is essentially feminine, for all of that, and I (naturally, I suppose) consider her the most perfect and the most beautiful of all women. I firmly believe that ours is a perfect marriage.—W.R."

* * *

A Smile Helps

THE ideal wife is supposed to be one who can smile when the cake burns, while she cares for baby, can smile while breakfast waits half hour while the Boss and his neighbor discuss merits of the pool versus the non-pool.

Still smiling she helps the children find the numberless missing caps, books and mittens, before starting for school. The smile is less than a mile of smiles when the clock tells her time is short for the mountain of work before dinner.

When the husband and his help trail their muddy boots over her white scrubbed floor, the lord of the manor looks at his smiling wife and congratulates himself once more at the rare judgment and wisdom he possessed in choosing a wife. "Why," he thinks to himself, "the children and work don't seem to worry her at all."

Let us be thankful for the merciful darkness at 11 P. M. when she turns out the light, after doing the necessary mending. The tired lined face can't be seen and methinks I hear the earnest supplication "Oh Lord, give me strength to carry on."

That is not the picture of an ideal wife. That is the picture of a martyr. My idea of a wife is one who shares the love and companionship and society of her family and she shares the labor with the growing boys and girls and has time to enter into their pleasures and meets their friends and invites them into the family circle. By so doing, she makes it plain to them that only by their co-operation in being orderly and having a place for all their personal belongings (the old man too), by being economical in spending their nickels and dimes, and in sharing the work, inside and out, in this way only can a family of limited means compass the many pleasures. In getting close to the boy or girl can the true rounded life of the home be made possible.

I don't care if the neighbors don't call her a good housekeeper and if there are fly specks on the window and the floor has not been scrubbed today, if she is a good scout with husband and children, good plain cook, good wife and mother, that is all I want.—F.J.G.

If I Had a Year to Do As I Pleased

IF I could have twelve months to do as I pleased I would go at once to a good college in a city. There I would have everything that my heart has craved for years, study, observation, opportunities and advantages. Having left school at the age of fifteen with a very busy life since, it would be such a joy to enrich my mind with hard study, good music, good lectures, hours for meditation and the chance to mingle with well informed people. I would forget housework for that period and revel in intellectual things. I have always longed to see what could be done for one who has had nothing of college work, and whether my life could not be made more efficient and happy by knowing more, even after youth is past. And I feel sure I should not fail, as I have been dreaming of such a year a long time and getting ready for it quietly by taking advantage of every good thing that comes my way. It may never happen as I have planned, but at least it has made many a dark day brighter and has sweetened the whole of life to get ready for it.

My Favorite Poem

ONE of the great troubles of this hurrying age is that we do not seem to have time any more for the things of life that really matter, among the greatest of which is friendship. The poem called "The Friend", by Charles Hanson Towne, which we give below, first came to my attention a year or so ago posted in a prominent place in an office of a friend at Albany. It has remained in my memory ever since.

Then today Miss Esther Foster of Mount Upton, New York, sent in a copy of the poem, stating that it is one of her favorites. I certainly think that her judgment is good.

May I remind you again that every Thursday at noon there is broadcast over WGY at Schenectady selections from famous poems and poets called "Visits with the Poets of the Farm and Home". Listen in, and send us your favorite.—E. R. EASTMAN.

The Friend

*Around the corner I have a friend,
In this great city that has no end;
Yet days go by and weeks rush on,
And before I know it a year is gone,
And I never see my old friend's face;
For life is a swift and terrible race.
He knows I like him just as well
As in the days when I rang his bell
And he rang mine. We were younger then;
And now we are busy, tired men—
Tired with playing a foolish game;
Tired with trying to make a name.
"Tomorrow," I say, "I will call on Jim,
Just to show that I'm thinking of him."
But tomorrow comes—and tomorrow goes;
And the distance between us grows and grows.
Around the corner;—yet miles away—
"Here's a telegram, sir!"—"Jim died today!"
And that's what we get—and deserve in the end—
Around the corner, a vanished friend.*

CENTAUR TRACTOR

Plows... harrows... plants... cultivates... mows... provides belt power. On truck farms, in orchards, groves or vineyards the Centaur will do all of these jobs and save time and money. If you run a large general farm, use it for cultivating row crops. Handles a cultivator with ease. Operating cost is very low. Write for catalog on the Centaur and its full line of equipment.

50,000 Farmers Have Chosen PAPEC

FIFTY thousand farmers swear by their Papec Ensilage Cutters. Last fall 182 Papec owners took the trouble to write us how much they liked their Papecs. The features that were most often mentioned were:

Self-feed that's really automatic
low speed and easy running
does not clog
six fans
adjustable lower casing
easy to set up
knives are so easy to take off, sharpen and put back.
If you fill silo, our FREE Cutter Catalog will interest you. It gives filling costs—explains new improvements—discusses filling with electric power.

H. T. OLSEN, 13 PARK ROW, NEW YORK

A.A.'s Western New York Farm and Home Talk

All Crops Suffer from Lack of Rain

IN common with others we were

By M. C. BURRITT

glad to get home from the Virginia trip. At home we found so much work that it almost, but not quite, made us wish we hadn't gone. The busy interest-

M. C. Burritt

ing time during the 1500 mile journey made us forget temporarily what we left behind. A quick trip around the farm soon reminded us, however, that oat and barley harvest was on, that alfalfa second cutting was ready, and that Duchess apples must soon be picked. These and numerous small jobs together with a family picnic gave us a strenuous week.

The drouth is with us again. The temporary relief afforded by the good rain in late July has faded. Only very light showers have fallen since then and the ground is very dry. Wells are beginning to give out and cisterns to go dry. Spring grain is practically a failure. I have never seen it shorter or poorer. Yields of wheat are running 10 to 12 bushels per acre with the high mark so far at 20 bushels. Second cutting of alfalfa is short and the yield will be light. All crops are suffering for rain, but early plowing and thorough cultivation will save many crops of beans, cabbage, and potatoes although with reduced yields. Where these crops were planted early and given good care the stands are excellent and the price outlook good.

Good Price for Early Cabbage

Some early cabbage is being harvested and the price is very good, probably due in part to the dry condition which is cutting down yields. The first cars of early cabbage were loaded out at forty dollars per ton and the price still holds at thirty to thirty-five dollars. Many of the stands of cabbage are poor and backward and cannot produce good crops. Unless the drouth is broken soon they will not amount to anything. It must be remembered that there is a much closer correlation between rainfall and yield than there is between acreage and yield, however, August and September are the critical months and will determine the crop. With rain there is enough acreage with good stands to make a good crop. Without it the crop will be a small one again.

Both beans and potatoes look very well throughout Western New York. The stands and general appearance are excellent, though both crops are beginning to show the effects of dry weather. Beans are not podding and filling as well as they might with more moisture. Potatoes certainly cannot set a full crop without more rain. By the time this is read there may be plenty of rain. The price outlook for both these crops is good and farmers who are able to bring their crops through in good condition are certain to make some money.

Flood of Immature Apples Depresses Market Prices

The Duchess apple crop is now being harvested. As usual many were picked too green and rushed on the early market because the price was good. Now that the main crop is ready and moving the price is off nearly 50 per cent. But the early picked fruit was not fit for consumption and must have hurt the market. Why will a few of us continue to injure our own business? The crop of early apples in the country as a whole is not large and the price should be much better than it is. Starting out at \$1.50 a bushel the rush, to

market the fruit has depressed prices below one dollar per bushel. Local markets have been flooded with fruit of poor quality and local prices are low. Our market facilities and control of quality and distribution are very inadequate, to say the least.

Supplementing my summary of last week, and after thinking things over for a week, two or three things stand out in my mind by way of comparison with Virginia. A day or two after I came home I had to drive about twenty miles through a fruit section on business and with Virginia orchards fresh in mind I could not help but make comparisons.

1. Most of our trees are too high headed, they show lack of vigor and are off color. They lack the total bearing surface, especially near the ground, and hence the capacity to produce good crops. This is not true of all orchards but of most of them.

2. After studying the spraying of Virginia most of us concluded that we do not apply enough material thoroughly enough. Our coverage is not what it should be.

3. Our outlets to market are becoming more and more restricted. There are less buyers in Western New York than in many years. Why? Is it not partly because it is easier to buy good quality barreled apples in quantity in the Virginias than it is in Western New York? What is the answer for us?

I would be very glad to have letters from any growers who took the trip and to pass on their impressions and conclusions to others. Let's make the most of what we have learned.—Hilton, N. Y., August 18, 1929.

Oats, Peas and Vetch for Silage

IN a recent issue of AMERICAN AGRICULTURIST you commented on the increased acreage of oats, peas and other crops for green feeding; suggesting the possibility of running such combinations into the silo and asking for readers' experiences in producing ensilage for early fall feeding.

Several years ago I sold a lot of oats, peas and vetch which were sown at the rate of two bushels of oats, one bushel of peas and ten pounds of vetch per acre. This combination gave a very heavy tonnage of excellent feed and besides feeding green many customers cut the surplus into the silo; feeding it during the fall then cutting corn on top of the remaining ensilage. This proved a most satisfactory crop, except for the fact that it matured during the busiest part of haying and many farmers found it difficult to get out the silo filling equipment and give attention to the crop in a particularly busy season. When grass seed is sown with this crop the vetch makes a fine growth with clover the following year.—F.E.S., New York.

New Nozzle Developed to Secure Complete Coverage

COMPLETE and even coverage are two of the important points to keep in mind when spraying trees for insects or diseases. If portions of the tree are skipped they are in more danger of infestation or infection than before because of the protection given the rest of the tree. Even application is advisable; first, because large amounts of spray on local areas may cause leaf burn, leaf dwarfing, fruit russetting, and poorer development of fruit color, and second, for the sake of economy, as drenching the tree is as wasteful of spray material as missing the tree altogether.

To insure complete and even cover-

age the Virginia Experiment Station has developed the Virginia Nozzle and rod having the advantages of the powerful spray gun for distance or height, and of the ordinary rod which sprays evenly but which may not have sufficient carrying capacity.

The Virginia spray rod is adjustable in length, either to 4 or 6 feet, and is equipped with a wooden grip which enables the operator to hold it firmly without becoming tired. The nozzles are made in a cluster of three or four so that the cones of spray overlap considerably. They look much like the old nozzle except that they are a little smaller. Inside they have a distributor disk with six openings instead of two openings as the old type distributor disk. The cone of spray from the Virginia nozzle is long, narrow and fine. It will carry 12 to 15 feet and will spray a 25 foot tree with ease. Users of the new nozzle say that a painter could not do an even job of applying the spray.

Connecticut's Agricultural Policy

(Continued from Page 2)

insufficient and the spread of the available information is inadequate. Connecticut's vegetable industry, according to the report, lacks standardization of grades, varieties, packages and brands and particularly lacks properly organized and regulated public markets. The vegetable men recommended a strong committee of vegetable growers to make specific needs of the growers better known to the state and government authorities.

A state policy looking forward toward the establishment of uniformity in the regulation and administration of city markets was urged by the fruit committee of the policy conference. The committee recommended the perfection of the present organization of farmer representatives in the State Legislature for the protection of agricultural interests.

Enforce Grading Laws

An extension of field service to growers and a checking and revision of the present economic information service on fruit crops, more rigid enforcement of present grading laws, a study of cold storage facilities and both service and research in solving the problems of adequate pollination, are among the recommendations of the fruit experts. The delegates urged the distribution of parasites for control of the oriental peach moth and continued work on discovery and inspection of disease resistant stocks.

Potato growers felt that the determination of the soil types most suitable for potato production, and the effect of soil on type and quality of tubers, were among their needs for the tuber industry. Research work in relation to seed and fertilization was urged in addition to a study of the costs of production and economic advantages and disadvantages of Connecticut producers compared with those of other regions. Better information regarding acreage and production was recommended. The committee expressed their belief that preferences for Connecticut potatoes can be maintained by keeping local grades somewhat above the grades of shipped-in tubers.

Dr. Walter C. Wood of New Canaan, Harold Rogers of Southington and S. McLean Buckingham, state commissioner of agriculture were appointed a continuing committee with the power to add to their number to carry forward the program that was initiated during the conference. This committee was authorized by the conference delegates to assemble any of the committee of the conference for further action and to bring into existence a committee to study the problem of taxation. Commissioner Buckingham indicated a desire to use the mid-winter agricultural meeting for the development of plans for increasing the net income of the Connecticut farmer, along the various lines indicated by the various committee recommendations of the conference for a state agricultural policy.

Those Inland May Feast on Shore Dainties

(Continued from Page 3)

miles without much variation in the temperature of their load. No ice is used in these cars. In a test run made by one of these cars from Groton, Conn. to Fort Worth, Texas, with a load of fish fillets, the temperature inside the car never exceeded 15 degrees Fahrenheit. The temperature of the car can be controlled according to the needs of the load it carries. Since cold is absolutely necessary in keeping food of good quality, this new type of refrigerating car is very promising, not only for fish but for other perishable foods, berries, melons, etc. It is claimed that this new way of distribution makes it possible for even the chain grocery stores to handle frozen fish by having mechanical refrigerators to receive the already chilled fish. The Central West is receiving regular shipments of frosted fish from the East, one wholesale meat dealer alone selling 2700 pounds each week and with a constantly growing demand.

Forty Degrees Below Zero

Still another great fish company after cleaning the fish and cutting it into fillets wraps it in parchment or cellophane, packs into corrugated boxes and freezes it at about 40 degrees below zero. If there is a carload of boxes to be shipped, a refrigerator car is used: individual boxes go by usual methods of transportation without extra refrigeration other than the cold of the enclosed product. Corrugated cardboard because of the spaces of insulating dead air enclosed is used for outside containers. In these are packed the smaller cartons, varying from one pound size up to 10 pounds. It was found that a 50-pound container had risen to 50 degrees inside temperature after seven days when the average outside temperature was 65 degrees Fahrenheit. The fish was still fresh.

And now, conservation laws being what they are which makes it hard to do private fishing all for one's self, it looks as if a new era had dawned for those who like fish for its own sake. If we feel we must justify the expense of buying the choice lovely fillets as sent out by the large reliable companies, we can remind ourselves that the deep sea fish is rich in iodine which we all need in moderate quantities. For the other very good reason that a varied menu appeals to the palate as well as being good for the health, we say that it looks as if practically everybody is due to enjoy these deep-sea blessings, as long as he has the desire and the wherewithal to satisfy the desire. And they tell us that the end of the story of refrigerated foods it not yet!

Health Is a Most Precious Asset

(Continued from Page 3)

Little units should be provided with three or more hospital beds, a supply station, a treatment room and rooms for the use of the supervising matron and the nurse. Such a unit should be under the medical supervision of some neighboring doctor who may be induced to visit the place at stated intervals.

With even this much community service and equipment Mrs. Jones in the eighth month of pregnancy and a blood pressure of 200 need not contribute to the already too high maternity mortality and Farmer Smith need not die of tetanus resulting from untreated nail puncture of the foot; and the community could be spared the loss and suffering entailed as the result of a scarlet fever epidemic through failure to recognize the nature of Johnnie's sore throat. The factor of primary importance in all rural health work is, of course, the family physician, but where he is no longer available, the next best is this type of specially trained nurse.

In more favored communities, with a well-to-do group of families the Co-operative Health League offers a fairly good solution. The League depends for its success on the principle of co-operation, popular with the grange and

other farmers' organizations. A group of one hundred or more families with a simple organization directed by a board of trustees and with a paid secretary and treasurer, can undertake to pay a physician a certain sum per family per year. In addition to this the town Board can appropriate \$500.00 to \$5000 per year. The plan is feasible, workable, and easily understood, and while possessing some objectionable features can be made of great value to the community able to help itself. It introduces a comparatively new element into rural health work, viz: health insurance of the right kind and in the contract with the physician, should be the important item of the annual health examination. The principle of co-operation is certainly better than that of paternalism."

From another correspondent we have a different suggestion as to how rural people could be assured of proper fa-

PUT SOCONY TO WORK

AS A FARM HAND

SOCONY is right at home on the farm. For fifty years, Socony products have been helping the farmer make a better profit on his produce. Today Socony plays a more important part in making a successful farm than ever before. Among the products we make especially for farm work are:

Ruddy Harvester Oil
Eureka Harness Oil
Standard Hand Separator Oil
Mica Axle Grease

Socony Turex Oil
(For Diesel and Oil Engines)
Socony Disinfectant
Socony Household Oil

Socony Gasoline & Special Gasoline
Socony Parabase Motor Oil
Socony 990-A Motor Oil for
Model A Fords

If you are not already acquainted with Socony products for farm work, put them to work as farm hands today.

In addition to this the town Board can appropriate \$500.00 to \$5000 per year. The plan is feasible, workable, and easily understood, and while possessing some objectionable features can be made of great value to the community able to help itself. It introduces a comparatively new element into rural health work, viz: health insurance of the right kind and in the contract with the physician, should be the important item of the annual health examination. The principle of co-operation is certainly better than that of paternalism."

Frank H. Lacy of Poughkeepsie writes: "I would suggest legislation permitting the organization of hospital districts, each district possibly large enough to include four or five average townships. I would erect a hospital at a central point in each district suitable to the needs of the district. I would organize a suitable medical and dental staff. I would make the expense in part a local community tax item but with very liberal state aid. And I would foster a sentiment to the effect that it was just as respectable to make use of the public medical facilities as it is to make use of the public schools. Possibly exceptions might be made in case of those abundantly well able to pay, or those requiring expensive dental work. Not all people make use of the public schools. But I am thinking mostly of the problem of bearing and rearing children.

"One thinks of the reaction of the medical and dental profession to such a plan. The answer is that such a policy would be permissive. It would be adopted at first only by communities which do not have the proper facilities at present. It would furnish employment at a fair salary for a greater number of practitioners than we now have, as more medical and dental work can be done. No one complains that the teaching profession has suffered through putting education on a public basis. The policy has made the profession."

Legislation is usually slow and follows much arousing of popular sentiment. Perhaps the solution lies in having a local organization first and then taking advantage of state legislation when it comes. At any rate, the community which gets together on the matter will be the one which gets results.

Reviewing the Latest Eastern Markets

Milk Prices

The following are the August prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
Evap. Cond. Milk Powder		
Hard Cheese	2.25	1.95
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class I League price for July 1928 was \$2.90 for 3.5% milk and Sheffield's \$2.70 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Steadies After Slump

CREAMERY	Aug. 23, 1929	Aug. 16, 1929	Last Year
SALTED			
Higher than extra	43 1/2-44	44 -44 1/2	48 -48 1/2
Extra (92sc)	43 -	43 1/2-	47 1/2-
U-91 score	38 1/2-42 1/2	39 -43	43 1/2-47
Lower G'ds	37 1/2-38	38 -38 1/2	41 -43

We have had a buyer's market since our last report. Heavy receipts, close buying and the loss of 1/2c at Chicago, combined to the detriment of the butter market, with the consequent loss of strength along with the loss in price. At the decline the market recovered some strength. The recovery of a half cent at Chicago had some influence. Stocks seemed to move more freely and several houses reported a better clearance as the week came to a close.

The demand seems to be improving. Jobbers and chain store operators show a willingness to carry rather full stocks. Undoubtedly they feel that the present rates are safe. Furthermore, there is some buying in anticipation of the improved demand that is sure to result from the return of vacationists after Labor Day. School will soon be starting and the children will have to be on hand so that we will once more see improved movement into the distributing channels. In spite of this better outlook however, the dealers are free sellers and do not hesitate to move butter where there is any margin over cost. Our heavy cold storage holdings are no secret. We have got to

move a lot of butter at a reasonable price to avoid serious consequences.

Fresh Cheese Improves

STATE FLATS	Aug. 23, 1929	Aug. 16, 1929	Last Year
Fresh Fancy	23 -25	23 -24 1/2	25 1/2-26 1/2
Fresh Av'ge			23 -25
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	
Held Av'ge			

The cheese market has continued in the same satisfactory manner that we reported last week. The price on specials has advanced to as high as 25c, the demand for fine quality fresh cheese clearing the offerings fairly well. There is a scarcity of fresh State flats, while Wisconsin Daisies are in ample supply. We look for the market to hold fairly steady for a while, at least as long as supplies keep within reason.

Fancy Nearby White Eggs Scarce and Higher

NEARBY WHITE	Aug. 23, 1929	Aug. 16, 1929	Last Year

Hennery	45 -51	42 -48	42-46
Gathered	35 1/2-44	34 1/2-41	32-41

The egg market has taken another jump. As is most always the case, the fancier qualities have taken the lion's share of the advance. Very few fancy eggs are coming from the Pacific Coast and with extremely short supplies from nearby points (we are talking about fancy eggs now) prices have gone skyrocketing. Mediums, nearby are firm. There appear to be plenty of eggs grading average extra and extra first. They are not good enough to satisfy the most critical buyers and yet they are a little too high in price to attract the buyer of medium grade eggs, such as firsts. That is why there is little sluggishness on those lines. If the eggs in these classes could have been graded a little more closely, they would have been worth from five to ten cents more a dozen depending on the grade.

Live Poultry Market Steady

FOWLS	Aug. 23, 1929	Aug. 16, 1929	Last Year
Colored	29-31	28-30	30-33

DUCKS, Nearby	22-26	22-23	23-26
GESE			

The entire live poultry market is steady. Very few colored fowls are arriving by express, and Leghorns are selling well. Express broilers are holding firm, in fact, Leghorns are gaining. Very little stock is selling below the outside quotations.

Rabbits are scarce and higher, bringing from twenty-five to twenty-eight cents a pound.

Fruits and Vegetables

Peaches, plums and prunes have commenced to arrive in limited volume from the Hudson Valley this week. The demand was generally slow for these fruits doubtless due to the small size. Early variety blue grapes were in more plentiful supply and lower in price with the outlet very restricted. The price trend on Bartlett and Clapps Favorite pears of large size and fancy quality was tending upward toward the latter part of the week. Little activity prevailed on the market for apples except on strictly fancy large fruit. Supplies are gradually increasing. Crab apples were neglected.

APPLES—Western New York Sections: barrels, Duchess U. S. No. 1 2 1/2 inch \$3.00-4.00; bushels: U. S. No. 1 2 1/2 inch \$1.50-1.75; unclassified 2 1/2 inch \$1.25-1.50, 2 1/4 inch \$1.00-1.25. Hudson Valley: per bushel basket, U. S. Grade No. 1 2 1/2 inch and upward, Alexander \$1.75-2.50; Maiden Blush \$1.25-2.00; Wolf River \$1.75-2.50; Wealthy U. S. No. 1 2 1/2 inch \$1.50-2.00. Various varieties, U. S. No. 1 pack 2 1/4 inch \$1.00-1.50; unclassified, various varieties and sizes 75c-\$1.25.

CRAB APPLES—Hudson Valley: various early varieties, per bushel basket \$1.50-2.50; per 12 quart basket 50c-\$1.00.

GRAPES—Hudson Valley: per gift crate (eight baskets) early blue variety \$1.25; Delaware \$1.50-1.75; Niagara \$1.25-1.50; climax baskets, 12 quarts, wide

range pack and quality, early blue varieties 50-75c.

PEACHES—Hudson Valley: various varieties, per 14 and 16 quart basket, wide range size, quality and pack 25-75c; per carrier of six four-quart baskets 75c-\$1.50. New Jersey, per carrier, six four-quart baskets, Elbertas 50c-\$1.75; Georgia Belle 50c-\$1.25; Hale \$1.50-2.50.

PEARS: Hudson Valley: Bartlett, per bushel basket, fancy pack \$2.00-2.50, few \$2.75-3.00, poorer \$1.50-1.75; No. 2's 75c-\$1.50; Clapps Favorite, per bushel basket, fancy pack \$2.00-2.75, poorer \$1.50-1.75; No. 2's 75c-\$1.00; per barrel, fancy pack \$5.50-7.50; No. 2's \$2.50-4.50. Bushel boxes: Clapps \$2.00-2.75.

PRUNES—Hudson Valley: per 12-quart climax basket, various varieties \$1.25-1.50.

PLUMS—Hudson Valley: Damson, per 12 quart climax basket, mostly \$1.25; per four quart basket 35-50c.

String beans, particularly the wax variety, were in generous supply throughout the week from upstate New York. Prices ranged widely owing to the great variation in the condition and quality. Cabbage declined as receipts increased. Carrots closed dull with the outlet very limited. Culiflower sold quite well, particularly on the fancy large and values averaged higher at the close of the week. White purple top turnips held steady. Little activity prevailed on celery and values slumped. The demand was very slow. Cucumbers, dills and pickles, when fancy met a fair sale at small and unimportant price changes. Lettuce steadily declined throughout the week. Supplies were in excess of trade requirements. Squash ruled dull. Onions of the red and yellow varieties of fancy quality held about steady but white onions continued dull and weak. Tomatoes were increasing in volume from the Hudson Valley and the Western part of the State. Attractive quality, ripe stock met a ready sale at sustained prices but green closed lower.

Potato markets closed considerably higher around the middle of the month as the carlot movement again decreased to about 500 cars per day. Shipping-point prices of best sacked Cobblers in New Jersey advanced to \$3.35 per 100 pounds. City dealers reported New Jersey arrivals jobbing generally at \$3.15-\$3.85, and Long Island stock advanced in New York City to \$3.35-\$3.50. Baltimore quoted Pennsylvania and Maryland Round Whites at \$2.90-\$3.

Plantings of Danish-type or winter cabbage in seven late States are estimated at 33,560 acres, or about 3,000 more than in 1928. This acreage would be about 11% smaller than the very heavy plantings of 1927. Sharpest gains over last year appear in Wisconsin, New York, Minnesota and Colorado. Production of domestic-type cabbage in the late States is forecast at 306,200 tons, as against 237,600 last season. New York may have 108,000 tons because of the much heavier yield per acre in that State.

CAULIFLOWER—Catskill Mountain Area: per crate, No. 1's \$2.50-3.50, few strictly fancy \$3.75-4.00; No. 2's \$1.25-2.00, few lots \$2.25. Colorado, per crate \$1.25-2.25.

CABBAGE—Western New York: white domestic, per sack of about 90 pounds, store sales mostly \$2.50-2.75; pier and yard sales, \$2.25-2.40. Virginia white, per crate of about 100 pounds, mostly \$3.00-3.25.

CARROTS—Western New York Sections, Orange & Oswego Counties: per bushel hamper, cut stock, store sales, unwashed \$1.15-1.25; washed \$1.25-1.50. Bunched carrots, per crate of about 48-60 bunches.

CELERY—Orange County: per bunch of 12 stalks 15-17c, depending upon size and quality. Stock in the rough, wide range pack, size, quality and condition, per two thirds crate \$1.50-2.25, some poor as low as \$1.00; half crate \$1.00-1.75, mostly \$1.25-1.50, some strictly fancy \$2.00; quarter crate 75c-\$1.25; High Ball crates 75c-\$1.50. Oswego County and Western New York Sections: stock in the rough, per two thirds crate, \$1.75-2.25.

CUCUMBERS—Western New York and Oswego County: per bushel basket, wide range quality and pack No. 1's \$1.75-2.75, mostly \$2.00-2.50; No. 2's 75c-\$1.50; dills \$2.25-3.25, mostly best \$3.00; pickles \$3.00-3.50. Albany County: per bushel basket, cucumbers \$2.50-2.75; per large barrel, dills and pickles \$13.00-15.00.

LETTUCE—Big Boston, per crate of 24 heads, all State sections 25-75c, mostly 50-60c, few lots strictly fancy slightly higher.

ONIONS—Orange County: jobbing store sales, per 50 pound bag, white large \$1.25-1.50; broilers \$1.00-1.75; picklers \$2.00-3.00; sacks of 100 pounds, yellows \$1.75-2.50, mostly \$2.00-2.35; red \$2.00-2.50, depending upon size and quality.

SQUASH—Oswego County: per bushel

basket, yellow crooked neck 50-75c; white 50-75c.

STRING BEANS—Western and Central New York Sections: per bushel basket, wide range in quality and pack, various green varieties, flat \$1.00-2.00; round \$1.25-2.25; red cranberry \$2.00-3.00; wax beans 25c-\$2.00, some worthless and dumped.

TOMATOES—Hudson Valley: various varieties, per carrier of six four-quart basket, fancy pack 144 tomatoes \$2.00-3.25, best mostly \$2.50-3.00, choice pack 180 tomatoes \$1.00-1.75, mostly \$1.25-1.50; per 12-quart climax basket 50c-\$1.15. Western New York: per carrier of six four quart baskets, fancy pack 144 tomatoes \$1.50-2.00; choice pack 180 tomatoes \$1.25-1.50; per 12 quart climax basket, poor stock 25c. At auction, per carrier, fancy pack 120-144 tomatoes, \$1.95; choice pack, 180 tomatoes \$1.55. Maryland: per carrier of six four-quart baskets, fancy pack \$1.00-1.75; choice pack 75c-\$1.25.

TURNIPS—(White purple top) Western New York Sections & Oswego County: per bushel basket, cut stock, best \$2.00-2.50, poorer \$1.00-1.50.

34% O. P. Linseed Meal	54.00	56.00	50.00

The above quotations, taken from the weekly feed letter of the N. Y. S. Dept. of Agr. and Markets are for straight carlots, f.o.b. Buffalo. Prices on mixed cars and less than carlots are higher. Consult your local freight agent for freight rates to your station.

Cash hard winter wheat prices advanced in mid-August. The soft winter wheat market also developed a firmer tone, and with the lighter receipts in good demand. Cash spring wheat markets were firm to strong. Corn and oats were firmer but barley declined with the heavy offerings meeting dull inquiry.

Fishkill Farms

Offer two
Yearling Bulls
grandsons of
Dutchland Colantha
Sir Inka

Fishkill Colantha Pontiac—His dam Fishkill Pontiac De-Kol Inka made a record of over 20 lbs. butter in 7 days as a 2 year old and 493.72 lbs. butter and 11,012.20 lbs. milk in 365 days at the age of 2 years, 11 months and 15 days.

Fishkill Maid Mengerveld—A son of Dutchland Inka Colantha Maid whose sire has a fine list of daughters including 18 over 30 lbs. and 2 over 1,000 lbs. One of her daughters, Fishkill Inka Lady DeKol made a 7 day record of 472 lbs. milk and 22.19 lbs. butter at 2 yrs. 11 mos. In 304 days she made a record of 11,741.8 lbs. milk and 550.25 lbs. butter at same age. This was the highest 2 year old fat record in America in 1927 and 1928.

Farm News from New York

Up-State New York Potato Conditions in Mid-August

I HAVE just returned from trips of over 500 miles in Central and Western New York and Northern Pennsylvania, including the Blue Tag certified seed potato tour in Western New York. Have talked with hundreds of growers from all over New York and Northern Pennsylvania. Conditions are the most favorable in a belt across New York from Binghamton and Elmira on the south to the eastern end of Lake Ontario. Rainfall here for the last seven weeks has been ample in most cases to make vines ranging from normal to very large size and nearly always of dark and healthy color. Insect damage has been small and tip-burn much less than in average season. No late blight. Planting dates may average a little later than normal and the last planted fields show vines rather small.

The prospect for the crop in this belt is for a heavier than average crop if rainfall is sufficient after this date and dates of killing frosts are normal. The eastern end of the state is mainly a dairy country that grows much less potatoes than it consumes, and here, I understand, drouth is often very severe, until by going further southeast the very severe drouth conditions of Long Island and New Jersey are reached.

Dry Conditions Reported from All Parts

Traveling west from this belt north and south across Central New York I see and hear of a gradually increasing severity of drouth conditions. Steuben County vines, particularly in the fields of the certified seed growers, were smaller than in fields further east, and I heard much of late planting and of dry soils. Color of vines was nearly always very good and tip-burn slight. Towards the western end of the state drouth appeared to be more severe. A considerable number of fields showed heavy tip-burn, particularly on gravelly soils. Several good growers called the drouth one of the worst in their memories.

Forecast of size of the crop is difficult. The drouth and late planted fields will make the dates of killing frost more important than in most years. Half a dozen well distributed rains of one inch each would give a crop heavier than average, with normal frost dates.

Drouth in the west has cut the wheat crop of the three great prairie provinces of Canada from over 500,000,000 bushels in 1928 to only half that much in 1929, and the same drouth is threatening to badly damage the main crop of potatoes in our middle western states. Here in the east drouth has already badly cut the Long Island and New Jersey crops. Will the 1929 potato crop be as short as in the drouth seasons of 1901, 1911 and 1916, when the short crops brought high prices? Or will the

dry summer be followed by plenty of rains to revive the crop and produce heavy yields, as has happened several times in the past?

The reduced acreage this year caused most of the drop in the estimate from 464,483,000 bushels for the 1928 crop to the present August 1st estimate of 373,000,000 bushels. It is certain that the reduced acreage alone must cause higher prices than those of the last season. The rainfall and the dates of killing frosts for the next sixty days will make or break potato prices for fall, winter and spring.—DANIEL DEAN.

The New Automobile Liability Law

THE last session of the New York State Legislature passed a new financial automobile responsibility law which will become effective September 1st. Many inquiries are being received as to how this law works and to whom it applies.

Some insurance agents, in order to get more business, are giving the impression that every automobile owner is included in the jurisdiction of this law. This is not so. The Bureau of Motor Vehicles emphasizes the fact that no person shall be subject to the provisions of the new law unless he has failed to pay a judgment for damages in an automobile accident or has been convicted of any of the following:

1. Speeding or reckless driving, if injury to person or damage to property has resulted; or
2. Driving a motor vehicle without a license; or
3. Driving a motor vehicle while intoxicated; or
4. Leaving the scene of an accident without reporting; or
5. An offense in any other state which would be a violation of any of the above if committed in this state.

Farm Board to Broadcast

ON Saturday, August 31st, from 1:30 to 2:15 eastern standard time, the National Broadcasting Associated Stations will broadcast the first Farm Board program. Speakers will include Chairman Legge, Carl Williams of Oklahoma, C. C. Teague of California, and Charles S. Wilson of New York.

The Board will discuss the work already accomplished and future plans.

Holstein Breeders Celebrate At Peterboro

NEW York Holstein breeders and their families will remember pleasantly for many a day the fine gathering and picnic at Peterboro on Satur-

day, August 17th. The State Troopers reported nearly a thousand automobiles, averaging from four to five persons to the car, in attendance at this picnic to celebrate the first production record made and registered in the United States.

Mr. Gerritt Miller, on whose farm the record was made, acted as host, and donated one thousand dollars to maintain perpetually the monument to the first record cow. Among the speakers were Frank O. Lowden, President Holstein-Friesian Association of America, Berne A. Pyrke, Commissioner of Agriculture and Markets of New York State, Jared Van Wagenen, Jr., writer for AMERICAN AGRICULTURIST, A. A. Hartshorn, Past President, Holstein-Friesian Association of America, Gerritt S. Miller, America's oldest Holstein breeder, and Prof. H. H. Wing, Chairman of the afternoon.

The weather was ideal for the meeting and the pleasure of everybody was materially increased by the good milk and ice cream furnished by the Dairy-men's League Cooperative Association.

New York County Notes

Madison County—DeRuyter, from which these notes are written, is in the Southwest corner of Madison County at the four corners of Madison, Cortland, Onondaga and Chenango Counties. This is on the direct route from New York to Syracuse and from Albany to Buffalo. The site of an airport has been chosen and dedicated and an aeroplane factory may locate here. State road near this place is being improved. All this is of interest to our farmers, making life pleasanter and property more valuable. Madison County has had ideal weather for comfort this past month. Haying is finished in many places. Others are finishing.—Mrs. C.A.P.

Saratoga County—Very cold nights and hot days. The weather is wonderful for haying as there has been no rain lately. School houses are being repaired and improved. Gansevoort Grange hall is being enlarged. Farmers busy getting silos and buildings in condition for filling. Cultivating and hoeing are completed for the sea-

son. Broilers and fowls in good demand. Wild blackberries are not as plentiful as some years. Saratoga Springs is a splendid market during the racing season.—Mrs. L.W.P.

Rensselaer County—The weather is dry and the crops are drying. Gardens and cucumbers are showing white and yellow leaves. Corn is showing leaves curling from the sun. Even rain will not restore life to some crops. Haying is moving rapidly. All dry and in good shape.—Mrs. F.

Genesee County—Miss Elizabeth Coon, Home Bureau Agent, Charles Bowman, Farm Bureau Agent, Reuben Shapley, Assistant Farm Bureau Mgr., and J. D. Walker, Junior Extension Agent attended a picnic of Western New York Agents at Long Point, Conesus Lake. Farmers who are threshing their wheat in the lot find the weevil and rust have damaged it considerably. Some are much disappointed with the yield. The stand seemed so even and gave promise of a fine yield.—Mrs. R.E.G.

Clinton County—We have had a number of hard rains and thunder storms in different parts of the county recently. Hay will be a big crop. More beans have been planted than last year. Oats and barley were sown later than usual but are looking fairly well. Corn grew a lot during the hot spell. Tourists and campers are beginning to come.—R.J.M.

Niagara County—Reports from leading fruit growers in the county indicate good crops of apples, peaches and grapes. Pears, plums and quinces will be light. A bumper crop of cherries is now being harvested. Sour cherries bring 7c a pound at the canning factories. Farmers are in the midst of haying and wheat will soon be ready. Eggs are 40c per dozen along the roadside. The Farm Bureau has appointed an Agricultural Council to make a survey of farm conditions in the county as a basis for readjustment and aid in solving some of the problems now confronting farmers. The State College and representative city and county organizations will assist. Thomas Macks is chairman and L. A. Muckle, county Farm Bureau agent is secretary. Laura Ray, Home Bureau agent in the county for the last three years, has resigned to become the bride of George Hervey of the Geneva State Experiment Station. Miss Dora Wadsworth of Wayne County will succeed her.—Mrs. W.U.S.P.

Notes About the Fair

Florida Products to be Exhibited at Eastern Fairs

THE Atlantic Coast Line Railroad is preparing an exhibit of products from the State of Florida, which will be shown at eastern fairs during August, September and October. The exhibit contains samples of almost every crop grown in Florida, as well as products of forests, factories and mines. The schedule of fairs at which this exhibit may be seen is as follows:

Washington County Fair, Hudson Falls, N. Y., August 20-24.

Dutchess County Fair, Rhinebeck, N. Y., August 27-31.

Rochester Exhibition, Rochester, N. Y., September 2-7.

Reading Fair, Reading, Pa., September 10-14.

Great Allentown Fair, Allentown, Pa., September 17-21.

Doylestown Fair, Doylestown, Pa., September 24-28.

Trenton Inter-State Fair, Trenton, N. J., September 30-October 5.

York Fair, York, Pa., October 8-12.

The Great Frederick Fair, Frederick, Md., October 15-18.

A similar exhibit was shown by the Coast Line in the New England states last year, where it attracted a great deal of attention.

Fairs Have Good Prize List for Ayrshires

THE Ayrshire Breeders Association has just announced a prize list of over \$1600 at the Eastern States Exposition and the New York State Fair for a class of bull calves from tested dams. It is stated that this is the largest prize list ever offered for any one class of dairy cattle. Professor H. H. Kildee, of the

Iowa College of Agriculture, will judge at the Eastern States Exposition and Louis Seitz, of Waukesha, Wis., will judge at the New York State Fair.

The Empire Futurity at Syracuse has the following entries: H. O. Craner, Jamesville, N. Y. (1), I. D. Karr, Almond, N. Y. (2), Metropolitan Life Insurance Co. Sanatorium, Wilton, N. Y. (1), Sycamore Farms, Douglasville, Pa. (1), A. F. White & Son, Hornell, N. Y. (1), Hurst & Sipher (1).

* * *

Eight Counties To Exhibit

AT this year's New York State Fair, eight county Farm Bureau Associations will arrange exhibits to show the agriculture of their counties. These exhibits will be grouped together in the eastern portion of the Manufacturer's Building, which has been used for the display of farm produce, fruit and flower exhibits. The Grange, Home Bureau and Farm Bureau exhibits are also in this building. The counties that will arrange exhibits this year are: Chautauqua, Genesee, Chemung, Yates, Schuyler, Cortland, Herkimer and Schenectady.

The winning county will be the one which arranges in a most attractive manner an exhibit showing the county's agriculture with the best quality farm produce. To note the recent changes in types of agriculture since the 1925 census will be of interest to those who attend the fair.

E. C. Weatherby, superintendent of these Farm Bureau exhibits, recently stated that he expected this year's exhibits will be uniformly better than ever before arranged. The judges will be: Jared Van Wagenen, Jr., Lawyersville, farmer and staff editor of AMERICAN AGRICULTURIST; J. Roe Stevenson, Cayuga, Master Farmer; and Professor V. B. Hart, of the New York State College of Agriculture.

New Grape Grading Regulations

THE last session of the Legislature passed a great grading and standardization law, and Berne A. Pyrke, Commissioner of Agriculture and Markets, has just issued standards for the grading, classification and packing of grapes in accordance with this new law. The new regulations will be effective September 1st, and are as follows:

"U. S. Fancy Table Grapes shall consist of grapes of one variety which are well colored, mature, firmly attached to capstems, not shattered, split, crushed, dried, wet or soft; which are free from mold, decay, mildew, berry moth, russeting, hail, and from damage caused by freezing, disease, insects or other means. Not less than 75 per cent of the bunches shall be compact and the remainder shall be fairly compact. Bunches shall not be excessively small excepting that compact portions of bunches consisting of no less than five berries may be used to fill open spaces between whole bunches.

Not more than a total of 10 per cent, by weight, of the berries in any lot may be below the requirements of this grade.

"U. S. No. 1 Table Grapes shall consist of grapes of one variety which are fairly well colored, mature, firmly attached to capstems, not shattered, split, crushed,

dried, wet or soft, which are free from mold, decay, berry moth, and from damage caused by mildew, russeting, hail, freezing, disease, insects or other means. Not less than 85 per cent of the bunches shall be fairly compact."

Not more than a total of 10 per cent, by weight, of the berries in any lot may be below the requirements of this grade.

"U. S. No. 1 Juice Grapes shall consist of grapes of one variety which are fairly well colored, mature, firmly attached to capstems, not shattered, split, crushed, dried, wet or soft, which are free from mold, decay, berry moth, and from serious damage caused by mildew, russeting, hail, freezing, disease, insects or other means. Not less than 60 per cent of the bunches shall be fairly compact."

Not more than a total of 15 per cent, by weight, of the berries in any lot may be below the requirements of this grade.

"Any lot of grapes consisting of more than one variety which meets all other requirements of 'U. S. Fancy Table,' 'U. S. No. 1 Table' or 'U. S. No. 1 Juice' may be designated as 'U. S. Fancy Table Mixed,' 'U. S. No. 1 Table Mixed,' 'U. S. No. 1 Juice Mixed.'"

"Ungraded. Grapes which are not graded in conformity with the foregoing grades may be designated as 'Ungraded.'"

Saving A Priceless Commodity

Knowing How To Spend Time Is As Valuable As Knowing How To Earn Money

"HOW I would love to if I only could. But I just can't seem to find the time for such things. There is always so much to do at home." So regretted one of my neighbors when I invited her to join our Home Bureau group. It is the great American cry. And yet for centuries theologians and scientists have been trying to tell us that there is no end to time. But we housewives know better. Time is always ending. There is never enough of it. It is always giving out when we need it most.

What housewife has ever felt that

2722

Carryall utility bag No. C2722 is stamped on fine quality linen colored crash and is all made up with the exception of attaching the handle. The strips for the handle are furnished. The bag when finished is 10x13 inches in size and is most convenient for the shopping tour. Price 45c. Address Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

she was sufficiently supplied with that fleeting commodity to perform the most necessary duties—the cleaning, mending and sewing, baking and cooking, gardening, and the hundred and other routine tasks? Then think of the enticing possibilities of fancy sewing, reading, Women's Clubs, artcrafts, and other forms of recreation and outside activities. To say nothing of being able once in a great while to just sit and rock. What average housewife with a family has ever had her "fill" of these things?

There are doubtless some superwomen who have discovered the secret of wresting from each hour its full worth. Many have not. But experience with some common sense and thought will go a long way towards achieving this end.

How delightful it would be if it were possible to be master of one's work by simply saying, "I will have none of you now. When I am ready, when I feel so inclined, then I will attend to you." That surely ought to put work in its place. But it doesn't. For, suddenly, after an aimlessly spent morning, the work is piled high—the dishes are unwashed, beds unmade, no baking is done, and dinner not even thought of. Then nerves and grouching develop and we declare ourselves the most overworked group in the world.

After two experimental years which netted me little gain in results, I decided to take an inventory of my methods. I began checking up my efforts and their results, deciding what practises were of greatest value, emphasizing those and discarding the others. This inventory resulted in several resolutions which I have followed with most gratifying results.

First of all I scheduled my time, allowing a definite period for the accomplishment of each task. I began to realize how much time I had been wasting and where it had gone. Keeping a schedule in mind I soon found myself doing certain tasks always at the same time and by some study I was able to

determine the best time for these activities. Then I began to formulate a definite schedule. It was interesting to see how easily it worked itself out. Now I don't need to watch the clock closely. The particular job I am doing is a fairly accurate indication of the time. There is one period I insist on keeping twice a day. That is a short rest period, either of reading or lying down. In the morning I allow ten or fifteen minutes while my dinner is cooking, and about one half to one hour in the afternoon immediately after my work is done. It is invaluable in the saving of nerves and feelings.

My second resolution was to make mornings count. My dessert and vegetables are prepared as soon as my breakfast is over and the baby taken care of. If a pudding is needed for dinner and a cake for supper, the same batter can serve the two purposes; a fruit, chocolate or gingerbread pudding at noon with a sauce, or whipped cream, and cup cakes or gingerbread at night. My breakfast dishes wait

ing, necessitating a last minute marketing or a hastily thrown-together meal. I look at my menu, order a day in advance, and then my refrigerator checks with my plans. Food for extra busy days may be prepared the day before.

Third. I have found that a supply list is invaluable. Whenever I am low in some article it is listed and included in the day's marketing.

For my last resolution I decided to make my head save my heels. I collect articles that go upstairs at the foot of the stairs and they all go up together. One well planned cellar trip may save several.

The scheduling of my time has surprised me for it has taught me two things; that there is a good deal of time in a day if one uses it thoughtfully; and that I am much more capable than I had believed. I have more time for doing things that I had always wanted to do but "couldn't find the time for". I accomplish things more easily, feel less weary, and have more time to myself.

Of course no schedule can be followed implicitly. There is no human executive so subject to interruptions, both day and night, as is the housewife, and none of whom such versatility is required. And there is no efficient office boy to shut the door against importuning forces. Still, things run much smoother and there is a minimum of wasted time and effort if the woman has planned her hours and knows how she wishes to use them.

There is a constant race against the clock which adds a zest to household tasks. And I have made it possible to devote less time to housekeeping and more to other activities. This makes a job which might easily approach drudgery, become a pleasant occupation.—MRS. E.B.T.B., JR.

Paintings of Many Lands

EACHERS and mothers who are training children to appreciate pictures and to know interesting little stories about them and the men who

painted them will like the help of the booklet "Paintings of Many Lands and Ages" by Professor Albert W. Heckman, Westport, Conn., 50 cents a copy, published by the Art Extension Press. This collection of stories about famous paintings and painters was designed to accompany some ninety color reproductions of paintings selected by the Art Extension Society for study in elementary and high schools. The small pictures come in sets and are intended to bring in miniature form the rich colors and pleasing lines of the original pictures. Proceeding on the idea that pictures must be seen in colors to be appreciated, these small prints in colors have been made available at a reasonable rate by the Art Extension Society. The book helps by giving facts about the pictures and those who painted them.

There are two additional booklets, 25c each, which have been written by Mr. Heckman and Dorothea Strain, published by the Society, for the purpose of supplementing the larger original booklet "Paintings of Many Lands and Ages". The supplements are called "Stories of Great Paintings" Part I and Part II, and contain further stories about pictures and their painters.

A Letter to Betty

Dear Betty—I see your name in the American Agriculturist. I have not got one of your scrapbooks to paste these recipes in so will you please send one to me. I have sent my ten cents with this letter. We live on a farm. My father takes the American Agriculturist. I am 13 years old and can bake most everything and I have four sisters. Thelma is 12 years old, Pearl is nine years old, Flo is four years old and Leona 16 months. The other girls are learning to bake, so we can use the scrapbook together. Please find enclosed 10c in stamps. Thank you.—Yours truly, L.F., N.Y.

A dark floor makes the best background to set off rugs.

Molded Bodice

2902

DRESS PATTERN NO. 2902 is smartly designed with its molded bodice and full circular skirt. The lovely printed silks and chiffons are well adapted to this type of frock. Pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 2 7/8 yards of 40-inch material with 3/4 yard of 36-inch contrasting. PRICE 13c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the fall and winter fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Avenue, New York City.

upon my baking tins, and before washing my dinner dishes I prepare my supper salad or escalloped dish.

My third resolution called for planning the week's meals in advance. Of course the actual meals may not always follow the written pattern. It may seem wise to use some leftover differently or there may be none to use. But it does eliminate the sudden discovery that material for a main dish is lack-

Three Clever Little Pillows

Have you noticed that clever, conventional animals have come to a place in home decoration? Our group of three pillows presents a camel, giraffe, and elephant primly conventionalized to fit the 10-inch squares of satin. There is a quilted background on each, while the outlining of the figures may be braided, embroidered, cone-painted in plastic, or simply quilted, all equally effective.

The entire group is for use in a big chair, chaise lounge, or davenport, separately as elbow pillows, or just grouped with other pillows. Order No. M572 includes the group of three, fronts, backs, and edge boxing material of satin-radiant, a high luster silk and rayon cloth. Colors are red, gold, and green stamped with the camel, elephant, and giraffe, the group of three complete at \$1.00 postpaid. Box pillows filled with kapok for the tops described—slightly under 10 inches square, may be ordered as M573, for \$1.25 for three. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

Little Recipes for Little Cooks

Lesson Number Six

by *Betty*

*Can You Get Your
Own Breakfast, and
Would You Like to
Make a Coffee Cake?*

Dear Little Cooks:

When I think of how many, many little cooks there are now learning these recipes, then I get to wondering what you are all doing these hot, busy days on the farm. There are some little city girls who are little cooks, too, but maybe they are visiting in the country now. Part of the time I am so busy helping Daddy that I haven't time to cook at all. You see, I drive the horses on the hay rope or on the wagon when he is haying. I like to drive and the men say it helps a lot to have a driver sometimes.

Another way I help is by taking lunch out to Daddy. I thought maybe you would like to have my recipe for the coffee cake that I make to take for lunch sometimes. It's good with coffee, the men say. Of course, I drink milk for my lunch, don't you?

Betty.

Quick Coffee Cake

Have the oven real hot for this.

4 tablespoons sugar (2 spoonsful will do.)
½ cup flour, sifted before measuring.
Few grains salt.
1 teaspoon baking powder.
2 tablespoons raisins.
4 tablespoons milk.
½ egg beaten and 1 tablespoon of melted butter.

Mix the dry ingredients, which are the first five given. In another bowl beat the ½ egg and add the milk and melted butter. Add these to the mixture in the first bowl and stir well.

Then I grease a cake pan and pour in the batter. Then I mix 1 tablespoon of sugar and ¼ teaspoon of cinnamon and sprinkle it over the top. Now it is ready to put in the hot oven to bake about 15 minutes.

Mother says you will notice that this is really only a sweet muffin recipe but the raisins in it and the sugar and cinnamon on top make it seem quite different.

Use this larger recipe when you want to make one for the men's lunch.

1 cup of sugar.
2 cups flour, sifted.
4 teaspoons baking powder.
¼ teaspoon salt.
½ cup raisins.
1 or 2 eggs.
1 cup milk.
4 tablespoons melted butter.
Sprinkle with 4 tablespoons sugar.
1 teaspoon cinnamon.

Cottage Cheese

Do you have cottage cheese at your house? We do. Mother says it is such a fine food, to be had so cheaply on the farm, and that we ought to serve it lots of different ways so we won't get tired of it quickly. So I am going to tell you how I fix it up and maybe you can surprise your mother with a new way to serve it.

Mother generally cooks it herself, but if you want to do that part, too, put the thick sour milk on the back of the stove where it will warm but not become very hot, because too much heat makes the cheese tough and stringy. When the curd and whey are well separated, pour it all in a clean cheesecloth bag to drain (we use a

clean salt sack which is just the right size). We tie the bag and hang where the whey or watery part will all drain off. When it is cool enough, squeeze the bag hard to get rid of all the water. Then empty out the cheese into a clean bowl and let it get very cold.

When I want to fix my cheese for the table, I mix it smooth and add salt and cream to moisten as we like it best. It is very good just this way, but I enjoy making it into balls about the size of walnuts (hands must be extra clean for this work). I put these balls on crisp clean lettuce leaves and in the top of each ball I make a tiny hole. In this hole I put a bit of jelly of a bright, pretty color. This makes a pretty dish.

Other times I add raisins or dates to the cheese before I serve it. Nuts and dates are very good in cottage cheese. Cottage cheese balls look ever so pretty dipped in finely chopped parsley, too. Mother likes salad dressing on cheese balls and so she showed me how to put a spoonful of dressing on the cheese ball and then a one-half walnut on the dressing.

I hope you like these ways to make this good food look and taste better. Mother will be glad to know that she can depend on you to fix that part of the supper.

Making a Good Breakfast

Sometimes, when there is no school, I sleep quite late and then mother thinks I should get my own breakfast because getting late breakfasts takes lots of her time when she wants to be doing other things.

This is what I very often get for myself:

Milk Toast

To make this I first put a cup of milk to heat in a sauce pan. Then I cut a slice of bread, a rather thick one, and toast it carefully. I watch it every minute because I do not like burned or scraped toast. When I have my toast nicely

browned on both sides, I take it off and butter it well on one side.

Then I sprinkle a wee bit of salt over it and place it on a deep plate or in a soup bowl because I like quite a little milk on my toast and I want room for the milk without spilling. When the milk is steaming hot, I pour it over the toast and eat it while it is nice and warm.

If I feel very hungry, one slice isn't enough for a whole breakfast. So I either toast two slices and heat more milk or I plan to eat a dish of cereal with sugar and cream before I have my toast. We aren't allowed to eat a whole breakfast of pancakes and syrup and drink coffee. Maybe if we did, the school nurse would not have said, as she saw me come into the room to be examined, "I can tell just by the looks of that girl that she is healthy."

I like eggs and there are always plenty of fresh ones on a farm, so sometimes I poach an egg to go on top my slice of toast.

Poached Egg

To poach an egg I first take a small sauce pan and fill it with boiling water and put it where it will stay about as hot while the egg is cooking. Then I take an egg which I know is fresh and break it very carefully into a saucer. Then I slip it carefully into the hot water and let it stay until it is as hard as I like my eggs. Then I take a pancake lifter and lift it very carefully and slip it onto the slice of toast and I salt and pepper my egg. After this I pour on the hot milk.

After I can do this well mother lets me fix a whole big platter full of toast and eggs for the family supper.

Betty

Little Betty enjoys looking over her recipes after they are pasted in her scrapbook. So will you!

Award of Merit

There are to be in all 24 pages of recipes like this one. To every Little Cook who keeps a complete set and who makes all the recipes, a pretty certificate, on tinted paper, will be given as a reward. Five lessons have been printed, but they will be sent with all scrap books, so any Little Cook can start now and now miss any lessons. Even with these back lessons you can get a scrap book for 10 cents from Betty.

The Plains of Abraham—By James Oliver Curwood

He answered the shot by dropping his bow and dashing toward the mill. Odd was a leap ahead of him when they reached its broken-down door, and the dog stopped as he faced the shadows that lay within the stone walls. Jeems went on. Death might easily have met him at the threshold, but nothing moved in the vaultlike chamber he had entered, and there was no sound in it except that of his own breath and his racing heart. Odd came in and sniffed the grain-scented, musty air. Then he went to the flight of narrow steps which led to the tower room and told Jeems that what they sought was there. Jeems ran up, his hatchet raised to strike.

He must have been an unforgettable and terrifying object as he appeared above the floor into the light which forced its way through the dusty glass of three round windows over his head. There must even have been a little of the monster about him. He had left some of his garments with his mother and father, and his arms and shoulders were bare. Char and smoke and the stain of earth had disfigured him. His face appeared to be painted for slaughter and a greenish fire glittered in the eyes that were seeking for an enemy. Blood dripped to the oaken planks from his wounded arm. He was a Frankenstein ready to kill, dishevelment and fury concealing his youth, his stature made appalling by his eagerness to leap at something with the upraised hatchet.

If the hatchet had found a brain, it would have been Toinette's. She faced him as he came, holding the musket which she had fired through a slit in the wall as if she possessed faith in its power to defend her. Her pallor was heightened by the silken darkness of the long hair which streamed about her. Her eyes had in them a touch of madness. Yet she was so straight and tense, waiting for death, that she did not seem to be wholly possessed by fear or terror. Something unconquerable was with her, the soul of Tonteur himself struggling in her fragile breast to make her unafraid to die and giving to her an aspect of defiance. This courage could not hide the marks of her torture. Death had miraculously left her flesh untouched in passing, yet she stood crucified in the mill room.

Expecting a savage, she recognized Jeems. The musket fell from her hands to the floor with a dull crash, and she drew back as if retreating from one whose presence she dreaded more than that of a Mohawk, until her form pressed against the piled-up bags of grain, and she was like one at bay. The cry for vengeance which was on Jeems's lips broke in a sobbing breath when he saw her. He spoke her name, and Toinette made no response except that she drew herself more closely to the sacks. Odd's toenails clicked on the wooden floor as he went to her. This did not take her eyes from Jeems. They were twin fires flaming at him through a twilight gloom. The dog touched her hand with his warm tongue, and she snatched it away.

She seemed to grow taller against the gray dusk of the wall of grain.

"You—English—beast!"

It was not the mill wheel this time, but Toinette's voice, filled with the madness and passion which blazed from her eyes.

With a sudden movement she picked up the musket and struck at him. If it had been loaded, she would have killed him. She continued to strike, but Jeems was conscious only of the words which came from her brokenly as she spent her strength on him. He had come with the English Indians to destroy her people! He and his mother had plotted it, and they were alive while everyone who belonged to her

was dead! The barrel of the gun struck him across the eyes. It fell against his wounded arm. It bruised his body. Sobbingly, she kept repeating that she wanted to kill him, and cried out wildly for the power with which to accomplish the act as he stood before her like a man of stone. An English beast—her people's murderer—a fiend more terrible than the painted savages.

She struck until the weight of the musket exhausted her and she dropped it. Then she snatched weakly at the hatchet in Jeems's hands, and his fingers relaxed about the helve. With a cry

The thrill was gone in a moment. The red drops fascinated her, painted brightly by the sun. Jeems Bulain—out there with her dead! The boy her mother had tried to make her regard with bitterness and dislike from childhood—a man grown into an English monster! She struggled to bring back her power to hate and her desire to kill, but the effort she made was futile. She followed the crimson stains, hearing nothing but the mill wheel over her head. Emptiness was below, a loneliness wherein the sun itself seemed to

voice. She understood what his burden had been. Tears? Such trivial things could not exist in the after-heat of the holocaust that had consumed them. A stray undercurrent of wind flung back her hair in a lacy mantle of jet silk. Pride, defying grief, raised her chin a little as she obeyed Jeems. It shone in her widening eyes and in her parted lips as she looked ahead. She knew to what she was going. And when she came to the place which Jeems had prepared, she was like a white angel who had appeared to gaze for a moment or two upon the dead.

With a tool he had found, Jeems had made a grave. It was shallow and made less unbecoming with a bed of golden grass. Tonteur did not seem unhappy as he lay upon it. The top of his head was covered so Toinette could not see. She knelt and prayed, and Jeems drew back, feeling that to kneel with her, with the marks of her hatred on his face and body, would be sacrilege.

Even now, when it should have known better, the mill wheel continued to whine and scream, and suddenly it occurred to Jeems that it could not have been that way yesterday when Tonteur was alive. A devil must have come to abide at the top of the mill!

He waited, scanning the horizons that were thinning of their smoke. Death had passed and death might return over its own blackened trail. Toinette, beside her father, made him think of that. It seemed a long time before she rose to face him. She was not crying. Her eyes were blue stars in a countenance as pale as marble. The sun shone on her and gave an unearthly radiance to her hair. Her beauty held him stricken just as his own terribleness forced from her a gasp of protest when he drew off the coat borrowed from one of the dead men and spread it over Tonteur. But she did not speak. Only the mill wheel continued its virulent plaint as the loose earth fell on the baron. Toinette looked steadily toward the sky, and when Jeems was done she accompanied him back to the mill. She watched him go for his bow, where he saw that the form he had thought was Toinette was the wife of Peter the Younger.

He came back and spoke to her a second time. The lips she had broken with the musket barrel were swollen, and the brand across his forehead was turning a dark and angry colour. The cloth he had twisted about his wounded arm was red. Sickness and pain were forcing their way into his eyes.

"I must take you away," he said. "There is not time to care for the others. If they come back—"

"They will not harm you," she said.

Jeems made no answer but looked away over the Richelieu toward Champlain and Dieskau.

"And they will not harm your father or your mother or anything that belongs to the Bulains, but will reward them for their loyalty to murder and outrage. Is not that true?"

Still Jeems did not answer, but stood listening for sound to come out of the distance.

Her voice was quiet and mercilessly unmoved by the marks of the punishment which her hands had inflicted. He had received less than her own people, and it was only an accident of her weakness and want of skill that he had not suffered equally with them. She saw the sickness gathering in his face and eyes, but pity for him was as dead in her breast as her desire to live. She knew where he would take her. To his home—a place left unscathed by the killers. To his mother, the soft and pretty woman in whom her father had believed so faithfully.

(Continued on Page 14)

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain's brother Hepsibah who is a trader pays them a visit. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight. That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems. Friction between the French and English grows steadily worse and there are rumors of war and massacre. One day Jeems takes a trip to Lussan's and as he returns just at dusk he finds his home on fire.

Jeems finds his father and mother dead and scalped by Indians and later finds Tonteur Manor also burned. He fears that Toinette has also been killed.

of triumph, she raised it, but before the blow could descend she sank in a crumpled heap upon the floor. Even then her almost unconscious lips were whispering their denunciation.

He knelt beside her and supported her head in his unwounded arm. For a moment it lay against his breast. Her eyes were closed, her lips were still. And Jeems, sick from her blows, remembered his mother's God and breathed a prayer of gratitude because of her deliverance.

Then he bent and kissed the mouth that had cursed him.

CHAPTER XI

TOINETTE was alone when she awoke from the unconsciousness which had come to ease the anguish of her mind and body. It seemed to her she was coming out of sleep and that the walls which dimly met her eyes were those of her bedroom in the Manor. That a truth whose evidence lay so horribly about her could be reality and not a dream broke on her senses dully at first and then with a swift understanding. She sat up expecting to see Jeems. But he was gone. She was no longer where she had fallen at her enemy's feet. But Jeems had made a resting place for her of empty bags and must have carried her to it. She shivered when she looked at the musket and the stain of blood on the floor. She had tried to kill him. And he had gone away, leaving her alive!

As had happened to Jeems, something was burned out of her now. It had gone in the sea of darkness which had swept over her, and she rose with an unemotional calmness, as if the tower room with its dust and cobwebs and store of ripened grain had become her cloister. Passion had worn itself away. If a thought could have slain, she would still have wreaked her vengeance on Jeems, but she would not have touched the musket again that lay on the floor.

She went to the head of the stair and looked down. The son of the Englishwoman had left no sign except the drip of blood that made a trail on the steps and out of the door. Exultation possessed her as she thought how nearly she had brought to the Bulains the same shadow of death which they and their kind had brought to her.

lose its warmth.

She stood in the doorway, and all about her was the haze of smoke, soft and still in the air. In the distance, obscured by the fog which ran from the smouldering ruins, she saw a form bent grotesquely under a burden. It was a shapeless thing, distorted by the sun and the smoky spindrifts dancing before her eyes, but living because it was moving away from her. Behind it was a smaller object, and she knew the two were Jeems and his dog.

She watched until they were blotted from her vision, and minutes passed before she followed where they had gone.

Jeems must have seen her, for he reappeared with the dog like a werewolf at his heels. He had found a coat somewhere and did not look so savage, though his face was disfigured and bleeding where she had struck him with the barrel of the musket. He was breathing deeply, but his face was as dispassionate as it had been in the tower room—an Indian's face, with flesh tempered by the impassiveness which she had assaulted so bitterly. She tried to speak when he stopped before her. Accusation and a bit of ferocity remained in her soul, but they were impotent in the silence between them. His eyes meeting hers steadily from under the lurid brand of her blow, seemed less like a murderer's and held more the gaze of one who regarded her with a cold and terrible pity. He did not put out a helping hand though she felt herself swaying. He was no longer youth. He was not the boy her mother had trained her to hate. He was not even Jeems Bulain.

But his voice was the same.

"I am sorry, Toinette."

Jeems scarcely knew he spoke the words. They rang back through the years as if a ghost had come to life whose memory they had flayed out of their hearts a long time ago.

"What are you doing here?" she demanded.

She might have asked that same question in those unimportant years when he had dared to visit Tonteur Manor with his foolish gifts. Why was he here? He turned in the direction from which he had come and held out his hand, not for her to take, but as a

The Question Box

Chickens Have Swollen Heads

"Some of my chickens have swollen heads. They are smart and eat well. Is this a disease and if so, what can I do for it?"—F.S.B., New York.

SWOLLEN heads are not a disease, but are one of the common symptoms of colds. The nasal cavities or sinuses become infected and swollen. In very severe cases in mature birds the swelling sometimes will push the eye out of its socket and cause blindness if it does not kill the bird.

Colds are not common in young chicks and where found are usually limited to a few cases. The cause is usually overcrowded or poorly ventilated roosting quarters.

Another type of swollen head in young chicks is caused by a lack of enough vitamin A. In this case the whole head seems puffed out tending to close the eyes and giving the head a sleepy look. A sure proof of "nutritional rump" as this trouble is called, is to kill one of the birds and examine the kidneys. They will have a distinctly whitish mottled appearance. The roof of the mouth and the gullet may be covered with small white cancer-like spots. The remedy for this trouble is to give the chicks an abundance of tender green food or cod liver oil.—L. E. WEAVER.

Cleaning Rust from a Water Pipe

"I would like to know how to remove rust from my ¾ inch galvanized pipe. It leads from a spring some 400 feet away. It is now running about 1/4 inch stream with lots of water in the spring. Would like to remedy this without digging up as the pipe is buried 4 or 5 feet deep."—E.S., New York.

IN reply to your inquiry to the AMERICAN AGRICULTURIST as to how you can remove the rust from your 400 feet of ¾ inch galvanized pipe without digging it up, would say that this will be rather difficult and perhaps rather expensive for material.

The only way I can figure out is to drain the pipe of water, then fill it with a solution of about one part of commercial hydrochloric acid to about five of water. A ¾ inch pipe 400 feet long will hold about 12 gallons, and if one-sixth of this is hydrochloric acid, it would require about two gallons of acid for which you can get prices from your local plumber, hardware dealer, and druggist. The first two use a good deal of commercial hydrochloric (muriatic) acid for soldering and perhaps can make you a better price than the druggist. Fill the pipe with this mixture and let it stand overnight, then drain out the acid, run a wire with a cleaning brush through the pipe and draw it back and forth several times, and I believe you will have the rust pretty well out. It might pay you also to call on the physics department at Alfred University for their advice.—I. W. DICKERSON.

Better Roughage Needed

In your opinion is it more important for dairy farmers to grow high protein roughage or to attempt to raise a considerable part of the grain ration?

THIS problem will vary according to each man's individual conditions but in general we believe that the first point that should receive attention is growing better roughage. We believe this for several reasons. In the first place, roughage is bulky and ordinarily cannot be purchased economically. It must, therefore, be raised on the farm and we believe that its quality should be the best possible to grow. In this way the amount of high protein concentrates necessary will be cut down whether they are grown at home or whether they are purchased.

As far as growing concentrates in eastern territory, we believe that the

best quality of grain should be grown but that the usual rotation should not be upset in an attempt to grow all of the concentrates needed on the farm. We believe that any dairyman in New York State can afford to buy most of his concentrates providing he keeps high producing cows and raises a high quality of legume roughage.

Pasteurization Has No Effect On Food Value

Can you please tell me what food value has pasteurized skim milk for calves and pigs. Is it as good as unpasteurized milk?—L.J., New York.

PASTEURIZATION of skim milk has little if any effect upon its food value. It may result in killing some of the vitamins which may lessen its value somewhat.

On the other hand it certainly would have to be pasteurized if it comes from a creamery or sent to a shipping point due to the fact that unpasteurized skim milk is likely to spread disease.

Various estimates have been placed upon the value of skim milk as a feed. Possibly the majority of them place the valuation somewhere in the neighborhood of 30 cents per hundred. At present feed prices many users would place a considerably higher value upon it.

The Plains of Abraham

(Continued from Page 14)

To Henri Bulain, the traitor, who had bartered his honour for an Englishwoman. Over her father's hill, in Forbidden Valley, were safety and mercy at the hands of her country's enemies.

Her lips found a way to cut him deeper.

"Your father and mother are waiting for you," she said. "Go, and leave me here. I prefer to wait for the return of your Indian friends. And I am not sorry because I tried to kill you!"

He moved away from her to where Hebert and Juchereau and the simple-minded Raudot lay on the ground. This time it was the idiot's coat he took, a fine coat made by the idiot's mother. The boy had loved birds and flowers, and on the lapel of the coat was a faded geranium bloom. Jeems took it off and tucked it between the dead lad's fingers.

Then he went back to Toinette and said, "We had better go." After that he added, "I am sorry, but I must go to my mother and father first."

He staggered as he set out, and Tonteur Hill dipped and wobbled before his eyes. There was an ache like a splinter twisting in his head, and as she followed him, Toinette could see the effect of her unresisted blows with the iron gun barrel. For she did follow, out of the smoke fumes into the clearer air of the meadows and across them to the worn path that led to the Indian trail and the home of Catherine Bulain. She followed as if drawn by chains, but after a little the weight of these chains seemed to leave her, and when Jeems stumbled and caught himself from falling, she almost breathed a cry. The hardwoods swallowed them, and about them now even more than in the earlier morning were the warmth and golden riot of the Algonquin Indian summer which precedes the killing frosts and the opening of the chestnut burrs. In this autumnal peace and quiet, gentle with the subdued notes of birds and with the fragrance of a ripened earth between her and the blue of the sky, the bitterness she was fighting to hold against the one ahead of her became almost dispelled at times. Tipster Sheet Operators Run for Cover

MR. GEORGE MINTZER, Assistant United States District Attorney, is in charge of a drive in New York City against tipster sheet operators and bucket shops. Recently he led a squad of Post Office inspectors to the offices of the Financial Counsellor, a tipster sheet at 170 Broadway, and the Cosmopolitan Fiscal Corporation, at 225 Broadway. In both places it was found that the occupants had suspended operations, leaving one person to watch over the unoccupied desks. Subpoenas had been served upon a number of persons connected with these firms in an attempt to bring them to justice.

A raid was also recently made on the office of Anderson & Co., 40 Exchange Place, publishers of a tipster sheet, and thirty people were subpoenaed and examined by the Grand Jury. An order for examination of the Cosmopolitan Corporation of Brooklyn was recently issued and a Mr. Goldhurst, who was supposedly the organizer of the new concern, was enjoined from selling securities.

How to Recognize Tipster Sheets

Charles Tuttle, United States District Attorney, feels that these raids indicate that a number of similar concerns have gone out of business on account of the campaign against them. We thoroughly approve of these efforts to drive tipster sheets out of business, but one of the unfortunate features of any campaign is the fact that evidence must be secured sufficient to warrant the conviction and this necessarily means that some people must be defrauded before a conviction can be secured. Fortunately, tipster sheets and those operating them have certain earmarks which can be readily recognized by anyone who is at all careful about making investments. It has been pointed out on various occasions that the surest way to put these tipster sheets out of business is for the public to learn of their operations and refuse to patronize them. A tipster sheet, by the way, is a publication which claims to give valuable advice on investments. Frequently it contains some good advice, but along with it is a glowing writeup of some stock which is practically valueless, and the price of which is manipulated up and down to suit the desires of the operators. Frequently these tipster sheets hire a number of men who do nothing but make long distance telephone calls to prospects or "suckers" all over the country.

A few earmarks by which tipster sheets and bucket shops can be recognized are:

1. They promise glowing returns of 10, 15 or 20 per cent on your investment, or in fact almost anything to induce you to "bite". In general, the safety of an investment can be judged by the return promised as 6 or 7 per cent is usually the maximum which can be secured with absolute safety.
2. They are always in a hurry and try to convince prospects that it is necessary to invest immediately in order to reap the rich rewards which they promise. Any investment which cannot wait for investigation can well be let alone entirely.
3. You may well look with hesitation on any concern which calls on you by Long Distance telephone and urges you to buy stock.

Those who have made a study of "fake" investments, estimate that millions and millions of dollars are fleeced from American citizens every year. The AMERICAN AGRICULTURIST Service Bureau is continually getting letters from subscribers, telling of stock bought and asking us to secure the return of their money. Those who investigate first and who are satisfied with reasonable returns on their investment, are in little or no danger of losing the principal which they have invested. If our sub-

scribers have been solicited by bucket shops and tipster sheets, we will be glad if they will write to us, giving

Promptness Appreciated

ACKNOWLEDGEMENT of your letter under date of July 1st has been delayed but nevertheless let me thank you for the promptness in forwarding draft to me in the amount of \$107.14 covering insurance protection during my inability to attend to any work and laid up from results of an automobile accident.

I cannot commend too highly your protection given the American Agriculturist subscribers through this insurance and indeed it is a great assistance to have such splendid support at a time when expenses cannot be withheld. I will always be a booster for your coverage and your promptness in payment deserves special mention.

While my recovery will not be in full for some length of time, I am very happy to be able to walk around with the assistance of a cane and attend to my work once again.

(Signed), Clara L. Matteson,
New Berlin, N. Y.

their experience, and we will turn the evidence over to Mr. Tuttle, United States District Attorney.

Another Rabbit Concern

What can you tell us about the Rabbit Corporation of America, whose headquarters are 240 West 27th Street, New York City, and also have a place of business in West Washington Market?

We understand that recently several pet stock publications carried advertisements of the Rabbit Corporation of America, and at the same time published some editorial comment. We find that the officers of this organization are Julius Davison, president, David Mayer, secretary, and Marcellus W.

Meek, general manager. We understand that Mr. Meek, has in the past, been associated with several rabbit firms, namely; Meek & Court, Chicago, Ill., Golden West Fur Farms, Arcadia, Cal., and the American Rabbit Association, Los Angeles, Calif. None of these, we are informed, are now in business.

We also understand that the Rabbit Corporation of America made application to Commissioner Dwyer, of New York City Markets, for space in West Washington Market. Objection was filed to the granting of this space, and a hearing was conducted for the purpose of giving all parties a fair deal. A committee appointed disapproved the application of the Rabbit Corporation of America for stand space, and reported their findings to Commissioner Dwyer. The Rabbit Corporation of America then requested a hearing which request was granted, and the date being set for June 17, but for some unknown reason, we are informed that the Rabbit Corporation of America requested that the hearing be called off.

Charge It To Experience

Some time ago two fellows came to my store selling hams. They guaranteed them to be homecured and of excellent quality. I paid 32c a pound for 18 hams and gave them a check for \$42.48. We found the hams to be very ordinary quality, so I wrote and explained everything and asked them to come and get them, but have heard nothing from them. I made the check out to Stanley Brennan, Springfield, New York.

OUR letters to Mr. Stanley Brennan have been returned to us marked "Unknown" so it appears that our subscriber must charge his loss up to experience. If any of our readers have had a similar experience, we would be glad to have them write to us. Although we cannot guarantee to get the return of the money a warning to our readers may prevent further loss.

No Forwarding Address

About four years ago I took a course in printing and showwriting with the American Showcard system, of Toronto, Canada. I paid \$30. for the course and paid in advance, as it was cheaper than to pay for installments. I sent in three or four lessons and then the next one I sent was returned to me marked "Gone out of business". Could you tell me if they are still in existence?

THIS company has gone out of business, without leaving any forwarding address.

Lubricating Oils Look Alike

BUT one oil is packed full enduring service---miles of quiet sweet running on the road---days of surging tractor power in the field---a purring motor with abundance of power.

Another oil breaks down. You keep putting in more, but bearings grind, pistons drag, valve stems scratch. You get less power from the motor; you wear it out because of poor lubrication.

You can't tell the difference between two oils by looking at them. You rub a drop between finger and thumb. It looks as

if you could tell something that way, but you can't. An oil that looks and feels heavy and smooth when it's cold, may turn to a thin watery liquid with little lubricating value, in the intense heat of the cylinders.

The right way---the economical way, to tell the difference is to trust the *trade mark* on a reliable, well advertised oil. That trade mark carries the backing of honorable men, and the word of expert chemists---men who know. That's the way to be sure of good oil.

A Hardy Strain of Red Clover

Results on Cortland County Farm Show Importance of Seed Source

By E. N. REED

IN the issue of February 16 I wrote a short article on red clover. I mentioned sowing some seed last year grown in northern Montana as well as a very hardy strain a new neighbor brought to this section. Now haying time is over and clover has been harvested. I have carefully noted these two strains sown side by side. I certainly am convinced that there are certain strains of clover much better adapted to the northern part of this country than others even though the seed is grown in a northern section. The hardy strain my new neighbor brought in is much superior to that grown in northern Montana. My father-in-law also sowed a little of this hardy seed but did not have enough to sow his entire field. The seed he lacked was secured from a local dealer. The results were most striking to say the least. Practically all seeding looks good this year but if we could all secure a strain better adapted to our conditions our seeding would look better still.

Clover the Second Year

I visited the neighbor from whom I secured this hardy seed the other day and we went out to see his fields. He had one eight acre field which was seeded down last year in oats. This field he told me had not had a load of manure on it since he owned the place and his neighbors said they believed it had not been manured in thirty years. He certainly had as fine a stand as any one could ask for. I inquired what he did to get such a catch and he replied that he simply sweetened up the soil with lime, sowed two bushels of oats, four quarts of clover and one quart of timothy per acre. The seed was inoculated. He asked me to come and see his seeding that was two years old. As we walked across the field I

remarked that he had as much clover the second year as most of us get the first. "Yes", he said, "this is true and I believe the reason is because I gave the clover a chance. I did not smother it with an excessive grain seeding or timothy." He asked me if I ever had heard of a man raising clover by sowing timothy seed? If so he would very much like to know how it was done.

I have been in touch with Professor Barron of our state college at Ithaca, New York in regard to clover and I think he believes as I do that some of us have got to grow a little clover seed of our own. Professor Barron is doing quite a lot of strain testing of clover. I let him have a little of my hardy seed to include in his test plots. If any one is interested in growing a good strain of clover for seed I think Professor Barron has information which would be of value. One man near Batavia, New York sees the possibilities in such work and is going to produce some seed. Good clover seed is a crop farmers need not worry about finding a ready market for at top prices. My neighbor tells me clover yields from one to five bushels of seed per acre, depending upon how soon the hay is cut the first time. The heaviest yields of seed are secured by moving the first cutting early. Then the second cutting has a very early start and is quite sure to ripen its seed. All red clover seed comes from the second cutting.

Clover Seed As a Cash Crop

Hundreds of farmers are studying what to grow for a cash crop. It seems as though clover might help some solve the problem.

I have often wondered if we did not lose a lot

of our young clover by early sowing especially if the little plants were up during frosty nights. I decided to test this out for myself so I put one hundred seeds in a shallow box the last of March. I left this box in the house until the plants were up, ninety-six in all. I set the box out of doors on the north side of the house where there was no more than one hour of sunshine during the day. The second day after I set it out there came six inches of snow. June first I counted the number of plants still alive. There were eighty-four. Two got washed out in a heavy rain and I do not know what happened to the other ten, but I am sure this is a very creditable showing. These plants went through numerous freezes. One morning the thermometer was twenty-six. The dirt was frozen so hard around the plants that I could not break it with my finger.

Difference in Second Growth

Haying is now over and the abundance of rain in this section has given after feed a good start. I just went out to see if there was any difference in the two kinds of clover which I mentioned above. Where the northern Montana seed was sown there is scarcely a stalk of second growth showing while the other hardy strain has made a fine start.

I just took a little motor trip covering central and western New York. While most all clover has been cut I could see there were many good pieces this year. The section west of the Finger Lakes has suffered from dry weather to quite an extent all during the early part of the summer. Light rains have relieved the situation a little lately but it is still quite dry. Being a farmer

Good Pastures Mean Economical Milk Production

Soil Fertility Often Too Low to Grow Palatable Grasses

By H. P. COOPER

Cornell University Agricultural Experiment Station

In New England and in portions of New York Pennsylvania and New Jersey, Rhode Island bent grass is abundant on the poorer soils. On the better soils it is accompanied by Kentucky blue grass and white clover. While on the unproductive acid soils it is generally accompanied by red top, sweet vernal grass and poverty grass.

White Clover is one of the widely distributed pasture plants in the northeastern states. It is most abundant in closely grazed pastures on relatively fertile soils. But it does not grow well

during the hotter and dryer portions of the season.

Kentucky Blue Grass is one of the best pasture grasses. It is the most common pasture plant on the relatively fertile soils well supplied with available lime, phosphorous, nitrogen and potash. It is one of the most palatable pasture plants, because it only grows well on the fertile soil well supplied with the soft and palatable plant food materials. It is common in many night pastures and in most of the better valley pastures in every section of the region. It grows very little, however, during the hotter and dryer portions of the season, which is often the critical pasture period.

Rhode Island Bent Grass is very sensitive to warm dry conditions. The peculiar climatic requirement of this plant definitely limits its usefulness as a pasture plant to regions which are relatively cool and moist. Since this plant grows successfully on relatively poor soils, it is a very important pasture plant in the hill pastures of the regions which have a relatively heavy growing-season rainfall. This plant is often less palatable than Kentucky blue grass as it grows on relatively poor soils and often contains relatively large amounts of the hard and unpalatable plant food materials, such as silicon, iron, aluminum, and manganese. Where the rainfall is sufficient this plant grows rapidly during late July and August and it often supplies good pasturage during the critical

(Continued on Page 9)

GOOD permanent pastures are necessary for a successful large-scale dairy industry in this region. Without good pastures the dairy farmers in this region have difficulty in competing with other regions where the soils are naturally productive. While this region is favored with a suitable rainfall, it often results in a rapid removal from the soil by drainage of available plant food materials. Many of the soils in this region have become too low in plant food materials for the successful growth of the more desirable and most nutritious permanent pasture plants. So long as there was available uncleared virgin land, well supplied with available plant food materials, which could be cleared and utilized the pasture requirements were fairly adequately met. The rough and relatively inaccessible lands often produce good pasturage for a long time.

At present there is a widespread interest in pasture problems throughout the eastern part of the United States. We are beginning to appreciate the great economic importance of the pastures to the dairy industry. The northeastern states cannot afford to lag behind the other section in the production of their most economical source of animal feed.

The principal pasture plants in the northeastern states are Kentucky blue grass, white clover, Canada blue grass, Rhode Island bent grass, and red top. Kentucky blue grass and white clover are by far the most desirable and the most widely distributed pasture plants in this region.

Good pasture is a profitable crop. Heavy producers cannot maintain their milk flow and depend on poor pasture for their feed.

Vol. 124 September 7, 1929 No. 10

State Tax Savings Should Be Passed On To The Taxpayers

ON the news page in this issue we are printing Governor Roosevelt's recent letter to the taxpayers in rural counties. In our opinion, the legislation passed at the last session of the State Legislature, as a result of recommendations of the Governor's Agricultural Advisory Commission, is more important to farmers than any passed in years.

At the same time, there is a limit to tax relief which can be provided by state legislation. For years American Agriculturist has maintained that the largest farm tax burden comes from local taxes. Governor Roosevelt points out that the savings made to farmers will be of little benefit to them unless they are passed along by the county governments. We believe that every farm taxpayer as well as local farm organizations, should interest themselves in this question and insist that their board of supervisors does not increase local expenditures and absorb all or a considerable part of the saving.

State Is Buying Cheap Land

OVER last week end we drove over many of the hills in the country where we grew up, and the outstanding impression gained was the rapidity with which our hill lands are going back to brush and woods. In a lot which we once helped to raise a piece of potatoes twenty-five years ago and which we remember as being rather fertile, there is now a healthy growth of young trees. It was even difficult to recognize the field and to realize that it was not so long ago that it was under cultivation. Another quarter century and old Nature herself will do a lot of reforestation of these worn-out hills.

In a recent radio talk from WGY, Arthur S. Hopkins, assistant superintendent of lands and forests of the Conservation Department of the State of New York, told of the market that has been made for abandoned farms by the new laws which make it possible for the State and the county to buy up worn-out lands for forest purposes.

We discussed these laws in AMERICAN AGRICULTURIST last winter when they were passed. One provides that the State will match the county's appropriation dollar for dollar, not ex-

ceeding \$5,000 in any one year, for reforestation projects in the county which are approved by the Conservation Department.

The other law provides an appropriation for the buying of by the State itself and the planting of trees on abandoned farms. Under this law, the Conservation Department has already acquired nearly three thousand acres in Cortland, Chemung and Otsego Counties at an average price of \$3.15 per acre.

No one should fool himself into believing that he can sell land to the State at a high price. The land sold must contain at least five hundred contiguous acres and should be so located that other acres can be added to the plot. If any who read this have such large plots for sale at a very low price, it might pay them to get in touch with the Conservation Department at Albany, New York.

Tractors Cost Less—Run Longer

IN 1919 the New York State College of Agriculture took records from a number of New York State farms to determine what it costs to operate a tractor. They found that the average cost per hour was \$1.15, without figuring in the cost of the operator's time. This \$1.15, of course, considered all costs, including depreciation, interest on investment, repairs, gasoline, oil, etc.

Since that time tractors have been improved and in 1926 the State College collected a set of similar figures. This time the average cost per hour of operation was 72c, a reduction in cost of 43c per hour since 1919. This difference was due principally to lower depreciation, lower interest charges due to lower tractor costs and lower repair bills.

These figures are interesting for several reasons. In the first place, they show that the manufacturers of tractors and other farm implements are continually striving to sell a better product for less money. The average price of tractors has been reduced about one-third since 1919, while at the same time, the tractors put out need fewer repairs and last longer. In the second place, it is interesting to compare this trend with production of farm products. If manufacturers of farm machinery find it necessary to improve their product and at the same time reduce prices, why it is not logical that producers of farm products must also strive to lower production costs?

Much has been said about the desirability of higher prices for farm products, yet it is generally acknowledged that the producer has relatively little to say about the price he receives.

If prices are good, the result is over-production until prices again drop. Up to date no one has found a practical way in which to control production. Cooperative associations may get a fair price for their members, based on market conditions, yet even they cannot set an arbitrary price and maintain it. Every producer, however, has a lot to say about production costs. Continual study along this line is likely to increase profits more than dependence on legislation.

Tragedy Follows Farm Trespass In New Jersey

CRAIG Hoffman, a Somerville, N. J. farmer, has been arrested on charges of murder following the shooting of one child and the wounding of three others while they were in Mr. Hoffman's corn field recently. He was held without bail in the Somerset County jail to await Grand Jury action. Two of the injured children, Helen Klementovich, and Anna Kolesar, fourteen year old sister of John Kolesar who was killed, identified Hoffman as the man they saw walking in the corn field with a gun in his hand. Joseph Klementovich, ten years old, is also in the Somerset Hospital suffering from numerous wounds.

It is reported that two wounded children admitted to Prosecutor Francis Bergen that they had gone to the Hoffman farm to steal corn. Following an all-night questioning of Craig Hoff-

man and his brother Grover Hoffman, during which both vigorously denied that they had shot the children or that they had even known the children were on the farm, formal charges were filed by Prosecutor Bergen against Craig Hoffman.

It is reported that sentiment in the town is divided. Townspeople feel that the Hoffman brothers were in some way responsible for the shooting and the feeling against them is strong. On the other hand, farmers regard the Hoffman brothers as citizens of the highest character. They declare that all farmers in that section have suffered heavy losses from theft and, that certain parents teach their children to steal from farmers' fields, knowing that they will get off lightly if caught. Many believe the statements of the Hoffmans that they had nothing to do with the shooting but at the same time they feel that if a penalty is imposed upon the person who fired the shots, that it will set a precedent which will strip them of their right to protect their property from theft.

While we do not approve of anyone taking the law into his own hands in this manner, we do feel certain that while human nature is as it is, similar tragedies will continue to occur so long as the property rights of farmers continue to be ignored as they are at the present time. Who can blame a farmer for attempting to protect his crops from theft when he has worked an entire season to produce them? The feeling that it costs the farmer nothing to grow his crops and that anything which is in an open field is public property is altogether too prevalent. A vigorous campaign to protect farm property will go a long way toward preventing such tragedies.

We Are Glad to Help

"The material arrived on time and we won the debate. It was excellent material and contained the right information. I wish to thank you for your kindness and interest you took in this matter. It was of great assistance to the Scottsbury Grange."—R. J. C.

THIS letter is a sample of many that we receive thanking us for the various kinds of programs we furnish free of charge, except for the postage, to Granges and other local farm meetings. This material includes suggested programs for discussing the farm tax situation, several mock trials, and the arguments on both sides of many debates of outstanding interest. If we can help you with your program, that is what we are here for.

A Majority Stays in Farm Work

IT is encouraging to know that according to a recent survey made by the Department of Agriculture, a larger percentage of the boys studying agriculture in high schools stay on the farms than those who do not take the agricultural courses. There is always some claim being put forward that agricultural education trains away from the farm, but now there are actual figures to show this is not so. It was found that from sixty to seventy-five per cent of the students given vocational instruction in agriculture are now in agricultural work.

Eastman's Chestnut

ANYONE who has watched two confirmed checker players sit by the hour and make a move about once every five minutes will appreciate the following story:

A traveling salesman dropped into the general store but found no one but two persons who apparently wanted to make some purchases. Searching around he stepped into a back room and found the proprietor playing checkers with one of the old settlers.

"Do you know that there are two customers out in the store?" said he to the proprietor.

Taking his pipe out of his mouth and spitting into the nearby sawdust box, he replied "That's all right. Just keep quiet and they will go away in a few minutes."

Horseshoe Pitching Prize Goes to Chenango Co.

Seventh Annual State Fair Contest Surpasses All Others

"HORSESHOES," remarked Andy Gump, "is the best game invented by man since Adam slammed the front gate of Paradise. Look at golf—you have to buy clubs, bags, balls; have a professor to teach you and a caddie to guide you before you hit the first ball. Even though you are able to borrow a lawn, without buying a net, racket and balls there can be no tennis; polo costs a fortune; base ball requires bats, balls, gloves and money for their upkeep; even a deck of cards will wear out; but if your grandfather dies and leaves you a set of horseshoes you can start right in without a teacher and enjoy a great out-door sport for the next hundred years without spending a dime."

Best Contest in History of Event

If grandfather could have only looked over the fence at the bunch of pitchers that had come from more than thirty counties representing all parts of the Empire State as they gathered at the fine clay horseshoe pitching courts provided by the State Fair authorities at Syracuse for the use of the contestants at the seventh annual tournament sponsored by the AMERICAN AGRICULTURIST-Farm Bureau which began Tuesday, August 27th, at 11 A. M., he would have rubbed his eyes and gazed in wonderment at the skill his grandsons had developed since he used old Dobin's cast off footwear in his friendly games in the barnyard.

Last year a six-foot four, sixteen year old boy, Walter Shackleton from Walton, Delaware County had won the highest honors, and the same county had won the previous year. This year George Adams, 62 years "young" from Norwich, Chenango County won the highest honors,—the first prize of fifty dollars and the suitably engraved beautiful championship gold medal, as hundreds of the State Fair visitors almost held their breath in tense excitement as they watched the deciding shoes pitched.

Need for Elimination Series

At about eleven o'clock Tuesday morning, because there were so many entrants the eliminations began. It had been decided to have each contestant pitch 50 shoes to qualify and the sixteen men that made the most points, counting each ringer 3 points and each shoe within 6 inches of the peg one point, were each to pitch each other one 25-point game in the preliminaries.

The results of this qualifying play is given in the accompanying table, arranged according to the highest number of points made by pitching 50 shoes.

The contestants from a number of counties did not appear. These are as follows:

Bert Yates, Gloversville, Fulton; Hiram Conklin, Huguenot, Orange; Leroy Looman, Duanesburg, Schenectady; Clarke Drake, Warsaw, Wyoming.

Essex, and Herkimer counties had signified their intention to send contestants but for some unexplained reason the names of the men were not sent in neither did anyone appear to represent these counties.

As long as the AMERICAN AGRICULTURIST-Farm Bureau Tournament keeps as popular as it seems to be at the present time, some form of elimination will have to be followed each year in order to complete the tournament in the two days for which it has always been planned. It is suggested that the players practice pitching 50 or more shoes alone so that when they are asked to pitch in such an elimination as this, it will not be a strange procedure for them.

A full report of the preliminary round robin play in which the sixteen men not eliminated took part and the finals in which the six men standing the highest in the preliminaries took part will appear in the AMERICAN AGRICULTURIST next week with a detailed story of the best games and the wonderful pitching the men did in this tournament which was the best considering it from

every view point that has ever been held at the State Fair.

Around the State

By FRED MORRIS,

Assistant County Agent Leader of New York State

W. C. HUBBARD, county deputy of Oswego County Grange, and for the past six years president of the County Farm Bureau, told me that although the pasture

BY D. D. COTTRELL, Secretary of the National Horseshoe Pitchers Association.

told me that he found dairymen all over that section feeding more grain and green feed than ever before. In his three Dairy Herd Improvement Associations last June (1928), ten out of fifteen of the high herds for production that month averaged below 40 pounds of milk per cow a day. In June 1929, none of the 15 high herds were below 40 pounds. They averaged 50 pounds a day. In the 75 herds in the 3 associations, the testers reported that there was a marked increase in June 1929 production over June 1928. This is an indication of what the North Country dairies are doing.

was fairly good, he was feeding new cut hay twice a day in the barn and the cows were cleaning it up. He never followed this practice before, he said. He grinds his oats and barley for summer feeding and is increasing the amount fed to prevent further shrinking. Mr. Hubbard is a master dairyman because he admits he can always get more milk in the barn than he can on good pasture. His herd average has been better than 11,000 pounds for the past three years.

* * *

I was up in St. Lawrence County recently and Mr. Claus, the county agent,

Jefferson County, is a good breeder of Holstein cattle. The fact that he has a well planned breeding program proves that statement. He has one of those cows that just naturally makes milk out of all the feed she can get, one of those tissue-paper-hided cows with an open back and lots of temperament showing all over her. She milked this past year 17,658 pounds of milk and 575.3 pounds of butterfat on two milkings a day. Her name is Weaverdale Quality Lola Korndye. I remember a cow just like her that Frank Mandigo, at Pulaski, Oswego County, owned. She gave 20,000 pounds in a year, then 14,000, then 16,000. She was a wonderful cow.

My Favorite Poem

Every Thursday at noon, radio station WGY broadcasts selections from famous poems and poets which are called "Visits With The Poets Of The Farm and Home". For several weeks we have suggested to our readers that they listen in on this program and send us their favorite poem.

Miss Gertrude E. Peck of Worcester, N. Y. sends us "It Couldn't Be Done", by Edgar A. Guest. This poem has given encouragement to thousands of discouraged folks all over the country and we know that our readers will agree that it is an excellent selection.

It Couldn't Be Done

BY EDGAR A. GUEST

Somebody said that it couldn't be done,
But he with a chuckle replied
That "maybe it couldn't" but he would be one.
Who wouldn't say so till he'd tried.
So he buckled right in with the trace of a grin
On his face. If he worried he hid it.
He started to sing as he tackled the thing
That couldn't be done - and he did it.

Somebody scoffed, "Oh, you'll never do that,
As no one ever had done it,"
But he took off his coat and he took off his hat,
And the first thing we knew he'd begun it.
With a lift of his chin and a bit of a grin,
Without any doubting or quiddit,
He started to sing as he tackled the thing
That couldn't be done - and he did it.

There are thousands to tell you it cannot be done;
There are thousands to prophesy failure;
There are thousands to point out to you one by one,
The danger that waits to assail you,
But just buckle in with a bit of a grin;
Just take off your coat and go to it;
Just start in to sing as you tackle the thing
That "cannot be done" - and you'll do it.

One of her bull calves sold at the First Oswego County Dairy Field Day for \$65.00 at six months of age. Charles Loren, Central Square, bought him. He is producing some wonderful stock.

Four Counties Have Dairy Improvement Councils

DAIRY Improvement Councils have been formed in four New York State counties. In general these Councils will endeavor to impress all interests, both city and rural, with the importance of the dairy industry. In Oswego County the Council sponsors the dairy record work. In Montgomery County the slogan is "Quality Milk." In Otsego County a five year better bull campaign is under way, and in Tioga County the Council is sponsoring dairy record work. Each County has as one of the features of its annual program a Dairy Field Day and Sale, with a Junior Calf Club Exhibit and other features of interest to dairymen. Plans are under way for the starting of a Dairy Record Club in Orange County, whereby samples will be sent to a central office by mail instead of having the cow-tester travel from farm to farm, as has been the custom in the past.

New York Seed Potato Growers Hold Successful Tour

RECENTLY the New York Cooperative Seed Potato Association held its second annual tour in western New York. At one time, 134 cars were in line. Stops were made at a number of seed producing farms and a number of talks of especial interest to seed growers and table stock producers were given.

Fear Serious Infestation of Mexican Bean Beetle

INDICATIONS now point to the most serious infestation of the Mexican bean beetle in New Jersey, this coming season, that the state has ever known. Following a tour of inspection of the South Jersey counties by R. C. Burdette, Associate Entomologist of the Experiment Station at New Brunswick, he reports that the hungry pest is already growing restless and will soon be ready to emerge from the ground. In discussing this matter with County Agent White, of Cape May County, he stated that he had found single hills of beans, in Cape May County, standing from last year, with 30 to 40 adult beetles under them. He further stated that about 80 per cent of the overwintered beetles are alive, which indicates a heavy infestation if conditions are favorable during the growing season. In describing the beetle situation Mr. Burdette advises that the adult beetles will take flight possibly within the next two weeks and will lay eggs from which the destructive summer brood of larvae and adults will develop.

The Mexican bean beetle was observed last year in various parts of Cape May, Atlantic, Cumberland, Salem, Gloucester, Camden, Burlington and Monmouth Counties. This represents nearly 80 per cent of the bean area of New Jersey.

So serious has the situation become that the Experiment Station is placing Mr. Burdette in South Jersey, this summer, to do experimental work on this insect and on the pepper maggot. A comprehensive spray program will be recommended to aid the growers in combating the pest. Great hopes have been placed in the control of the beetles by the use of Magnesium Arsenate, which is one of the newer insecticides recently developed. This material can be used in the spray or dust form. While the control measures are not yet down to a scientific basis it is hoped that the work of Mr. Burdette will enable the growers to satisfactorily meet the situation.

A Good Record

GEORGE WHITE, of Cocksackie, N. Y., owns a Guernsey cow, Gayheads Honey-suckle, which has recently made an excellent record. The production for this cow for 84 days is 5,573.5 pounds of milk, and 239.01 pounds of butterfat.

*When unusual strength
is needed*

THE Kelly Heavy Duty high-pressure pneumatic is a truck and bus tire in which are combined to an unusual degree all the qualities desirable in a tire of this type.

Its deep, notched tread affords extra cushioning on hard roads and extra traction in soft ground. The carcass is of exceptional strength and elasticity.

For hard service there is no pneumatic tire built that excels this one. You will find its use on your truck or trucks real economy.

Ellis Champion Threshers For the Individual Farmer

The Thresher that can be successfully run with a popular sized tractor is a great investment. It will pay for itself in two years' running. Our long experience in building small threshers has enabled us to offer a REAL CHAMPION.

A big guarantee accompanies each machine. We build four sizes, which, depending on the attachments and equipment ordered, require from 3 to 30 horse gasoline engine power. Wood or Steel Frames, light in weight, simple in construction, durable, requiring a minimum of power, yet doing exceptionally clean work. Our prices are right, and we will be glad to furnish details and literature upon request.

A.A.'s Western New York Farm and Home Talk

A Trip to the Corn Belt

A TRIP to study the increase in the growth of the Soya bean industry and the limitations to its further development in the Middle West has taken me on a 1600 mile automobile drive through central and northern Ohio, Indiana and Illinois during the past week. The increasing use of soya beans as a source of protein, particularly in dairy rations and the reasons for it, is in itself an interesting and important story for Eastern dairymen. I shall reserve that for an opportunity to sketch it more completely. I thought that many AMERICAN AGRICULTURIST readers might be interested in hearing of farming conditions as we find them out here.

M. C. Burritt

The first fact to be noted is that conditions are very spotted and that it is difficult to generalize. As in our own state there is a wide variation in the prosperity of different farmers. This is probably greater even than during the war. Many farmers are ruined and have lost their farms. Others tell us that they never had more prosperous years. This is also true in Western New York. We learned of a farmer out here who paid \$120 an acre, cash, for a rather poor farm during war times which the former owner had been unable to sell for \$65 an acre before the war. Now the present owner is unable to make the farm pay and will lose it all. Another farmer has bought a farm for \$150 an acre since the war and has nearly paid for it.

Adjusting Farm Operations To Meet Changes

These wide variations are due to several causes. Inflation of land values during and after the war ruined many. But the wide fluctuations in market prices and the sudden changes in types of farming which many farmers failed to appreciate and to adjust themselves to, are mainly responsible. Farmers who saw these changes and who were able to adjust themselves to new opportunities and to get out of losing enterprises have been able to make money. In some cases this has involved the purchase of large and expensive labor saving equipment. In other cases it has been a shift from selling cash grain to feeding it to livestock. But many farmers have not been in a position to do this. Where they were heavily mortgaged or tenants such shifts were frequently impossible. As a result banks, estates, insurance companies and others have acquired many farms and with them the problems that farmers are up against. One insurance company in one state alone owns three hundred and fifty farms, acquired because of the inability of the farmers to make their payments.

Livestock Farmers Prosperous

In general the livestock farmers here as in the East are in the best position. The dairy industry is of course much more limited here than in the New York milk shed. But there is a large and growing number of towns and cities to be supplied with milk. Milk production will increase slowly in the corn belt, however, because farmers here are not dairymen either by training or inclination. They have no dairy barns or equipment and the custom and habit of a different type of farming will be slow to change even if it were more profitable in the long run. The cattle and hog feeders who are converting relatively cheap grain, soy beans and sweet clover pastures into

relatively high priced beef and pork, are the ones who are making the money and buying more farms.

The small grain crop is fairly good out here. A wet early spring was prolonged through much of June and made for late planting of oats and corn. Wheat yields in Ohio and Indiana were not large but fairly good and the recent improved prices have encouraged farmers. Oat prices are also somewhat better than usual but this crop is the least profitable of any grown here. Soya beans are increasing in acreage every year, especially in Indiana and Illinois. Threshing of wheat and oats is pretty well finished. Most of it is done in the fields, and everywhere one sees the piles—not stacked—of straw, in the fields where the threshing was done. Some of this is baled and shipped, but the price is so low it hardly pays.

Corn Is King

One is always impressed with the big and continuous fields of corn of western Indiana and Illinois. Every farm has from 30 or 40 to 300 or 400 acres of corn. At times one rides for miles along these straight concrete roads between almost continuous cornfields and cannot see the horizon on either side. The corn crop will not be a large one this year but fairly good, especially in Illinois. Farther east dry weather has hurt it and reduced the crop, but the last thirty days of hot weather have been great for corn. Upon the size and price of the corn crop the prosperity of much of this region primarily depends. It is the one big crop for sale.

The clover crop is unusually good out
(Continued on Page 10)

A Hardy Strain of Red Clover

(Continued from Page 3)

I could not help taking notice of the other crops, such as corn, potatoes, cabbage and wheat.

Many growers were disappointed in the wheat crop when they came to thresh it. In the spring it looked unusually good but lack of moisture prevented a full crop. Wheat is nearly all cut and quite a portion either threshed or put under cover.

Potatoes look fairly well considering the season. I talked with a few large growers around Batavia where quite an acreage is grown. It seemed to be their opinion that the crop is a little spotted and the acreage not quite up to normal.

Corn looks rather poor, however, there are a few good pieces. In many cases it looks as though the growers did not get a good stand. Much of the seed corn this spring did not show any too good germination. Corn looks much better here in the four central dairy counties than in western New York.

My brother-in-law from Orange County, New York, who is an apple grower, accompanied me on my trip. He thought the fruit situation looked rather poor as compared with the Hudson River valley. The Hudson River growers do not feel as though they have over two thirds of a crop. They are hit very hard by dry weather. Apples should bring a price this fall.

The cabbage acreage perhaps is nearly normal. There are a few spotted pieces as it was very dry everywhere for quite a period at early setting time. Ontario County seems to have suffered less from drought than cabbage sections farther west. The Danish in the central dairy counties looks very good. On the whole perhaps one might consider the crop normal for this time of year. Late rains have a large bearing on the final yield so it is hard to definitely judge at present. There seems to be very little disease. The dryer season has not been as favorable to club root development as last year.

Cutting upkeep..

*your biggest
item of expense*

It's just the same thing with dairy cattle as with automobiles—it's not so much the first cost as the upkeep. Fifty-eight per cent of the money you spend in supplying milk to the consumer goes for feed alone. This is greater than all your other expenses combined.

Obviously, it is very much to your advantage to keep your feed cost as low as possible. But it is equally obvious that the way to economize on the ration is not to buy on price alone, but to buy a feed that will accomplish certain desired profit results in production.

The need for more productive, instead of cheaper, feeds has long been recognized by the Park and Pollard Company. They realize that if their customer-partners are to make more money, their feeds must get greater results.

The vast machinery of their organization is concentrated upon the one aim—greater

profits for the feeder. This means better feeds, and that is their responsibility.

In developing better feeds, the study of animal nutrition and the dietary needs of the cow for production and health are essential. An extensive research laboratory and large experimental farms have long been established for the purpose of study. They are

at once the creative forces and the proving ground behind Park and Pollard feeds. Their discoveries have already been instrumental in revising feeding practice to the profit of the feeder; and they are a perpetual assurance that Park and Pollard feeds will always be abreast or ahead of the times.

Remember, the feed that gets more production and more profits is the feed that cuts your biggest item of expense.

Are They Good for an EXTRA CAN This Fall?

The tang of Autumn in the air means extra profits in the pockets of keen dairymen. Milk prices are higher, feeding begins in earnest, silos and hay lofts are bulging with the year's harvest. Summer-fed cows are in good condition and producing amply and regularly as the Fall season swings into its stride . . . in short, things around the dairy farm are beginning to look up again.

Make this Fall and Winter campaign the most profitable one you've had yet. Get that extra can—or two extra cans—of milk you've always known you *could* get with just a little more efficiency in your feeding.

Diamond Corn Gluten Meal

fed in the right way with other feeds and homegrown grains has made extra cans of milk for many a dairyman. It will do the same for you. Let us tell you how, or if you prefer a ready-mixed feed, we can recommend good ones for all seasons.

How to Prevent and Treat Garget

WE are continually getting letters from dairymen, asking how to treat garget in the herd. Although we have discussed this problem several times, we feel that it is so important that it will bear frequent repetition. In the first place, this is a trouble which should not be neglected. Letters frequently give symptoms indicating that the disease has been in progress for some time and it is very difficult to effect a cure. After a quarter produces no milk and is badly swollen, it is practically impossible to prevent the loss of it.

Prevention is Important

Garget is contagious and in order to prevent its spread to other animals in the herd, certain precautions must be taken. First, any animal that has garget should be removed from the herd and kept in a separate part of the barn until she has recovered. She should be milked only after the other cows have been milked and the affected quarter should not be milked until after the milk has been drawn from the healthy quarters.

Milk from an udder affected with garget contains millions of bacteria which will cause the disease. The bacteria usually gain entrance to the udder through the teat canal and so every precaution must be taken to prevent infection.

Professor H. J. Metzger, of the State College of Agriculture, tells us that some herd owners prevent infection by dipping the ends of the teats of all the cows in the herd in a weak solution of some coal tar disinfectant immediately after milking. This disinfectant should not be stronger than one teaspoonful to one pint of water.

The use of teat plugs or other instruments should be avoided as they frequently serve to spread the infection rather than to cure the animal. Whenever you are working around a cow that has this disease, be sure to disinfect the hands before milking a healthy cow.

How to Treat Garget

To successfully treat garget, the disease must be recognized at the earliest possible moment. Any animal that gives thick milk, that has hard lumps in the udder, or has an inflamed udder, other than just after calving, should be suspected of garget. As already suggested, if possible, the cow should be moved away from the rest of the herd and milked only after the other cows have been milked. Do not milk the diseased quarter on the floor, but milk it into a pail and dispose of the milk where it cannot by any chance infect healthy animals.

It is advisable to reduce the amount of grain given. The State College of Agriculture suggests cutting out all of the grain ration for a day or a day and a half, and not to put the cow back on full feed until she has fully recovered. Since any milk produced by an infected quarter contains millions of bacteria, it naturally follows that it helps to draw the milk frequently; in fact, any cow infected with garget should be milked several times each day. It generally helps to give the cow a laxative of one or one and one-half pounds of Epsom Salts.

It is also a good plan to rub the udder with hot water or some grease, such as camphorated oil. Where grease is used, it should be understood that it is the rubbing that helps rather than the grease.

There is only one cause of garget, namely, a particular type of bacteria. At the same time, there are a number of things that may help to make conditions favorable for garget. Heavy feeding, bruises, lying on cold floors or irregular milking may help weaken an animal's resistance so that garget gets a foothold, but none of these conditions actually cause the disease.

Good Pastures Mean Economical Milk Production

(Continued from Page 3)

pasture months of July and August. The intensive dairy regions of New York are closely related to the distribution of this important pasture plant.

Creeping Bent Grass grows well on wet soils which are not too acid. This plant often produces excellent pasture in swampy areas. It makes its most rapid growth during midsummer and it makes a fine supplement to the early Kentucky blue grass pastures.

Poverty Grass, Sweet Vernal Grass and Trees are apt to encroach upon runout or depleted pasture soils. Where the fertility level is maintained many of these plants can not compete with the more desirable pasture plants.

Pasture Needed All Summer

One of the important requirements for a successful dairy industry in this region is an adequate continuous supply of pasturage throughout the entire pasture season. Even a short period of low pasturage due to dry or hot weather may be a determining factor in the success or failure of a dairy farm. The intensive dairy regions of New York are fortunate in having a combination of pasture plants which may supply relatively good pasture throughout the entire season. The pasturage supply, so far as the permanent pasture plants are concerned, may be roughly divided in three periods as follows: first, the early season period when Kentucky blue grass and white clover grow rapidly; second, the midsummer season period when Rhode Island bent grass and creeping bent grass supply abundant pasturage; and third, the late summer and fall period, when Kentucky blue grass and white clover grow rapidly again.

The early fall pasturage can be very greatly improved by suitable fertilization of Kentucky blue grass and white clover pastures. Late summer and early fall seems to be the period of critical milk production in this section. The fertilization and the proper management of Kentucky blue grass and white clover pastures will go a long way toward meeting the milk shortage during the fall months.

Good Pasture Needs Fertile Soil

Farmers generally realize the relation between the virgin timber trees and the cropping value of land. Natural vegetation is an expression of both soil and climatic conditions and provides a good basis for judging the quality of land for various agricultural purposes. Land covered with hickories, white oak, ash, or hard maple is apt to be much more productive and valuable for pasturage than land covered with beech, birch, soft maple, hemlock or pine. When the timber is removed from a soil there is a more or less definite succession of types of pasture vegetation. Newly cleared land usually contains sufficient fertility for the successful growth of plants such as Kentucky blue grass which requires a relatively high fertility level. As the soil fertility is lowered, blue grass is followed by Rhode Island bent grass where the rainfall is sufficient or by red top in the dryer regions. As the fertility is still further decreased poverty grass, weeds, and trees encroach upon the pasture. The length of time that any particular piece of soil will produce profitable pasturage will depend upon the inherent fertility of the soil.

Fertilization of Permanent Pastures

Experiments indicate that large returns can be expected from time and money invested in the proper fertilization and management of inherently good pasture soils. Much of the pasture land used in the past is not suitable for fertilization. After the natural fertility of these soils has been utilized for pasturage the soils should be permitted to go back to forest. They are usually in a satisfactory fertility state to grow very successful crops of pine timber or other trees tolerant of rela-

Reviewing the Latest Eastern Markets

Milk Prices

The following are the Sept. prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
3 Soft Cheese	2.51	
3 Evap. Cond. Milk Powder		
4 Hard Cheese	2.25	2.02
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for September 1928 was 3.42 for 3.5% milk and Sheffield's 3.17 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Recovers Lost Ground

CREAMERY SALTED	Aug. 23, 1929	Last Year
Higher than extra	43 1/2-44	49 -49 1/2
Extra (92sc)	43 -	48 1/2 -
U-91 score	38 1/2-42 1/2	44 -48
Lower G'ds	37 1/2-38	42 -43 1/2

Although last minute prices are not available as we go to press, it is very evident that the butter market is vastly improved over last week. At this writing creamery extras (92 score butter) are bringing 43 1/2c to 43 3/4c per pound. Last week we reported that although the market had lost in price, it had gained in strength. The undertone of firmness has continued and finally become so pronounced that the 1/2c loss in price was not only recovered but quotations advanced another 1/4c particularly on top grades.

There were those in the trade who argued strongly against an advance, they holding that it would be to the advantage of all concerned to keep butter moving more rapidly into distributing channels. However, the buying force was so pronounced that the market was bid up in spite of the opposition. Buying has been heavy on the part of chain stores and jobbers, anticipating larger consumptive requirements after Labor Day. However, the increased strength of the butter market throughout the country also had its effect and the big buyers have been inclined to carry heavier stocks.

We are beginning to feel the effects of the late July and early August dry spell in the form of somewhat lighter receipts, especially of fine butter. The recent change may check that shrinkage. However, even though the supplies do become

lighter we still have an enormous amount of butter in storage.

Cheese Trends Upward

STATE FLATS	Aug. 23, 1929	Last Year
Fresh Fanyo	23 -25	25 1/2 -25
Fresh Av'ge		
Held Fanyo	27 1/2-29 1/2	
Held Av'ge		

The fact that the higher grades of fresh cheese are held with greater firmness leads to the belief that higher prices will soon be realized on the better marks of freshly made cheese. This opinion is strengthened further by the fact that replacement costs in the country average a little higher and already asking prices in some stores have been advanced slightly. At this writing quotations are the same as they were last week. However, if the present trend continues we expect to see higher quotations next week. The West is offering cheese very conservatively and with comparatively few fresh State cheese coming forward, the outlook is for a higher market.

Higher Prices Slow Up Egg Sales

NEARBY WHITE	Aug. 23, 1929	Last Year
Hennery	50 -54	50-53
Selected Extras	48 -49	46-49
Average Extras	40 -46	40-44
Extra Firsts	36 -39	35-37
Firsts	34 -35	33-34
Undergrades	33 -40	31-35
Pullets	23 -30	28-30
Pewees		43-47
NEARBY BROWNS		
Hennery	45 -51	
Gathered	35 1/2-44	32-42

As we go to press closing prices in the egg market for the week ending August 30 are not available. At the writing closely selected extras are bringing from 51c to 56c. All lines and classifications show an advance over the last week, both browns and whites. The higher prices apparently are beginning to have some effect on the buying public. Most dealers report some reduction in current demand for eggs following the latest advances in retail prices. Furthermore, the cooler weather is permitting a freer use of storage eggs and many jobbers are working on their holdings. An easier undertone exists throughout the entire egg market, Pacific Coast whites feeling the reaction as fully as nearbys.

With the higher existing prices buyers are extremely critical and unless eggs show good interior quality, no matter how they are graded for size and color, they are passed up. Some nearbys are bringing as much as 58 cents a dozen, but those eggs are superfine, being 100% new laid and graded to perfection.

Too Much Freight Poultry Hurts Market

FOWLS	Aug. 23, 1929	Last Year
Colored	29-31	27-30
Leghorn	21-26	20-24
CHICKENS

DUCKS, Nearby	22-26	22-26
GESE		

If all the cars arrive that are posted for this week (August 31) we are going to have more live poultry than the market can absorb. The heavy postings have thrown a scare into the trade and the market is off balance. There is a rather firm undertone in the market for a good distributing business is looked for. However, the heavy postings of cars already in, and available during the balance of the week, offer quite an impediment to any advance.

Express fowls are a little cheaper than they were last week. The freight market had its effect there. Express broilers are also below quotations of a week ago. The demand for broilers is only fair, not having the snap we would like to see. If some of the freight cars are held off the market we are going to see a reversal of conditions with consequently higher prices.

Next week we look for a better live poultry market. There will be a heavy return of city folks from summer resorts and there will be an improved demand for live poultry. If prices do not improve, at least they are expected to hold steady and the heavy accumulations will be disposed of.

Rabbits are quiet at from 24 to 26 cents.

Potato Market Quiet

The potato market has quieted down during the last few days, there having been less active buying. Long Islands are barely steady, although 150 lb. sacks

still continue at \$5.00. The 55 lb. sacks are easier and lower. Maines in bulk are bringing from \$4.75 to \$5.00 per 180 lbs., while 150 lb. sacks are bringing from \$4.25 to \$4.50. Jerseys are rapidly clearing up with the best bringing \$4.75. A car of Idaho was received during the week, but the stock shows undersize and is slightly green, therefore meeting a very limited outlet. The Idaho goods are generally from \$4.25 to \$4.50 per 100 lb. sack.

PLUMS:—HUDSON VALLEY: Damson, per 12 quart climax basket, mostly \$1.25; per four quart basket 25-50c. Two quart baskets 20-25c.

CAULIFLOWER:—CATSKILL MOUNTAIN AREA: per crate, No. 1's \$2.25-\$3.50, mostly \$2.75-\$3.25; some strictly fancy \$3.75; No. 2's \$1.25-\$2.00. ERIE COUNTY: no arrivals.

CABBAGE:—WESTERN NEW YORK: white domestic, per sack of about 90 pounds \$2.25-\$2.50. Virginia white, per crate of about 100 pounds \$3.00-\$3.25.

CARROTS:—WESTERN NEW YORK SECTIONS, ORANGE AND OSWEGO COUNTIES: per bushel hamper, cut stock 75c-\$1.12 1/2; washed \$1.25-\$1.50.

CELERY:—ORANGE COUNTY: per bunch of 12 stalks 25c-75c, depending upon size and quality. Stock in the rough, wide range pack, size, quality and condition, per two-thirds crate \$1.50-\$2.25, some poor as low as \$1.00; half crate 75c-\$1.75, mostly \$1.00-\$1.50, some extra fancy \$2.00; quarter crate 75c-\$1.25, mostly \$1.00. High Ball crate \$1.00-\$1.25. OSWEGO COUNTY AND WESTERN NEW YORK: stock in the rough, per two-thirds crate \$1.75-\$2.25, mostly \$2.00-\$2.25.

CUCUMBERS:—WESTERN NEW YORK AND OSWEGO COUNTY: per bushel basket, wide range quality and pack No. 1's \$2.00-\$2.50, extra fancy \$2.75. Knobs and No. 2's 75c-\$1.50; dills \$2.00-

3.00, mostly \$2.25-\$2.75, stock in poor condition 75c-\$1.25; pickles \$2.50-\$3.25, stock in poor condition 75c-\$1.25. ALBANY COUNTY: per bushel basket, cucumbers, extra fancy \$2.50-\$3.00.

LETTUCE:—Big Boston, per crate of 24 heads, Western New York sections 25-50c, few 60-65c, poor low 10c. Oswego and Madison Counties 25-65c, mostly 40-60c, few strictly fancy lots around 75c.

ONIONS:—ORANGE COUNTY: jobbing store sales, per 50 pound bag, yellow \$1.00-\$1.15; white boilers mostly \$1.25; picklers \$2.25-\$3.00; sacks of 100 pounds, yellows \$1.75-\$2.40, mostly \$2.00-\$2.35, red mostly \$2.25. Pier sales, Madison County, carlot sales, per 100 pound sack \$2.00, delivered; 50 pound sack \$1.00, delivered.

SQUASH:—OSWEGO COUNTY: per bushel basket, yellow crooked neck 50-75c; white 50-75c.

TOMATOES:—HUDSON VALLEY: various varieties, per carrier of six four-quart baskets, best, \$1.75-\$2.50, ordinary to poor \$1.00-\$1.50; per 12 quart climax basket 35-75c. WESTERN NEW YORK: per carrier of six four quart baskets, fancy pack 144 tomatoes \$1.50-\$1.62 1/2; choice pack 180 tomatoes mostly \$1.12 1/2.

TURNIPS:—WESTERN NEW YORK: per bushel basket, \$1.50-\$2.50. (White purple top).

A Trip to the Corn Belt

(Continued from Page 6)

here this year. Everywhere one sees excellent stands, with many good second crops in full bloom. The seed crop ought to be a good one this year also. The feeders will have better roughage. I have been somewhat surprised to note so little alfalfa in these states. One sees occasional fields which generally look good, but the crop is not at all common.

Buildings Poorer Than In East

Another observation which has impressed me about this corn belt area is the farm homes and farmsteads. In general they are not as good as ours in the East. The houses are small and poor and the buildings are less extensive than ours. This is probably the result of the large proportion of tenants and the type of farming. Many successful farm owners of from one to half a dozen farms live in the towns. Of course one does see splendid farms and farmsteads here and there, and occasionally in whole sections. Highway building has progressed enormously since I was here before, several years ago. Especially are the main roads between the towns, which are generally of concrete, straight and graded, but the farm graveled roads are much better kept than previously. —M. C. BURRITT, Peoria, Ill.

FARQUHAR POTATO DIGGERS

INCREASE PROFITS

The Farquhar Elevator Digger contains a modern device for rapid, clean digging. Puts the potatoes in a neat compact row, ready for easiest and quickest handling. They have been proven right by the hardest kind of field operation.

The Farquhar is the original rigid tongue digger—can be backed, held over the row when digging on hillside—and is light of draft. Built with broad front roller or two wheel front truck. May be equipped with level or hillside cleats; also road run.

We also build the "Success Junior," the plow type digger for the smaller grower—the average farmer's choice. Illustrated Catalog sent to any grower.

When Writing Advertisers, Be Sure to Mention American Agriculturist

John D. Lewer, Waseca, Minn., R. F. D. No. 2, prominent farmer and stock raiser, member Minnesota state legislature, writes, "Have used Goodyear Tires for a number of years to my complete satisfaction, and know they are the best tires on the market today."

We think the reason that Goodyear Tires outsell any other kind is that Goodyears give the user more for his money.

This greater value is not a supposition; it is real.

There are just two main parts to a tire—the *tread* and the *carcass*.

There are definite reasons why Goodyear Tires are superior in *both* these two main parts.

These reasons can be demonstrated and proved:

1

Press your hand down on the Goodyear All-Weather Tread. Feel the *grip* of the deep-cut sharp-edged blocks, placed in the *center* of the tread, where they belong.

That shows why the Goodyear Tread imprints its safe and slipless pattern on the road, and why it has superior traction.

Ask any Goodyear Dealer to show you on his cord-testing machine the greater stretch—up to 60%—in Goodyear Supertwist Cord over standard cord.

This extra stretch gives the Goodyear Supertwist Carcass its unmatched vitality, enabling it to withstand road-shocks and continuous flexing without premature failure.

Here are advantages in Goodyear Tires you ought to be enjoying, and *you can enjoy them at no extra cost.*

The proof of their importance comes right back to the biggest fact in the tire business:

"MORE PEOPLE RIDE ON GOODYEAR TIRES THAN ON ANY OTHER KIND!"

In less than eight months, over a
MILLION
Six-Cylinder Chevrolets on the road!

Since January first, the Chevrolet Six has enjoyed the most tremendous nationwide approval ever accorded to a new motor car in such a short period of time—already a million on the road! And the reasons for this overwhelming success are easy to understand—once you stop to consider the facts!

The Chevrolet Six actually sells in the price range of the four, yet it provides all the advantages of

six-cylinder performance. It offers the superiority in style, luxury and comfort of Bodies by Fisher—available in a variety of colors. Its dependability and great reserve power enable it to master the most extreme conditions of severe service. And it operates with an economy of better than 20 miles to the gallon!

See and drive this remarkable six which has already been the choice of over a million buyers!

**CHEVROLET
 SIX**

Six-Cylinder Smoothness

The inherent balance of six-cylinder, valve-in-head design assures, at every speed, the smooth, velvety flow of power that distinguishes the fine automobile.

Six-Cylinder Acceleration

A non-detonating, high-compression cylinder head and automatic acceleration pump give the new Chevrolet Six remarkable acceleration.

Six-Cylinder Power

No hill is so steep or no road so difficult that the new Chevrolet Six does not easily "come through" with an abundance of reserve power still at your command.

**Better than 20 Miles
 to the Gallon**

Chevrolet engineers spent years of research and development to perfect a six-cylinder motor that delivers better than twenty miles to the gallon of gasoline.

Beautiful Fisher Bodies

Rare beauty, smartness and comfort are provided in the Bodies by Fisher. Composite hardwood and steel construction gives them unusual strength and safety.

Remarkable Handling Ease

A full ball bearing steering mechanism, a remarkably easy gear-shift, and powerful, non-locking, four-wheel brakes enable you to drive the Chevrolet Six for hours without the slightest fatigue.

Every Modern Convenience

—including twin-beam, foot-controlled headlamps; adjustable driver's seat and VV windshield in all enclosed models; and a completely equipped instrument panel with electric motor temperature indicator and theft-proof Electrolock.

Enduring Quality

Due to the vast combined resources of Chevrolet and General Motors, the Chevrolet Six is built to exceptionally rigid standards of precision, using only the highest quality materials.

Farm News from New York

Governor Roosevelt Sends Open Letter To Rural Taxpayers

GOVERNOR ROOSEVELT has addressed a letter to the taxpayers of each of the upstate counties in which he cites the savings to each county as a result of the state farm relief or tax revision program enacted into law last spring. The letter points out that a total saving to the upstate counties of \$4,714,360 has been made on highway construction this year and that \$571,435 has been saved them on highway maintenance. In addition to this is a saving of \$12,666,291 through the elimination of the direct state tax on real estate.

This saving to the counties results from the assumption by the State of costs which have hitherto been borne by the counties, plus the elimination of the direct state tax on real estate. Governor Roosevelt points out that this saving should be reflected back to the taxpayers, but that it may not be passed on to them if boards of supervisors increase local expenditures for other purposes. The Governor urges taxpayers to take an increased interest in local expenditures, especially as to how this very substantial saving will be used in each county this year and in years to come.

Following is Governor Roosevelt's letter as sent to taxpayers in Sullivan County:

"State of New York, Executive Chamber, Albany.

"To the taxpayers of Sullivan County:

"Because they have such a direct bearing on county and local taxes and expenditures, and so vitally affect your tax bills, I venture to present some simple figures showing what the new legislation, generally known as the Farm Relief program, has accomplished for you.

"A new law enacted this year relieves your and other counties from contributing 35 per cent of the cost of completing the state highway system. This saves your county this year \$154,805, and in ten years it will save you \$2,266,000.

Further Relief is Cited

"Another new law relieves the towns and villages from contributing toward the upkeep of improved highways in the state highway system. That saves this year to taxpayers in Sullivan County towns and villages \$7,475. This will be a continued yearly saving.

"The direct state tax on property was eliminated this year. Measured by last year's direct state tax, that saves you \$35,828.

"Two other laws were enacted this year which will give tax relief to all Sullivan County taxpayers, but I am unable at the present moment to express in dollars and cents the benefits accruing to Sullivan County. They will, however, be sizable. One of these laws equalizes the burden of school taxes and gives relief on a state-wide basis of about \$3,000,000 a year. The other reduces from 10 per cent to 1 per cent the counties' share of the cost of grade-crossing eliminations. This will save, on a state-wide basis, \$2,801,133 this year.

"In other words, it is now known that the farm relief program which was in effect a rural tax relief program, will save to Sullivan County taxpayers this year \$198,108, plus sizable amounts for rural schools and an uncertain amount for grade-crossings elimination. This yearly saving will continue in succeeding years.

First Step Pointed Out

"This is the first step and a very definite one, as I am sure you will agree. I am vitally interested in seeing this tax relief passed along to you. Whether or not you receive the full benefit depends upon your Board of Supervisors and other local officials. If this benefit is passed on, your taxes should be materially lowered. If, on the other hand, the Board of Supervisors and town and village officials increase local expenditures for other purposes, a considerable portion or the whole of this saving may disappear.

"In the final analysis, the great majority of your taxes go not into the state treasury but for local expenditures, and I

am sending this letter to the taxpayers of Sullivan County with the hope they will take an increased interest in their local expenditures and, especially, in the decision reached by your local governing bodies as to how this very substantial saving will be used in your county in this and succeeding years.

"Respectfully yours,

"FRANKLIN D. ROOSEVELT."

The aggregate saving on highway construction and maintenance through elimination of the direct state tax as reported by the Governor by counties was as follows:

Albany, \$179,978.
Allegheny, \$200,236.
Broome, \$267,914.
Cattaraugus, \$195,829.
Cayuga, \$200,988.

Southern Tier Notes

MINOS HAROUTUNIAN, a 55-year-old farmer living near Tunnel, Broome County, was attacked by a bull August 21st, and trampled to death. No one witnessed the event. Later the bull charged on Aram, a son, who probably would have shared the same fate if a neighbor had not shot the animal dead before it reached the young man.

A re-union of former teachers and pupils of Mt. Ettrick school is being held August 23rd in the old schoolhouse. Mrs. Jennie S. Vincent, 78, is probably the oldest teacher now living. She taught her first term in the home district when 17 years old.

The new highway along the Susquehanna River west of Johnson City, cutting off traffic by the way of Gray's crossing, is practically finished, lacking only railings. Gray's crossing has been one of the most dangerous in this part of the country.

William Preston has completed setting out an apple orchard of 700 trees a short distance west of West Endicott.

The Susquehanna River at Binghamton has reached a low water stage of 1.9 feet. Crops in this vicinity, however, have been normally good. Hay was a good crop, corn is coming on well and potatoes are coming into market of good size and bringing about \$2.00 a bushel.

Eggs are worth 37 cents a dozen on the Endicott-Johnson market.

Plenty of sweet corn, blackberries and some strawberries are still to be found in Binghamton and neighboring markets.—E. L. V.

Pennsylvania Potato Growers Meet at State College

APPROXIMATELY six thousand visitors from Pennsylvania and other states attended a potato exposition at the Pennsylvania State College August 19 to 22. In addition to talks by prominent authorities including Dr. E. L. Nixon of the College, Dr. W. J. Spillman of the U. S. Department of Agriculture, Dr. C. G. Jordan, Secretary of the State Department of Agriculture, there was an extensive exhibit of machinery, lime, insecticides, fungicides, diseases, insects, potato varieties, storage methods, etc. Field demonstrations also held an important place in the program and those attending saw actual deep tillage implements, harrows, cultivators, tractors and other potato growing machinery at work in the field. On Tuesday evening there was a business meeting of the Pennsylvania Potato Growers' Association, followed by an entertaining program and on Wednesday evening Strickland Gillilan of Washington, D. C., gave an amusing lecture.

A Ride Through Delaware County

A RIDE from the Susquehanna Valley to the Delaware in the middle of August gives one a pretty good idea of the situation and the season in this section. It is quite a while since I have made a similar journey and since then some road-making has been in progress. My first impression is one of surprise that one can negotiate those Delaware hills at so easy a grade. We soon strike Carr's Creek, near where

the early settler by that name had his grist mill, and it is but little trouble to drop over into the valley of West Brook and down to old Walton Village with its historic setting, where the Townsends and Norths and others settled about 1785. We are giving more attention to local history than we used to do. This is right, too, for New England has long surpassed us in this respect. We even passed the marker at the mouth of the Unadilla River, just set up to show where General Clinton's army encamped August 12, 1789 while on its way to join General Sullivan on his famous march.

But what about crops? It is getting pretty dry up-State and streams are low: some say the lowest they ever knew. I have known springs on the old farm to be even lower than now, however. Occasionally, a belated haymaker is still gathering in the staple, but it is brown and looks like poor stuff. There is a lot of very good hay in most barns, though. A few, a very few, are cutting a second crop of clover. I saw one field of clover all in blossom. It looked like old times, only the growth was rather short and too dry. There are several stacks of hay to be seen, but the hay crop in general, though good, is not up to that of last year in quantity, but I believe the quality is higher.

There are some evidences of attempts to change farming a little, but they are not likely to down the dairy business in these parts. A few try cauliflower, but on this trip not much of it is seen. One man has a thrifty looking half acre of asparagus but such enterprises are for the few. I did not see many potato fields and these few did not look especially promising. Even cabbage shows less acreage than has been usual of late years. No, we are all staying pretty close to the dairy cow, and there are many evidences of a mild prosperity, due to especial thrift and effort, as I figure it.—H. H. LYON.

Clark **IMPORTANT** ANNOUNCEMENT

Get This 3 Year Guarantee
IT COSTS NO MORE

The disks on every Clark "Cutaway" Harrow are unconditionally guaranteed for 3 years against breaking, cracking or any other defect which renders the disks unfit for use.

This means that the disks on all harrows bought after September 1st will be replaced FREE OF CHARGE if they become unfit for good work within 3 years from the date of purchase. A written guarantee goes with every harrow.

There are no "ifs" or "buts" in the Clark "Cutaway" guarantee. The purchaser is the judge.

Buy the harrow, use it in any kind of soil and if any disk is damaged so its usefulness for good service is over, send it back to us. We'll give you a new one FREE.

This is a liberal guarantee and we are the first and only manufacturers to offer it. But we can do it for there are in service today Clark "Cutaway" Harrows and Plows that were bought 10, 15, 25, and 30 years ago. And they still have the ORIGINAL disks.

Tested! By 10 generations of Layers

It's a rare quality Mash that can meet the needs of 10 generations of hens. Yet Beacon, starting with quality 10 years ago, has steadily improved, and has built up a reputation for results without equal throughout the northeastern States.

Reasons—Contains all needed Green Food (finest irrigated Alfalfa Leaf Meal) Concentrated cod liver oil (Columbia Univ. patents) insuring uniform source of Vitamin D in purest form; balanced minerals, variety of protein (21%), dried buttermilk, skim milk, Proteolyse. Low, small-town overhead and loyal workers permit more quality per dollar.

Test it yourself. Let your hens decide. Test it pen for pen, bird for bird. Test it by cost per dozen eggs, by body building results, by larger eggs. Test Beacon ANY WAY and prove Beacon best.

BEACON MILLING CO. CAYUGA, N. Y.

New York Vegetable Growers Win

(Continued from Page 2)

the Starkey Farms Co. who operate about 1200 acres on land once owned by William Penn.

Interesting Talks Heard

The program included many interesting addresses. Byron Roberts of Moorestown, New Jersey, protested in no equivocal terms against the reclamation of land in the Far West which bears no interest and competes with lands enjoying no subsidy whatever. The Robertses find that vegetables such as spinach, carrots, beets, radishes and beans fit in very well with their orchard operations and enable them to use Italian help throughout a long season each year.

Walter Marion of Circleville, Ohio, told how he makes money growing early tomatoes on stakes. The crop grows on early cabbage ground of the previous year, green manure crops of soy beans and then rye filling the time till winter. Fall plowing is practiced and the land is kept in good shape until the plants are set about May 10. Good grade cypress stakes are used at a cost of around \$60 a thousand. They last ten to fifteen years. Plants are trimmed to a single stem and are tied several times with jute twine. Care is taken to remove all mishapen fruits when small. Fertilizer is liberally applied both before and after setting and the crop usually begins to ripen about the first of July. Fruits are picked daily, three days ahead of ripe and packed in splint baskets carrying ten pounds in two layers. Glazed paper lining and a printed pasteboard cover are used.

The Value of Green Manure Crops

J. W. White of Penn State, gave a vivid picture of the value of green manure crops for addition of humus for nitrogen fixation and for conserving soil nutrients. A sweet clover crop of six tons per acre, green weight, is not especially heavy but it conserves or gathers 138 pounds of nitrogen equal to six times that much nitrate of soda.

V. H. Boswell told in detail of the new "National Type Book" project which the U. S. Bureau of Plant Industry has established in collaboration with several of the experiment stations

for the purpose of preparing adequate descriptions of vegetable varieties. No coercive measures of any sort are planned but it is expected that the existence of authentic standards will lead the improvers to seek wider differences and will tend to bring the old varieties into conformity.

A. G. Waller of the New Jersey Experiment Station, reported on comprehensive surveys of the vegetable business in that state. Twenty per cent of Jersey's improved land is under vegetables and these crops are responsible for around a third of the state's agricultural production value. Market gardens surveyed during two seasons showed about 20 acres of crops with gross returns of around \$420 per acre. This looks great—but hold a moment. The average labor cost is \$170 per acre, the fertilizer bill is \$60, the land is worth an average of \$1200 per acre, and there are plenty of other costs to make the profits precarious while the risks are heavy. Waller gave tomato figures which show the necessity for high yields. In 1927 on farms surveyed the average yield was 395 crates at a cost of 48c per crate and with returns of 84c per crate. The corresponding figures for 1928 were 188 crates, 90c cost, and 80c gross return.

Growing Early Plants

J. E. Knott of Penn State, compared results with different types of containers for growing early plants. Some difficulty has been experienced with vessels of organic material, chiefly due to the nitrogen consumption by the bacteria which are engaged in breaking down the peat or paper as the case may be. The judicious use of nitrate serves to counteract this trouble. Acidity of peat pots may also be troublesome and may be corrected by soaking in lime water.

Beside Henry Marquart, other officers were elected as follows: Vice-President, J. H. Budzien, Milwaukee; Secretary, Frank Held, Columbus; Treasurer, H. J. Cheney, Grand Rapids; Directors, H. F. Tompson, Attleboro, Mass.; A. P. Morris, Crawfordsville, Ind. The next meeting is to be held in Milwaukee; An extensive trade show afforded opportunity to meet factory representatives and to compare products.

Good Pastures Mean Economical Fruit Production

(Continued from Page 9)

tively low fertility levels. Many farmers make the mistake of cutting pine trees which encroach upon the pastures. The cutting of such trees does not restore the productivity of the pasture, because the fertility level is too low for the successful growth of desirable pasture plants. Pine trees ordinarily do not encroach upon good grass pastures.

Where the soils are fertilized the carrying capacity of the pasture will be greatly increased and the acreage of the pasture can be very materially reduced. One of the first essentials in the successful management of pasture land is to decide whether a given piece of soil is suitable for fertilization and what kind of fertilizer should be used. Most of the soils in this section are deficient in available phosphorous and many are deficient in lime and available nitrogen and potash. The kinds and amounts of fertilizers to use will largely depend upon the soil and the type of pasture plants desired in a given pasture. County agricultural agents and the State Experiment Stations have available suggested fertilizer treatments for various conditions.

Most of the desirable pasture plants respond to liberal amounts of phosphorous, lime, potash and nitrogen. The recent production of the concentrated synthetic fertilizer makes it relatively easy to apply plant food materials to pastures.

The mineral content of pasture plants is greatly influenced by the fertility of the soil. Some of the most nutritious pasture grasses, like Kentucky blue grass requires a high fertility level for their successful growth, therefore, they are usually soft, palatable and nu-

tritious. They succeed only on soil well supplied with the relatively soft elements such as potash, calcium and phosphorous, which influence palatability. When pastures are fertilized the animals always graze the fertilized areas more closely. One of the most economical and effective means of increasing and maintaining our dairy products and meeting the critical milk shortage period in the fall months is the intelligent fertilization of our pastures.

It is up to the dairy farmers in the Northeastern States to utilize their natural advantages such as a favorable-pasture climate, a superior combination of possible desirable pasture plants and a ready market, otherwise they can not hope to compete with regions which do capitalize their particular natural advantages.

Watch Out for Lead Poisoning in Young Stock

YOUNG animals, particularly calves, have a habit of licking everything. Many valuable calves have been lost because of lead poison obtained through licking painted surfaces.

There is danger in a freshly painted wall or from an old paint container in a yard or pasture. Sometimes calves get slow lead poisoning and gradually get sick and die without the owner being able to tell what the matter is. This often happens when the calf continually licks old dried paint. Once the calf gets the poison in his system, there is not much that can be done.

Post Your Farm And Keep Trespassers Off

We have had some new signs made up of extra heavy material because severe storms will tear and otherwise make useless a lighter constructed material. We unreservedly advise farmers to post their land and the notices we have prepared comply in all respects with the laws of New York, New Jersey and Pennsylvania. The price to subscribers is 95 cents a dozen, the same rate applying to larger quantities. Remittance must accompany order.

... a book of interest to every farmer

THE modern farmer has almost countless uses for concrete because of its permanence, economy and ease of application to all kinds of building.

The new booklet, "Permanent Farm Construction," is a practical working manual on farm concrete. It tells how to use concrete for barns, granaries, silos, septic tanks, and every structure required on the modern farm. Detailed suggestions for mixing and placing concrete are given, together with a large number of useful photographs and diagrams.

To Kill Poultry Lice - Just Paint it on the Roosts!

No matter how big the flock or how lousy, only a small paint brush and a can of "Black Leaf 40" are needed to rid a flock of lice.

Does Away With Individual Handling
Old laborious and disagreeable methods of dusting, dipping or greasing are eliminated. No longer necessary to disturb the birds.

Treat Whole Flock in a Few Minutes
Simply "paint" "Black Leaf 40" on top of roosts. When birds go to roost, fumes are slowly released, penetrating the feathers and killing the lice. "Black Leaf 40" is sold by poultry supply dealers, druggists, hardware and seed stores, etc. The \$1.25 size treats 100 feet of roost. Ask your dealer.

POULTRY FARMER

Chicken Pox Can Be Prevented

EVERYONE knows what vaccination is. Almost everyone has been vaccinated. The reason—to prevent disease. Naturally and logically the question was raised, can we not vaccinate our farm animals to prevent disease? And now it is being done with excellent results, particularly in preventing hog cholera.

Attempts to prevent various poultry diseases have not been entirely satisfactory until recently. Sometimes surprisingly quick and effective results followed vaccination, but more often there was no benefit. The practice has therefore never been recommended or followed to any extent.

In the case of chicken pox or "fowl pox" at least, the doctors and experimentalists have found out why results were not always as we would like, and as a result have worked out a new method of vaccination that is giving positive results. It is removing one great source of worry from the minds of hundreds of poultrymen who have had experiences with chicken pox that they do not want repeated.

How To Recognize the Disease

Fortunately there are many poultrymen who do not know what chicken pox is. They have never seen it. A brief description of the disease and its results may therefore be in order. Fowl pox is also called avian diphtheria because the same virus causes both forms of disease. As a rule small yellowish eruptions appear on the comb, wattles and face of the bird. These spots soon turn into dark wart-like scales and become noticeable. If no other complications set in the bird usually is sick for only a few days during which time she is inactive, does not eat, loses weight and ceases to lay. Eventually the scales dry up and drop off and the bird recovers, but it takes a long time to regain weight and resume production. Molting often follows. It is bad enough to lose the bird's production but to lose the bird as well is worse. This often happens when complications do set in. The disease usually strikes in the late fall and early winter. In their weakened condition the birds become easy victims of colds, cankers and roup. Heavy mortality in the flock results.

In the diphtheretic form of the disease the scabs are soft yellow masses in the mouth and throat. Suffocation often occurs.

The disease is spread from one bird to another by contact and by infected coops. The virus can live a long time in the dried scales. Birds that have gone through an outbreak as pullets are usually immune and will not take the disease again. An outbreak the following fall among the new crop of pullets may almost be taken as a matter of course.

The growing pullet, before she starts laying, seems resistant to the disease; but after she starts laying her resistance breaks down to some extent. It is on this fact that the new method is based.

How Hens Are Vaccinated

A few feathers are pulled out on the leg and a small amount of vaccine applied to the openings left in the skin. A camels-hair brush is used. In about ten days a small scab has formed and in twenty days more it has fallen off. No ill-effects can be observed in the

Now is the time to put your birds on OATMEAL FEEDS!

EVERY condition in poultry raising suggests that right now is the time to put your birds on scientific oatmeal feeds.

For example, your late-hatched fowl need oatmeal to catch up with the season. Oatmeal brings swift growth and fortifies the chicken against unfavorable weather. So, keep Quaker Ful-O-Pep Growing Mash before the youngsters—it contains pure, fresh oatmeal.

Then, take your pullets: they want oatmeal, too, in order to develop into regular, high-production layers. Give them Quaker Ful-O-Pep Egg Mash, the famous oatmeal ration that enables young hens to lay lots of full-size, marketable eggs. This mash contains oatmeal and other essential ingredients for maximum production—cod liver meal, molasses in dry form, minerals, proteins—all in convenient form. It costs less because it does more.

And for molting birds: ask your Quaker dealer about the Quaker "fifty-fifty" method of feeding Growing Mash and Egg Mash. These feeds build new feathers, new vigor, renewing the birds' capacity for work.

All conditions this year suggest that you turn to the proved Quaker method of providing these complete oatmeal feeds for your flocks. Just ask your Quaker Dealer how easily and economically this can be done, or drop us a note direct.

Quaker FUL-O-PEP EGG MASH

THE QUAKER OATS COMPANY, CHICAGO, U. S. A.

It May Have Been a Good Bedspring Once, But~

NOW its "spring" is gone. There's a valley in the center where there should be—support. It sinks and sags and groans beneath your weight and you pay the penalty with a sagging spine and sleep-starved nerves.

Why not a New Bedspring and why not a Good One? A Foster Ideal Spring is bound to give you better rest because its 120 finely tempered, upright, spiral springs assure you finer spine support, finer nerve relaxation and finer comfort. Here is an honest, open, sanitary spring designed from a thorough study of sleep. There's nothing better at any price.

Upholstery Springs ~ Upholstery Spring Constructions
and Inner Spring Mattress Fillings

Important

Foster Ideal Springs are not sold in every furniture or department store and you may be urged to buy something alleged to be "just as good or superior" to a Foster Ideal. But—if you are interested in proper spine support and want real rest, you'll seek out the Foster Ideal Dealer in your city and you'll buy a genuine Foster Ideal Spring, that bears the Foster Trade Mark.

The Bedspring That Supports Your Spine

Aunt Janet's Corner

Happiness Comes from Service

DEAR AUNT JANET: I was very much interested in the letter from "Rebellious" also the answer from the "Male Reader" and gave the matter quite a little thinking. I was again stirred to thinking along the same line by "Woman Reader", as I have been through "Rebellious" place and came out with flying colors, my husband, children, home, all safe and secure. I thought, like all girls do I suppose, when I married that I had about the best man on earth, but we learn many things.

One thing I learned was that my wonderful hubby was very close, or, that is, he chose to spend the money he took in. When we were first married I had lots of clothes and money in the bank. All went well enough until my money and clothes were nearly gone. Then I started in like "Rebellious" to cry and fret for my share of the income but crying did no good. Once when I wanted some sheets, rather than give me the money to buy what I wanted, he went to town and got some and paid two dollars apiece for them. They were nice, only larger and heavier than I wished. Another time I wanted money to buy clothes etc. to prepare for a coming baby. Did I get the money? Of course not. About two or three weeks before the baby came he brought home some canton flannel to make up while I wanted part wool flannel and nainsook or batiste and outing flannel. I had no machine and had to sew almost night and day to get things ready.

Still another time I wanted some tan silk for a good dress to match my hat and a light sweater I made do for my summer coat. Mr. Man came home with some bright red cotton broadcloth. Did I cry? Of course. Wouldn't

you have done so? But I found out crying didn't do any good. I tried this way and that but to no avail. Then we moved and we were close enough to a church so I could take my children and attend church and Sunday School but I thought "Oh dear, my clothes!" But finally did go and as I

used to do Sunday School work and they needed helpers (as it is a country church) I took part and there I found my old self and happiness.

It has been almost three years. We have been living with my husband's folks and although they tell him, as he used to do me, that half the income is his, he gets from fifty cents to a couple of dollars once in a while for gas if they want to go some place, and of

Youthful Smartness

2896

2923

Coat pattern No. 2896 is most attractive and youthful when made up in a patterned tweed. The military cape and unusual pocket arrangement are distinctive features of this pattern which cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Sizes 36 requires 5 yards of 39-inch material with 2 1-8 yards of 39-inch contrasting. Price 13c.

Jacket costume pattern No. 2923 can be made the standby for girls of 6, 8, 10, 12 and 14 years. Jacket and skirt of figured and blouse of plain material give a charming contrast. Figured pique or linen are good for early fall while wool jersey and flannel afford the warmth needed later. Size 8 requires 2 yards of 39-inch figured material with 1 3-8 yards of 39-inch plain material. Price 13c.

TO ORDER: Write name, address, pattern sizes and numbers clearly and correctly and enclose with correct remittance in stamps or coin (although coin is sent at own risk). Add 12c for one of the fall and winter fashion catalogues and send to Pattern Department, American Agriculturist, 461 Fourth Ave., New York City.

course, we eat and they buy clothes for us. All right with me, but Mr. Hubby who was used to doing his own buying just couldn't see through the idea and was talking it over with me one night. Here is where I got my kick. I asked him how he liked it. Then it dawned on him why I seemed displeased when he had brought home something which he thought wonderful. I felt sorry to see him trying each day to be a little more tender and whenever he did get money I got my share and sometimes all of it. He had learned his lesson and I had learned mine, for now I can have a wonderful time in my new but cheap cotton prints and light cotton hose or a two-year old silk dress. I have learned that true friends do not look at clothes. I have forgotten I was the best dressed girl in my class at high school and wanted to keep the name.

Now I like to hear some of them say when there is something going on at the church or Aid rooms, "We can depend on you." Still another says "I don't see how you take care of your children so well and help out so much." I guess they don't know that's my very life and I plan so I can help. So here is to Rebellious—find yourself and find some side interest somewhere; find that clothes are not all that count and in some way let your husband see himself as mine did.

AN UNDERSTANDING READER.

Ringworm Is Infectious

INFORMATION from the U. S. Public Health Service advises sufferers from ringworm to soak the affected parts in salt solution once every day. This is a usual treatment for infections in hospitals. Ringworm is very infect-

ious and anyone suffering from it in the hands should be very careful not to touch things other people touch. He should wear gloves when driving the car, should not dance, and should take extra precautions not to touch towels, bath clothes, soap or other articles used by others. Doornobs may be a common source of infection.

Lesions in the feet may cause the disease to spread if the sufferer walks barefoot on rugs or bathmats used by others. Ringworm is no respecter of

This very attractive pillow in modernistic style, No. C 2052 comes with design painted in non-fade, washable oil paint, on rayon silk taffeta. To finish the design all that is needed is to outline the painted sections with black embroidery floss, using the darning stitch. No. C 2052 comes stamped on rose colored silk rayon, enough material for top and back, price \$1.35. Order from Embroidery Department, American Agriculturist, 461 Fourth Ave., New York City.

persons, attacking both rich and poor, sick and well. It occurs in every part of the country but is more frequent in hot, moist weather. Hot floors, feet kept on hot radiators, or any condition keeping feet hot over a period of time predisposes to this disease.

Do You Know That—

The liquor from any canned fruit can be made into jelly, or used in jello instead of water? Chopped nuts can be stirred in when almost hard, (if you can eat them) or fruit.—MRS I. B., New York.

Spread newspapers over your kitchen table when dressing fish or cutting up poultry. Then when through, destroy the papers and your table is not soiled.

Use crumpled newspapers to wipe grease off plates and cooking utensils before putting them into the dishwasher, thereby doing away with that most disagreeable thing—greasy dishwasher.—N. M. F.

The Plains of Abraham—By James Oliver Curwood

In these moments the spirit of her father was with her again. This was the path he had loved best, over the hill and through the forest to the clearing in Forbidden Valley. His horse's feet had worn it smooth, and in the earth were hoofprints so clear and fresh he might have ridden it an hour ago. Close to Squirrel Rock he had always loitered to look over the grandeur of the valley, and there Toinette paused with Jeems, standing in the worn spot her father had made.

"They're down there," said Jeems, and pointed, speaking to Odd more than to her.

He took the hatchet from his belt and carried it in his hand. They crossed the open where he had killed Paul Tache, the turkey cock and passed through the screen of brush which the fairies had built. They entered the greater stillness of the Big Forest, and Odd, who had traveled between them, dropped back to Toinette's side and thrust his muzzle against her hand.

She did not snatch it away from him now.

They came to the slope, and Jeems forgot that Toinette was behind him. He walked straight down like a tall, thin ghost—and the girl stopped and stood alone, staring at the place where his home should have been, a cry wringing itself at last from her lips.

Jeems did not hear. He saw nothing but the clump of rose bushes and the place where his mother lay. He went to her first, oblivious of other presence, unconscious of the sun, of the ruins still smouldering, his soul stirring once more with the faint mad spark of incredulity. But she was dead. He saw her with clearer eyes, though he was sick with hurt. He knelt beside her calmly for a little while. He touched her face gently with his hand, and then went to his father. Odd trailed at his heels. In the stump field was a shovel, and they found it and bore it back with them together. Under his mother's big tree he planned to dig.

When he returned, his mother was not alone. Toinette was there, on the ground, with the English woman's head in her lap. Her eyes blazed up at Jeems, and something like defiance was in them, something that was possessive and challenging and which hid whatever pity she might have had for him, or pleading for his forgiveness. Her hands were pressing the cold face of the woman she had wanted to hate, and she continued to look at Jeems, so hard, so terribly, so understandingly that she seemed almost to be waiting for him to punish her with a blow.

Then she bowed her head over his mother, and the shining veil of her hair covered death.

Under the big tree he began to dig.

CHAPTER XII

IT WAS late afternoon when they left the valley, a still, slumbering hour when the sun was about to go to its early rest, leaving glows and sunset painting behind that might have been made of swimming metals.

Toinette's hand lay in Jeems's as they went.

They were like a young god and goddess ready to face the hazards of a savage world with a strength wrought out of fire. The sickness had left Jeems. His wounded arm was cared for by fingers as gentle as his mother's had been. Hot tears caressing his flesh from Toinette's dark lashes cured his physical pain. Words spoken in a voice he had never heard from her lips entreating his forgiveness for years of misunderstanding were like the peace of the day itself about his heart. Out of ruin she had raised his soul to splendid heights of courage and resolution. Seared by grief, but a grief

no greater than her own, he saw once more the ghosts of dreams.

Toinette, at his side, had gone back to the days when those dreams were in the making. He might have imagined her the Toinette of Lussan's place except that she was less than magnificent now, with her dress soiled and torn and her hair in a braid of straight tresses instead of lustrous curls. Under the big tree, with his mother, things had broken away from her—a great deal of her strength, a little of her courage, but chiefly years of

another trust. His eyes turned to the lovely head near his shoulder. In a moment Toinette raised her eyes to meet his, and even with his mother they had not been so deep and gentle.

"They must have caught my uncle out there," he said, keeping his voice steady and gazing over the forest tops of Forbidden Valley. "He set the signal fire for us and then was killed. I would go and find him, if it were not for you."

"I will go with you," answered Toinette.

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain's brother Hepsibah who is a trader pays them a visit. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight. That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems. Friction between the French and English grows steadily worse and there are rumors of war and massacre. One day Jeems takes a trip to Lussan's and as he returns just at dusk he finds his home on fire.

Jeems finds his father and mother dead and scalped by Indians and later finds Tonteur Manor also burned. He finds Toinette unharmed by the raiders. She bitterly denounces and then tries to kill him.

pride built out of hollow teachings. There, just as the fires had changed Jeems in another way, they had made of her the child whom Catherine had prayed would come to her some day.

She was not so tall at Jeems's side. She was not so dispassionately cold and white, ready to hold out her arms to death if it should come her way. The glow in her eyes was a different glow. It was dark with desolation and held imperishable depths of torture. But in it were other things. She was seeing the endless walls of the forest again, the coming of night, the loneliness of the world, her helplessness, and the strength of the one at her side. Her cup filled with horrors had turned her, like Niobe, to stone, but now warm flesh was returning with its frailties and weaknesses, giving her once more a recognition of life and a hunger for it. She looked at Jeems. As a child, years ago, she might have let him lead her in this way deep into a forest where he was unafraid and sure but where shadows and mysteries set her heart quaking. Her fingers clung to his.

They passed his mother's gardens of flowers where choice blooms were nodding, filled to overflowing with ripening seeds; they skirted the turnip field where a purple-breasted crop lay waiting for spicy frosts to give crispness and flavour to its flesh; they cut through the heart of a new clearing where many shag-toothed stumps were piled ready for winter use in the cabin fireplace. In a place where fresh dirt was scattered about were tools used yesterday—axes and shovels and hickory prying poles and the big double-bladed grub hoe which Hepsibah had made at Tonteur's forge. On a stump partly dug from the earth was one of Hepsibah's pipes made of half a corn-cob with a hollow reed for a stem. Near this stump, looked at them shyly, was the gopher who had once lived under it.

Jeems stopped and looked about, his throat almost tensing for the old familiar call to Hepsibah. Many times he had made the woods and the lower lands echo with that cry and had heard his uncle answer it. But now the stillness warned him. Like a friend it was whispering the sacredness of

But Jeems turned west and did not look back at his home or betray the choking in his breast. In the maple wood, where the sap spigots and poplar troughs were still under the trees, fallen leaves made a frolicsome sound as they went through them. Their loudness did not alarm Jeems and he found himself talking to Toinette as if she were the child of the old days, and he, changed into a man, were explaining things. He described for the first time how the savages had come while he was on his way home from Lussan's place, and gave his reasons for believing they had departed in haste, leaving many things, like the gathered crops of fruit and grain, which they would surely have taken had they not been pressed by circumstance. He thought their number must have been as great as Toinette supposed—and she had seen them by scores from her bedroom window at the Manor. He was sure they had not gone farther down the Richelieu but had turned back through Forbidden Valley to the Mohawk country. Their own hope was to swing westward out of the path of stragglers, then eastward again toward Lussan's. He told her not to be frightened at the noise the leaves made. They would soon be out of them and would come to hidden trails which he knew and to the shelter of woods and swamps where were fastnesses so thick and untrodden that it was dark in them now, with the sun still glowing in the west. Tomorrow or the day following, he would have her safely at the next seigneurie, and there she would find means to be taken to her friends in Quebec. He would then join Dieskau to fight the English. He made this statement without passion or boastfulness, as if to fight were the one thing to do, a fact settled in her mind as well as in his own. The important thing was to reach Lussan's to-night. The Indians would not go near there, for they believed all abandoned places to be inhabited by ghosts and evil spirits. If they stumbled upon it by accident they would get away as quickly as possible. While he talked of these matters, he wanted to ask her questions. How had she got into the mill-tower room—unhurt? Where was her moth-

er? But he set his lips tightly, knowing that he must heal her wounds a little if he could.

In the deeper woods where the Big Forest began were greater stillness, more gloom, endless and mysterious aisles of twilight all about them. The sun went out. Under their feet was no beaten trail but only the rough and uneven mould, a pad of spongy softness incapable of giving sound. He still held her hand as darkness gathered closer.

In this gloom she whispered:

"Does your arm hurt, Jeems?"

"No. I had forgotten it."

"And your face—where I struck you?"

"I had forgotten that too."

Something touched his shoulder lightly. He could not tell what it was, for they were in a pool of darkness. But whatever it might have been, a falling leaf, a twig, even shadow itself—it filled him with a strange exaltation.

He would have felt the same if his mother had been at his side, as helpless as Toinette and as dependent upon him. Out of the wreck of a world obliterated in a scourge of horror he had a soul besides his own to fight for.

Twice in the next hour Odd halted and gave a growl which warned of danger in the air. Jeems strained his eyes to see and his ears to hear—and once more, when they stopped to listen, he felt the gentle touch against his shoulder.

They struck a deer run and followed it into a plain between two lines of hills where a devastating fire had passed some years before. Here they travelled through a young growth of bushes and trees reaching scarcely above their heads, with the light of the stars falling on them. It stirred a soft radiance in Toinette's smooth hair and illumined Jeems's face until the wounds made by her hands were plainly revealed. They climbed the northernmost hill after a time, and at the top of it stopped again to rest.

Jeems, like Odd, stood tense and listening, searching the slumbrous distance of the wilderness which lay about them. He caught all movement and all sound, the direction of the wind, the shifting play of the shadows, the almost noiseless flutter of an owl's wings over their heads.

And then he knew what had touched his shoulder in the darkness—Toinette's cheek pressing against it for a moment as lightly as a feather.

He felt her trembling. When she looked at him, her eyes rested on the brand of the musket barrel which lay in a red stripe across his forehead. The stars seemed bigger and clearer when at last they came to the half mile of abandoned road which ended in Lussan's clearing. It was the road down which Jeems had watched Tonteur and Paul Tache and a proud little princess ride to the sale years before. Now the princess walked unsteadily at his side. She was white and fragile in the starlight, and her strength was gone. Her dress was torn by brush and briars, and the thin soles of her shoes were almost worn from her feet. They came to the old tree where he had concealed himself while they passed, and something made him tell her about it. He was sorry, for in a moment, a sob answered him. She caught herself and struggled bravely as they entered the clearing, with the ruin of the house ahead of them. Both were so tired in soul and body that their minds seized upon this end of their journey as a relief from longer supporting the burdens of the flesh. In a way, it was like coming to a home which they had forgotten.

The Plains of Abraham

(Continued from Page 20)

For this was Lussan's, a place filled with memories of hope and triumph and bitterness out of which it built a welcome for them even in its loneliness. Toinette's lips almost smiled, as if she saw Madam Lussan at the threshold of the door calling to her above the laughing voices of men and women, above her father's cheery greetings to friends and neighbours, above the restless stamping of her horse's hoofs and the crying of the auctioneer. She might have seen and heard these things but yesterday; now there was sleep—a dark and lifeless ghost of a house, crickets rasping their wings in the tangled grass, a jungle growing where before there had been a broad and level green.

Both were children now, seeing the ghosts as only children could see them, wide-eyed and a little afraid at first, and yet comforted by the nearness of that yesterday in their lives. The stars and the crickets and the rustling grass and the wind in the trees seemed to listen and move to the cautious tread of their feet. A rabbit ran ahead of them. An owl flew off the roof of the house. A bat dipped in spirals and curves before their eyes, and thorns caught playfully at their shoes and clothes. And they felt safe. A warmth crept through their blood, and with it a relaxation of nerves and eyes and brain. Here was sanctuary. Rest. Peace. They sensed these things without speaking as they approached the building. The door was open. Starlight splashed like the golden glow of candles on the floor. They entered and stood silent as if listening anxiously for the voices of sleeping ones whom their entrance might arouse. A cricket singing in a starbeam greeted them cheerily. Emptiness was here, a spectral vacancy, but with it were neither death nor fear.

They were a little apart, and Toinette looked like a broken flower ready to fall.

"Wait for me here," said Jeems. "I am going for an armful of grass."

One of Tonteur's farmers had cut the hay in Lussan's abandoned meadow where Jeems had seen a stack the previous day, and he hurried to this, returning with all he could carry. He made a bed in a corner of the room, and Toinette sank upon it. He covered her with his father's coat which he had brought from the valley and went outside to watch and guard with Odd.

He could hear her sobbing as tears came at last to give her comfort. He fought back a thickening in his throat and a hot flame in his eyes as the boy in him called out for his mother. He, too, wanted this easement for his grief. But he stood—a man. Odd watched tirelessly and sleeplessly with his master.

After a long time, there was silence in the old house and Jeems knew that Toinette was asleep. He went in quietly and replaced the coat about her. Her face was white and lovely, and wet lashes glistened on her cheeks. Timidly his fingers pressed the silken braid of her hair. He brushed a wisp of hay from her forehead. Unconsciously his lips moved. Hope and faith and prayer seemed to stir in the room as he dared to raise the soft braid to his lips, and then he returned to his place outside with something like a glory enshrined with his sorrow.

He sat on the ground with the house at his back and his bow and sheaf of arrows and the English hatchet within reach of his hands. The stillness seemed a live thing that had barred all sound from solemn hours of meditation, and he soon began to feel its influence. Slowly and irresistibly it brought the desire to close his eyes and sleep,

and he rose to his feet in a struggle to keep awake. Odd's teeth clicked and his eyes gleamed with undimmed vigilance.

For hours they watched together and marked every changing shadow. They skirted the edges of the open, advancing a step at a time and with as little noise as the owl wings that now and then floated about them. They scanned Lussan's meadow, and Jeems climbed a tall tree to see if he could discover a glow of fire. At intervals he returned to the house and looked in at Toinette. It was after midnight when he sat down again, and soon the stars seemed to be laughing at him and to be drawing nearer as if they had beaten him in a game. They closed his eyes. Odd rested his heavy jaws between his forepaws and gave a deep sigh. Exhaustion—then sleep. Even the bat, grown tired, went to its retreat in the barn. The stars receded and the world began to take on a deeper gloom. Out of this came an animal scream as a late-hunting owl swooped down and killed the rabbit in the clearing. Odd heard it and whined, but it did not awaken Jeems.

(To Be Continued Next Week)

With the A. A. Poultryman

(Continued from Page 17)

pullets. They will not take the disease for at least six months, and probably never. The vaccine is made by adding water to dried pox scales. Anyone desiring to vaccinate their pullets should get the vaccine through their local veterinarian, or they may send direct to the Lederle Anti-toxin Laboratories, New York.

There are two cautions that should be emphasized. The first, vaccinate before the pullet has started laying but not too soon. From three to seven months is safe. Laying birds may be vaccinated but production will be checked. It is not practical therefore to vaccinate the older birds. This leads to the second caution. A pullet that has been vaccinated and is immune may still give the disease to other birds. Therefore flocks where the disease has never occurred should not be vaccinated at all.

The doctors are still at work and eventually we may be sure they will produce a serum or vaccine that can be used without producing a scab and that can be safely used on any flock, at any time.

In the meantime we have the word of a half-dozen experimental stations and of many poultrymen that the new method is safe and positive in flocks where outbreaks have occurred, and is a God-send to their owners.

L. E. WEAVER.

Farms on which weeds are kept under control have less plant disease than farms where uncultivated areas grow up into luxuriant masses of weeds.

What Constitutes a Contract

MANY letters from our heavy correspondence, show that a contract is frequently signed without recognizing it as such. A contract does not need to be headed "Contract" to be binding and we are again repeating the warning to our readers to sign nothing until it is thoroughly read and understood.

Many of our readers have dealt so often with reliable companies who are always willing to return money for merchandise that they do not realize the significance of signing a contract. Many readers have signed what they thought was an order for some thing perhaps a book or a correspondence course and on receipt of the merchandise, have examined it and finding it unsuited to their needs, have returned it, considering the transaction closed.

Later they find that the company has turned over the account to a collection agency resulting in all sorts of trouble and annoyance. The company holds that they have fulfilled their part of the contract by delivering the merchandise and the fact that it has been returned does not release the purchaser from paying for it.

The courts usually hold that the fact that one party gets a poor bargain does not affect the legality of the contract

May We Help

WE frequently get letters that say "I read on the Service Bureau Page where you have helped others so thought you might help us". Once in awhile we are unable to do what a reader asks but we always do our best and usually we succeed. At any rate there is absolutely no charge for our help. It is yours for the asking. Are you getting your share of service?

neither does the fact that the contract says one thing and the agent something different. If a man can read and write, it is assumed that he read the contract before signing or if given the opportunity of reading it and failed it is nevertheless binding.

Many who sign such contracts without realizing their significance prefer to pay up and charge the loss to experience rather than fight a settlement. The safest and most satisfactory way is to be absolutely sure of what you sign before you take your pen in hand. When you do sign anything insist on a copy and keep it where you can find it.

A Binding Contract

My daughter, who is a college graduate and has been teaching school for several years, was approached last summer by a solicitor of the Athanaeum, Fort Wayne, Ind. He induced her to take a business course by correspondence. The whole course was \$250, and she was to pay \$150 down and the balance at the rate of \$16 per month. She sent in about eight lessons and found that she could not get the time to do them and also have time to teach school. She wrote, asking them to release her and return a part of the money. They replied that she had signed a contract and must fulfill it. She signed some sort of agreement, but did not realize it was so binding. If she stops sending in the lessons, can they hold her for payment of the whole amount?

WE are publishing this letter for the information of our readers and point out to them that practically all correspondence schools require the

signing of a binding contract by students. The only possibility of evading payment of such contracts is to prove misrepresentation at the time the contract was signed. If there was no misrepresentation, the amount is doubtless legally collectable. Schools take the attitude that they are willing to fulfill their part of the contract and the student is expected to do likewise.

We have on quarrel with correspondence schools. However, recent investigations show that considerably less than 10 per cent of all those that engage in correspondence schools ever complete the work. Perhaps this fact has some bearing on the requirement that students sign a binding contract before they enroll for the course.

Investigate First

I am enclosing a letter which I received in the mail today. I understand that several people in this vicinity have received similar ones. Just what do you know about this concern?

THE letter enclosed by our subscriber was from Lee Evans, who called himself chief engineer, 66 Park Place, New York City. In the letter reference was made to the starting of a business five years ago by H. A. Brinkerhoff, and although the business name was not mentioned, it is probable that the letter referred to the Brinkerhoff Electric Company. Upon investigation we find that Brinkerhoff has been connected with a number of concerns. We are also informed that the Brinkerhoff Electric Company made application to sell stock in Pennsylvania, and was rejected by the Securities Commission of the State a year ago, and that the Ohio Securities Commission issued a "cease and desist" order against the Brinkerhoff Electric Company the latter part of 1928. At that time the Brinkerhoff concern was attempting to sell stock in Cleveland.

We have repeatedly advised subscribers to invest in stock only where the concern has been paying dividends for years, and then not until they understand just what an investment in stock means. We have no report that the Brinkerhoff company has been paying dividends, and we would class it as decidedly speculative. We have no quarrel with those who wish to speculate, providing they are willing to accept losses as well as possible profit.

Tax-Exemptions On Real Estate of War Veterans

I am buying a farm with pension money. When can I be exempted from taxes. Does there have to be a certain amount paid in, or does it have to be paid in full. Am I allowed \$500 tax money now. I have heard that I was exempted \$500 tax money from the time I bought the farm on the strength of being a Spanish-American War Veteran.

THE State Tax Commission advises that real property purchased with the proceeds of a pension granted to a veteran of the Spanish-American War—or of any other war—and owned by the pensioner, his wife, or widow, is entitled to exemption from state, county and general municipal taxation to the amount of the actual pension money used in or toward the purchase of the property. In no case shall the exemption exceed the sum of five thousand dollars. Property so purchased is liable to taxation for the construction and maintenance of highways and for the support of schools.

To obtain the exemption provided by the statute, it is necessary that the owner of property purchased with pension money make application to the board of assessors of the tax district in which the property is situated, setting forth the reasons for asking exemption and stating the amount of pension money used in or toward the purchase

of the property. If, after investigation, the assessors satisfy themselves of the truth of the statement, they shall grant the exemption as referred to herein. If no application for exemption be made, then the law requires that the property be assessed as is other taxable real property in the tax district.

"Charity Appeal"

Enclosed please find a carton for a line of goods which an agent claims to sell for the benefit of orphan and crippled children. This agent takes orders and delivers later. Is this a legitimate proposition? Do the proceeds go to and for a good cause or do the individual receive the benefit?

WE understand that the S & H Co. pay a certain sum each month to the Frances Juvenile Home in return

Appreciates Check and Service

I GRATEFULLY acknowledge to you the receipt of the North American Accident Insurance Company's check for \$80.00 which you recently sent me.

It certainly has done a great deal to lighten our misfortune caused by my accident and I cannot speak too highly of the service you are rendering to your subscribers by selling them such a fine policy at so very reasonable a rate and you certainly pay all that the policy claims for my claim was paid in full for the eight weeks that I was unable to work.

I thank you for both the money and the very fine service rendered.

Yours very truly,
Joseph M. Eiband,
Arkport, N. Y.

for permission to use the name of the Home to promote the sale of their merchandise. Therefore, the claim which they make, namely, that a certain part of their profits go to the Home cannot be called fraudulent. At the same time, most Better Business Bureaus frown upon this method of selling because they believe that all merchandise should be sold on its merits and not through a charity appeal. Those who buy products from this company have no way of knowing just what percent of what they buy goes to the Home.

It would seem that a good rule to follow would be to buy products on their merits and to give money for charitable purposes according to the same rule.

Dogs Do Not Always Protect

I think that a change in the dog law is necessary. Under present conditions farmers cannot have any protection to keep their products from being stolen and if a farmer should shoot a man for trying to get into his chicken coop he would be fined.

WE have always had serious doubt as to the value of a dog for keeping away chicken thieves. Several cases have come to our attention where a dog supposed to be very savage was made completely ineffective by clever work on the part of the thieves. However, we recently heard of one case where a man had two watch dogs that were tied at night on a wire running between two poles in front of the chicken coop. They were attached to the wire by a chain and a ring so that the ring could slide along on the wire as the dog moved. In this way the dogs were not at large and yet they had quite a bit of freedom.

We always hesitate to advise shooting any human being yet we believe that the owner should not hesitate to do so provided that he first gives the thief the order to stop. In case the thief refuses to obey the order, the man is justified in shooting at him, always shooting low in order to stop the man instead of killing him.

Maytag

Aluminum Washer

*For homes with electricity, the Maytag
is available with electric motor.*

Let your Maytag Churn the Butter

The Maytag churn attachment is an aluminum churn of 3 gallons churning capacity. It sets over the gyrator post and utilizes the same power that washes the clothes. Water in the washer tub keeps the cream at the proper churning temperature. Easily cleaned, durable and a time and labor saver.

A Gasoline Powered Washer Built, Sold, Guaranteed and Serviced by One Organization

THE Maytag gasoline Multi-Motor is the only engine built by a washer company for washer operation... it is built by Maytag for the Maytag. The Maytag organization alone is responsible for the perfect performance of both the washer and the engine.

Fifteen years' development has brought the Maytag Multi-Motor to a high state of perfection. There are only four moving parts. The carburetor is flood-proof. High-grade bronze bearings are used throughout. Bosch high-tension magneto and speed governor give it a smooth, steady flow of power. A thrust of the foot pedal starts it. By removing only four bolts, it is interchangeable with the electric motor.

Every farm woman is entitled to the Maytag. The saving in time, clothes and effort makes it a profitable investment. There is only one Maytag... The washer with roomy, cast-aluminum tub, gyrofoam washing action, new-type roller water remover, and precision-cut steel gears... the lifetime washer.

A Week's Washing

Free Write or 'phone the nearest dealer for a Maytag. Do a big washing with it. It will take but an hour or two and you will be surprised at its speed, thoroughness and convenience. If it doesn't sell itself, don't keep it. Deferred payments you'll never miss.

Farming in Bermuda

Growing Intensive Garden Crops On a Small Area

IN the usual sense of the word, there is almost no "farming" in Bermuda. There is, however, a limited amount of specialized and very intensive gardening. The Department of Agriculture says that only 26% of the surface of Bermuda is under cultivation—the

Jared Van Wagenen, Jr.

remainder being woodland, steep rocky slopes (there is a good deal of this) roads, golf courses and land required for residences and streets so that the real gardening of the country is done on only a little more than 3,000 acres. To me the astonishing fact is that a country whose whole agricultural area is hardly larger than a prosperous school district of Western New York should nevertheless have succeeded in giving a very widely known trade mark name to her potatoes, onions and lilies. When I see what an utterly insignificant bit of land there is, I cannot escape the conviction that there is a vast quantity of "Bermuda" potatoes and onions that never had any connection with the island. By this I mean that "Bermuda" is a sort of grocery store term for the first new potatoes and for any large, Southern onions. In most places the coral skeleton of the island is overlaid by only a very thin layer of soil with many rocky outcrops. What soil there is represents the insoluble material left from the decay of the coral rock and geologists estimate that it requires a hundred feet of coral to leave a single foot of soil. The soil is very often only a foot deep and rarely as much as eight feet. No wonder that it suffers severely in what we would regard as a very moderate drought. Bermuda soil is

By JARED VAN WAGENEN, JR.

typically reddish—sometimes almost brick red in color. The marshes are dark like our own mucks and the western end of the island is greyish. I do not believe it is what we would call a really fertile soil. Very certainly its outstanding need is nitrogen and everywhere I found wide use of this material both in the form of nitrate of soda and "castor pomace"—this being the residue left from the extraction of castor oil. In general chemical composition, it resembles cotton seed or oil meal which gives it a high value as a source of organic nitrogen. On the other hand it is poisonous to animals and so can be used only for fertilizer. I found this particular material very popular and widely used.

Neither potash or phosphorous seem to be in general use. Probably this decaying coral rock has plenty of lime but if it were lacking, the seashore offers an inexhaustible supply of finely ground coral sand which has a higher percentage of lime than any ground limestone that we know.

The island has an annual rainfall of from

60 to 72 inches—approximately twice as much as we get in New York. The records of the Weather Bureau show that some rain falls on about 180 days a year. It would surely be a trying country for hay making. On the other hand, we happened to be on the island during what they regard as a great drought. During the eight days of our stay, we saw only one shower. It was perfect weather, yet despite blue skies and brilliant sunshine, we realized that the climate was damp in a sense we do not know at home. Shoes get soft and sticky and hard to put on, the Madam's new straw hat assumed the texture of a dish cloth and clothing acquired a musty smell.

In spite of what seems an excessive rainfall, the light, porous soil with perfect under drainage can be worked almost as soon as the rain stops and I did not hear Bermudians bewailing their "Baptist Climate."

I am sorry to write that I found the farmers in a rather pessimistic frame of mind. They surely have hard going these years. The tourist trade has enormously inflated the price of everything including labor but the price of their products in New York is largely determined by the supply of early vegetables from our own Southern States where labor prices are lower and where land values are only a small fraction of those on the island. On top of these handicaps is piled our tariff against their imports so that I wonder how the Bermuda farmer manages to exist at all, yet somehow or other he still manages to carry on.

Land in Bermuda is very high in price. It is hard to determine just how much of this is due to real agricultural worth and how much to prospective speculative and suburban value. Even allowing for this, Director E. A. McCallan of the Island Agricultural Experiment Station tells me he believes that good land is worth 200

To Save Money on your Feed Bill

WHEN you have feed delivered to your barn, the dealer is forced to charge you not only for the feed but for the services of handling, storing, and delivering that feed.

There are three ways that you can save money on your Purina feed bill:

1. Haul it yourself right from the car and thus save the dealer expense of handling and delivery.

2. By paying cash for your feed you save the dealer bookkeeping, interest on credit. He can pass this saving on to you.

3. There is still another way to save on Purina. Buy your fall supply now and get a quantity price.

By saving these service charges, the dealer will be able to make you some real savings on your feed bill.

Farming in Bermuda

(Continued from Page 1)

pounds—say \$1000 per acre. I am very skeptical that land can be worth this much to farm even remembering that it is cultivated by most intensive methods and that three crops a year are not uncommon. Of course there is the factor of a very dense population with only a little land available. Then there is the very unusual policy which provides for almost no land tax in Bermuda. Most of the revenues of the island are from indirect sources—tariffs, excise duties and the like. Every tourist who lands on the island has to pay \$3.00 before he can escape again. The absence of a land tax makes it easy to hold land almost indefinitely. Most farmers lease rather than own their land and about the best agriculture I saw was on one of the "Glebe" farms—i.e. land owned by the church.

Bermuda farms are almost invariably small—gardens or truck patches rather than farms. Six or eight acres constitutes a big farm. Perhaps 15 will be almost the upper limit.

It is not easy for a States' farmer to discuss crops with a Bermudian because in many ways we speak a different farm language. The word "acres" is hardly included in his working vocabulary. He speaks and thinks in terms of "rods". If he has a celery patch of an acre and a half, he tells you there are 240 "rods"—testimony to the scarcity and value of land and the intensive character of his agriculture.

Farm labor is by no means low priced—probably not less than in New York State. Nevertheless everything is done with a far larger proportion of hand work than with us. Indeed the very close planting often makes horse tillage impracticable. There is no place for head-lands or wide rows where land is worth \$1000 per acre.

Bermudians will tell you that agriculture is depressed and unprofitable nevertheless, I observed with interest the Herculean labor even now being devoted to the reclamation of marsh lands. These marshes cannot be drained by ordinary methods because they lie practically at sea level and would be subject to flooding at high tide. I saw however where men were stripping off the rich, black muck soil, filling in the marsh several feet deep with rocks and then again covering them with the original soil, in this way raising the level of the marsh several feet and bringing it above the high tide line. This gives valuable land but at the cost of incredible labor. Work such as this demands almost infinite industry and patience.

One thing is certain, any man from the States who might move to Bermuda to engage in agriculture would have to throw away most of his inherited notions as to how it should be done.

Take potatoes for example. The Bermudian grower is planting them in rows 22 inches apart and then dropping the seed only 7 inches apart in the row—a practice that requires a very large quantity of seed per acre. Probably one reason for this is the very high price of land which leads to the effort to utilize every square foot but I was assured by several that the main reason for this close planting was in order that the plants should protect each other from being whipped ("licked" is the Bermuda word) to pieces by the sometimes violent gales that sweep the land. For the same reason, there are frequent wind breaks of oleander hedges.

By the way, if you ask a Bermudian farmer his yield of potatoes, he does not say—so many barrels per acre—or rod. He says "I got five to one" or "seven to one" meaning thereby five barrels from a barrel of seed. On the average, yields do not seem large although one man told me that he had sometimes secured about a barrel per rod—or say more than 400 bushels per acre.

On the Experiment Station farm a mile from the ocean (which is about as far as you can get on Bermuda) I saw potatoes showing considerable "spray injury". Now spray injury did

High Spots in the N. Y. State Fair Cattle Show

To See These Fine Animals Is To Be Proud of Our Cattle Industry

BY actual count 1116 animals made up the cattle show at the New York State Fair in 1929. Eight hundred fifty-six of these animals were stabled in the cattle barn and 260 were housed in the new temporary cattle barn built for the boys and girls.

The foundation of our New York State agriculture is in animal husbandry on our farms. It is beautifully exemplified by the 4-H boys' and girls' show at the Fair. I had the pleasure of walking through the Coliseum with your Editor, Mr. Eastman, on Tuesday—the big day for the boys and girls and their animals. We noticed particularly a brother and sister about ten or eleven years old, showing their two beautiful Guernsey calves. All through, the quality of the Junior show was wonderful. In the regular classes, as well as in their own classes, they make their elders step.

While it is not the place in this article, perhaps, to make any criticisms, I think it is the place to call to the attention of the people of the State the great need for better quarters for our Juniors. The boys and girls first of all have a poor place to live. They come to the Fair for the week and they work hard. They have to take second place as far as quarters for their animals are concerned, and the children themselves do not have an adequate place either to eat or sleep. At our next Legislature we must take care of this and make appropriation for a suitable building.

This morning I walked through the temporary, canvas-covered barn where the cattle are housed, and a finer exhibit of cattle I have never seen.

The 856 cattle in the main building were di-

By E. S. SAVAGE

Superintendent of Cattle, New York State Fair

vided up as follows: Guernsey, 223; Holstein-Friesian, 179; Jersey, 106; Ayrshire, 98; Brown Swiss, 62; Milking Shorthorns, 59; Aberdeen-Angus, 77; Hereford, 25; Shorthorns, 17.

The outstanding show in the regular classes was the Guernsey show. They clearly excelled

and the demonstration was made by Ward Stevens of Liverpool, the official representative of Holstein-Friesians of America.

The plan of herd classification is as follows: A breeder applies to the national association to have his herd classified. The herd is divided then into five groups: (1) those females which may be classed as excellent; (2) those females classed as very good; (3) for females classed as good; (4) females classed as fair; (5) females classed as poor.

The registration certificates are taken away from all females classed as poor. This means that no offspring can be registered from these animals. In fact, the poor females are no longer registered.

Only heifer calves may be registered from those females in a herd classed as fair.

The classifications of excellent, very good and good animals give a breeder a fine opportunity in helping him to sell his bull calves. Naturally, I believe that the outcome of this is

going to be that only pure-bred bull calves from the excellent and very good females will be used for breeding purposes.

The national association has also made a start in the blanketing problem. It has asked that blankets be removed from all animals from nine to five each day of the Fair. It was not possible to enforce this ruling at the New York State Fair this year. Next year, however, this rule will be enforced.

The AMERICAN AGRICULTURIST has always stood for this point. It has also stood for adequate information over the stall of each animal.

(Continued on Page 13)

Secretary Hyde and the 4-H Boys and Girls

SECRETARY ARTHUR HYDE of the United States Department of Agriculture visited the State Fair this year and made a rather careful study of all the leading exhibits. As he walked through the fine show of dairy cattle, he noticed several boys and girls resting by the heads of their fine animals that they had brought to the Fair, and, judging by his interest, the Secretary was more pleased and impressed with these boys and girls, their exhibits, and their apparent interest in agriculture than by any other thing that he saw at the Fair.

Under Professor Savage's management as Superintendent, the exhibits of cattle at the Fair and the lessons to be learned from them have constantly improved in value from year to year. You will be interested in some of the things about this great cattle show that Professor Savage discusses on this page.

the other breeds this year, not only in numbers but also in quality. They are to be particularly commended on their show because, after all, the numbers of Guernseys in New York State are not nearly so large as the numbers of pure-bred Holsteins. The Guernsey people, however, put it over the Holsteins a little this year in both quality and numbers.

The national association of Holstein-Friesian breeders should be highly commended this year on two points. They put on a demonstration of herd improvement work by demonstrating the herd classification plan. This was announced by Mr. Frank Price of the Holstein-Friesian World,

Some Serious Trends in the Vegetable Business

Growers Need a Definite and United Program to Increase Their Prosperity

EDITOR'S NOTE—A talk by Professor Paul Work our vegetable gardening editor, at the recent convention of the National Vegetable Growers Association contains so much everyday common sense that we are giving you a summary of it on this page.

Paul Work

VEGETABLE production in America is exceeded in value only by cotton and corn, and it represents about 10 per cent of the total value of American crops. The wheat crop, in spite of its vast acreage, is worth less in dollars than the vegetables, and all fruits together amount to about two-thirds as

much. The progress of the vegetable business during the past ten years has, in some respects, been most gratifying and in other respects discouraging. The public uses far more vegetables than ever before. Carlot movements have gained from 383,000 cars in 1920 to 587,000 cars in 1928.

The area planted to seventeen leading crops has grown from one and one-third million acres to nearly two and one-third million acres. The area devoted to potatoes, cabbage, onions and sweet potatoes has changed relatively little. The areas devoted to beans, slicing cucumbers, lettuce, spinach and green peas have

By PAUL WORK

Professor of Vegetable Gardening, Cornell University

been multiplied by from five to ten. There has been little change in the total value of vegetable crops produced. The public has gotten the vegetables but the grower has not received the money. The price index of fruits and vegetables for the past eight months is 112, the lowest of any farm group, lower even than grain (116) in spite of the slump of last May. The index for this period for all agricultural products is 136, for things bought by farmers 156, for all commodities 151. Vegetables are lower than usual but the trend has been downward for four years past.

Average yields of many crops have actually declined, some by over 50 per cent. Only two important crops have gained. This probably re-

flects the tendency of farmers in general to take up vegetable crops under unsuitable conditions. This may be due to pressure of low returns from other crops, to promotion efforts of commercial and transportation interests, to the urge to diversify, to an impression that truck crops are highly profitable and through hope that a "big killing" may be made this time. All of these factors tend to enlist producers who cannot do the thing well, who cut the average of quality and who contribute to over production and so undermine the general price level reducing the profit of all.

Some growers of every crop are making some money, but much adjustment is needed in order to attain the ideal of an abundant supply of vegetable food at moderate prices with fair profits. The world should know that competition in the

vegetable field is extremely severe and that these crops should be undertaken only where soil, climate, transportation, selling facilities and the personal factors are highly favorable. There should be no effort to discourage persons who can meet these conditions, for the business is a good one under proper circumstances. On the other hand, vegetable production should be undertaken with great caution, using careful cost account methods to find whether a profit is actually recorded or not. The money-loser hurts himself and the whole industry. It is far better to stay

(Continued on Page 6)

A new development of interest to vegetable growers. Spraying melons without damage to vines by means of a movable spray boom. This method can be used with any closely planted crop.

May It Rain Before You Read This

NOT in many years have we had as bad a drought as has prevailed generally throughout the country during the present season. It has been a pleasant summer to live, but a bad one for crops, and unless some sections get rain pretty soon, it is not going to be very pleasant to live, for many farmers have already had to begin to haul water. Western New York and Eastern New York seem to be the worst affected. In the East, Long Island potato growers are feeling pretty blue and are predicting only a half crop of late potatoes. So far, upstate potatoes look pretty good, but all fall crops are suffering.

Probably the less said about the drought the better. Unfortunately, nothing that we can say will make it rain.

High Lights of a Good Fair

GEORGE ADE, the humorist, used to tell the story about the "Fool Killer" who, wandering abroad with his trusty club, came upon a high board fence. Peering over, he found the enclosure filled with people. Their plight interested him for the sun beat hotly upon them. The dust from many dragging feet rose in their nostrils; many mopped their brows and carried coats upon their arms; children squalled; the din of mingled noises and weird music filled the air and sawed at the nerves.

"Who put them in there?" the Fool Killer asked a passerby.

"Oh, they went in—it's a fair", the citizen replied.

"You mean they went in there voluntarily?"

"Not only that, but they paid good money to go in."

The Fool Killer looked them over speculatively and then at his well worn club and concluded that there were too many of them, and went away in discouragement.

This may apply to some fairs, but not to the recent New York State Fair. The weather was ideal, the exhibits were about the best we have ever seen, and there was something of interest doing every minute. Space will not permit even a summary of all of the interesting exhibits, but there were some features that deserve special mention.

The boys and girls in the spelling match, the

4-H Club exhibits, and in the Young Farmers' Clubs did much to make the Fair a success, as they surely will the future of agriculture in this country. It is a reflection on our State that these thousands of young people had no decent headquarters at the Fair either for their exhibits or for themselves, and certainly one of the outstanding needs of the State is a boys' and girls' building on the Fair Grounds.

The Agricultural Museum has fully justified all of our claims for it. Any number of persons said that it was the best thing on the Fair Grounds. The only criticism of this building is that it is already too small. Thousands crowded through to see the old-time exhibits and crafts, and most of the time the crowds were so dense it was difficult to see what was going on.

If one needs to realize the tremendous change which has taken place in agriculture and agricultural methods within the space of one man's lifetime, he should go into the Agricultural Museum and look at the tools which our fathers and mothers once used, not so long ago, and then take a walk through the exhibits of agricultural machinery which is used on the farms today. These farm machinery exhibits, by the way, were just about the best and most complete that we have ever seen.

We have already described in other columns the great horseshoe pitching tournament and the exceptionally fine cattle shows.

People are raising more flowers in this State, as evidenced by the most beautiful exhibits we have ever seen, but one does not have to go to the Fair to realize the growing love of flowers. They have been blooming in recent years in almost every farm yard.

A great deal of credit is due to E. C. Weatherby and to the County Farm Bureaus for the county exhibits. Everyone who lives in these counties and made these exhibits, and had the privilege of seeing them at the Fair, must have been proud of his county and his Farm Bureau.

On the whole, the Fair was the best it has ever been, and it is getting more toward the ideal of a true farm exhibition. Commissioner Pyrke, Director Ackerman and their associates who have been responsible for the improvement in the Fair exhibits and standards are to be especially commended. They have rendered a real service to agriculture.

It does not seem to us, however, that the interest in the exhibits and in the Fair, judging by the attendance and the enthusiasm of the people as we have observed them, is as great as it used to be. Are people becoming tired of fairs? What, if anything, needs to be done in the way of changing the entertainment and exhibits to attract and hold the interest of more people?

Notable Speeches at Barnum Dinner

THE high spot in the events of the New York State Fair, and for that matter in the agricultural affairs of the year, is the Barnum dinner, given in honor of the farmers of the State by Jerome D. Barnum, publisher of the Syracuse Post-Standard.

The Barnum dinners in other years have been notable affairs, but the one this year was in our opinion the best of them all. Here were gathered several hundred of the outstanding agricultural leaders of New York and of the United States, including Secretary Hyde of President Hoover's Cabinet, and Franklin D. Roosevelt, Governor of New York State.

Secretary Hyde's speech at the dinner was filled with practical common sense, and every man who listened to him went away with the feeling that American agriculture had a real friend and a man who understood the farmers' problems in the person of the present Secretary of Agriculture.

In a humorous way, which kept his audience laughing, the Secretary emphasized the fact that most Mid-Westerners think that there is little

or no farming in New York or in the East. Then he proceeded to quote figures showing how important our agriculture here really is. Secretary Hyde also was very emphatic in his statements in regard to land reclamation, and pointed out the absurdity of the Federal policies of trying to keep down the surplus on one hand and bringing more land into production on the other.

H. E. Babcock, the second speaker, won the approval of his audience with the theme of his talk that only ten per cent of the farmers' troubles are political and can be cured by law while ninety per cent are economic and must be remedied by better marketing agencies, both buying and selling.

The program was brought to a close by the address of Governor Franklin D. Roosevelt, whose friendly personality and sympathetic understanding of the farmers' problems always win the attention and support of his farm audience anywhere. The Governor spoke of the need of keeping the New York milk shed intact and brought out the idea that both consumers and producers would profit by a better distribution of farm products in order to avoid market gluts. The Governor also emphasized the need of preserving, so far as practical and possible, eastern markets for eastern products.

The farmers of the State, as well as those who attended the dinner, are indebted to Mr. Barnum for centering on the occasion of this dinner the attention of the whole State on the problems of agriculture.

Horseshoe Tournament Center of Interest

IF you have ever pitched horseshoes, be sure to read the article on page 5 describing the tournament at Syracuse. If you had not seen it with your own eyes, would you believe that a man could pitch five consecutive double ringers followed by a single ringer, making eleven consecutive ringers out of twelve shoes pitched? This record was made by Mr. Brain of Cattaraugus County in the preliminaries at Syracuse.

We used to think that we could throw horseshoes some, but after watching the games at the State Fair tournament for a while, we feel like going out back of the barn and practicing a long, long time.

Yes, sir, barnyard golf is a great game, and getting better all of the time. You should have seen the hundreds of people crowded around the courts at Syracuse both days of the tournament.

Eastman's Chestnut

PETER G. TEN EYCK told a story at the Barnum dinner during State Fair week that is worth stealing and passing on. It goes something like this:

During the war, a young man was doing considerable worrying for fear that he would be drafted, and a friend tried to console him. He said:

"Whatever happens, you still have two chances. Now you either will be drafted, or you won't be. If you aren't, you're all right. If you are drafted, you've still got two chances:

"You either will be sent to France, or you'll be kept on this side. If you're held over here, you're all right. If not, you've still got two chances:

"When you land in France, you will either be kept in the camp on the coast, or sent to the front. If held in camp, you're all right. If you're sent to the front, you've still got two chances:

"When you're in the trenches, you either will go over the top, or you won't. If not, you're all right. If you're sent over the top, you've still got two chances:

"You either will be killed, or you won't. If not, you're all right.

"If you are, you've still got two chances!"

Barnyard Golfers Make Records at Syracuse

Horseshoe Pitching Tournament Biggest and Best Yet

By D. D. COTTRELL

Secretary, National Horseshoe Pitchers Association

CROWDS thronged around the clay courts at the State Fair all the time that the American Agriculturist-Farm Bureau State Fair seventh annual state horseshoe pitching tournament was being held on Tuesday and Wednesday. Bleachers had been provided at one end of the courts for the comfort of spectators but the other three sides were filled with interested watchers packed so closely most of the time that standing room was at a premium. Frequent remarks of astonishment were expressed when sometimes four ringers were pitched

complete the preliminaries. The results of the playing of these sixteen men are given herewith in Table A. Early Wednesday afternoon the six men winning the most games in the preliminaries each began playing each other one 50-point game in the finals to decide the championship and the order in which the highest six prizes were to be awarded.

The best game in the preliminaries was pitched by Brain of Cattaraugus

when he won from Adams the only game that Adams lost. The score was Beardsley 50 points, 36 ringers, 5 doubles - Adams 49 points, 36 ringers, 7 doubles, out of 86 shoes pitched by each. In the 25th inning Adams was in the lead with 37 points to 15 for Beardsley. Beardsley then began to gain until in the 39th inning the score was Beardsley 46; Adams, 45. In the next inning Adams took the lead again by making 4 points. Then Adams pitched a double which Beardsley promptly covered with both of his shoes. Beardsley came back with another double which Adams covered with only one of his shoes leaving the score

49 apiece. In the last inning Beardsley pitched a ringer which Adams was not able to cover with either shoe which gave the game to Beardsley. One of the crowd was heard to remark that this beats a horse race. The thrill is just as great, but in the race it is largely as one horse wins while in such a game so evenly matched there is a

series of thrills as each shoe is pitched, each of which is as great as at the end of the race.

Mr. Adams, the winner of the amateur state championship, made more points, more ringers, more double ringers and his opponents scored less points against him than any of his competitors in the finals. Last year of the seven prize winners only two were over 21 years old and Shackleton who won the championship was only 16. The oldest in the competition owned up to being 60. This year the winner is 62 and the man winning second place owns up to being 66 and still going strong. The youngest in the tournament were Ritz and Albertson, both of whom proved themselves to be worthy opponents although only 16 years of age. The older men seem to have made it more interesting for the younger men this year and to have car-

George Adams, of Norwich, Chenango County, who won the American Agriculturist-Farm Bureau State Fair horseshoe pitching contest at Syracuse.

on the stake by the skillful players quite often two or three times in succession. Most of the onlookers had never seen such skill displayed before in pitching horseshoes and were heard to say to their neighbors that they had not thought that it could be done until they saw it with their own eyes.

There were so many counties that had sent a man to play that it was necessary to reduce the number in some way to not more than sixteen players in order to finish the tournament in two days. In order to do this the men from the thirty-one counties represented, each pitched 50 shoes, the sixteen men making the most points were put into the preliminaries to pitch each other one 25-point game. This qualifying was completed in the forenoon and the preliminaries began soon after one o'clock.

Before the time to stop each man had played nine games leaving each to play six games Wednesday forenoon to

County, in which he pitched 5 consecutive double ringers followed by a single ringer making 11 consecutive ringers out of 12 shoes or a percentage of 91.7 per cent ringers to shoes pitched. He won this game from Albertson, by pitching only 12 shoes for the 25 points. The only other 25-point game won by pitching only 12 shoes was when Turk won from Colegrove. Ninety-one and seven tenths per cent ringers is a record game not only for this tournament but for all previous tournaments played on the State Fair grounds and has seldom been equalled elsewhere.

The best 25-point game considering the number of ringers was when Turk won from Storrs by pitching 19 ringers, 3 doubles while Storrs made only 24 points by pitching 18 ringers, 3 doubles. Nineteen ringers was the most pitched in any 25-point game. Brain also pitched 19 ringers, 6 doubles in his game with Pickard. Beardsley pitched the best game in the finals

TABLE B—RESULTS OF FINALS

PRIZE	NAME	W.	L.	PTS.	R.	DR.	SP.	OP.	PCT.

HOW WOULD YOUR FARM LOOK FROM AN AEROPLANE?

Zinc Insulated Fences in the following Brands: American, Royal, Anthony, Monitor, National, Prairie and U. S.

In your vicinity are certain farms that pay real dividends—and others that operate on a loss. From an aeroplane you could easily determine why this is so. The poorer farm would appear to you as a confused and irregular jig-saw puzzle—the prosperous one would show clearly the defined fields and pastures divided and controlled by Fence.

Zinc Insulated Fences

The need for fence is too vital to be overlooked—or even postponed, for under present conditions the difference between profit and loss depends upon securing the utmost value from every acre of land. The rotation of crops—the condition of livestock and the hogging down of corn, are a few of the essentials in profitable farm operation that the proper use of fence makes possible.

Yes—fence is a definite need—and American Steel & Wire Company's Zinc Insulated Fences best fill this need. Years of service have proven them to be the best investment. Sturdily constructed of the finest material and covered with a heavy *uniform* coat of zinc, they will give longest life and resist corrosion to the utmost.

Near you is one of our dealers. His store is Fence Headquarters and he will render every assistance in helping you select the type of fence that you need. He also carries either the Banner or Ideal U-shape Steel Posts—the best foundation for the best fence. Also ask him about the new National Expanding Anchor Dirt Set End and Corner Posts.

A.A.'s Western New York Farm and Home Talk

Losses from the Drouth Increase

THE outstanding topic of conversation in Western New York is the drouth and its effects. It is assuming a disastrous character in many places. Local thunder showers have afforded a little relief here and there, but along Lake Ontario and especially to the westward almost no rain has fallen in weeks.

By M. C. BURRITT

farm product tariffs be raised from

their present level of about 22 per cent ad valorem to the industrial level of 40 per cent. The agricultural level has been raised but so has the industrial level so that approximately the same discrepancy still exists. As usual it looks as if the farmers might get little or no benefit from tariff revision in the aggregate.

M. C. Burritt

A practical example of how the value of a tariff may be lost may be seen in milk products and dairy feeds. All cattle products have been given good tariff protection, thanks chiefly to good organization of the dairy interests. Now the Senate bill proposes a tariff of six dollars a ton on soya bean meal, the one new source of needed protein. This will inevitably react to raise the price of other protein concentrates, particularly linseed meal. The proposed tariff which is practically a prohibitive one against Manchurian meal will be of much greater benefit to manufacturers of concentrates than to western farmers. Eastern dairymen will pay for it.

land the next day. Very light showers have occurred several times, but these have been of no permanent value.

To catalogue the losses and troubles accompanying and following this drought would be to list almost every crop in the territory. If other and competing sections suffered the same reduction in crops the resulting prices might have offset the smaller yield. As they did not there may be little or no price compensation. Hence the loss in income is likely to be very large. Spring grain is threshing from a third to a half yield or 15 to 35 bushels per acre, due almost entirely to the drouth. Wheat yields are about half the promise of the early spring, but a too wet April also contributed to this. Second cutting alfalfa is very short. New seedlings are very poor. Canning crops yields are very low. Peas were near a failure. Cucumber and tomato yields are being cut in two. Cabbage cannot give a full crop even where stands are good, and many stands were injured by the early dry weather. Beans and potatoes look the best of any crops, but it is difficult to see how they can produce very good yields under such dry conditions.

Both the direct and indirect effects on orchards have been bad. The fruit is small for this time of year. The continuous dry weather has been very favorable for aphids on apples and psylla on pears and the shriveled blackened conditions of so many orchards is directly traceable to dry weather through the flourishing of these insects. These pests certainly have made orchards look hard. Good spraying has helped but not entirely corrected. I think my orchards in alfalfa sod have really suffered less from the drouth than those under cultivation. The successive cuttings left on the ground over a period of years have provided a mulch which has held moisture well. The effect of heavy applications of manure is also a very noticeable factor in holding moisture with crops as well as with orchards.

And finally though not the least effect of no rain, the water supply for both humans and animals is failing. Wells are giving out. Even reserve cisterns are being emptied. We are compelled to haul water from the creek. Several towns in the area have had to take measures to conserve their water supplies. Every time I write about this drouth I think that it may be raining by the time this is read. But rain does not come. I hope this time will be the exception.

The Farmer and the Tariff Bill

Some months ago I attempted to picture to American Agriculturist readers how the tariff was being made at Washington. The whole process then outlined as being followed in the House has now been repeated in the Senate. The resulting bill though an improvement on the House bill, as pointed out by the editor in the issue of August 31, is still far from affording tariff "relief" for farmers. The basic demand of agriculture was that

Bartlett Pear Prices Are Good

Bartlett pears are about ready for harvest, in fact picking has already begun. The price is unusually good because of a small United States crop. The ruling price here is about four cents a pound for No. 1's, two inches and up and one and a half to two cents a pound for inch and three quarters to two inch No. 1's. Psylla injury is bad in many orchards. The crop is less than half a full yield here.

Some Serious Trends in the Vegetable Business

(Continued from Page 3)

out or to quit knowingly than to face the tragedies of bankruptcy.

The plight of those already established in the business is serious by reason of the competition of those who are themselves losing money while they hammer down prices through overproduction and poor goods. Not much relief is to be expected from without. Growers must develop certain definite relief measures of their own for betterment of the situation.

1. Spread the gospel of cost accounting so that growers will either eliminate a given crop or make it pay.

2. Make economical use all along the line of better equipment, better seed, better plants and other improved means and methods of production.

3. Maintain fertility cheaply, especially by the use of commercial fertilizers which are relatively low in price and by plowing under green manure materials.

4. Battle eternally and intelligently against the increasing horde of insects and diseases which cut yields and ruin quality.

5. Sell a quality product, so grown, harvested, graded, packed and shipped as to command maximum returns.

6. Improve the marketing system, especially in the cooperative field, for low cost and effective selling, and also for taking advantage of the resources of the Federal Farm Board.

7. Adopt a strictly business attitude in the use of land, labor and credit in marketing and in counting profit and loss.

8. Make full use of sound service agencies, public and commercial, to achieve these ends.

The vegetable industry must develop a unified consciousness and must work unitedly for these ends. It will, in these ways, be able to supply the consuming public with wholesome and appetizing vegetable food in great abundance at prices to encourage utmost consumption and at the same time realize the fair prices that are necessary for a prosperous and progressive existence.

Announcing An Improved Pan-a-ce-a with a *new name*

DR. HESS POULTRY PAN-A-CE-A was introduced more than a third of a century ago. From that time it has grown steadily in favor until today the name "Pan-a-ce-a" is a household word among poultry raisers throughout the United States and Canada.

The purpose of Pan-a-ce-a was to help poultrymen to make extra profits from their flocks. How well it has succeeded in accomplishing its purpose is attested by the fact that Pan-a-ce-a now has a greater consumption than all other similar products combined.

Notwithstanding the great popularity of Pan-a-ce-a its makers have never believed in the policy of "let well enough alone." Relentlessly they have striven, through the aid of scientific research, to keep Pan-a-ce-a abreast of the most modern developments in poultry culture—to give Pan-a-ce-a users better and still better service.

By constant experimentation and exhaustive research on our Research Farm, a new and improved product has been evolved.

Mineral materials so necessary in poultry economy and often lacking in the feed have been increased. Calcium and Phosphorus are provided in quantities recommended by poultry authorities.

It does not contain any filler or diluent, thus making a product that is all drugs and minerals, each having a beneficial effect upon the fowl.

The proportions of other ingredients have been changed so as to give a greater beneficial effect.

The new product embraces all of the features of Pan-a-ce-a with additional valuable properties which modern scientific investigation has proven to be of special benefit to poultry.

So that you may know and identify this new and improved product after the publication of this announcement, it shall be known as

Dr. Hess Poultry Pan-a-min

HELPS MOULTERS MOULT. Pan-a-ce-a has helped millions of hens through the moult. Pan-a-ce-a hens have been quick moulters, promptly back on the egg job.

To the moulting hen the new PAN-A-MIN is of even

greater benefit. It has more tonics to promote appetite. It has more minerals to help grow the new plumage.

EGG PRODUCTION. Pan-a-ce-a kept hens in laying trim. Egg production has thus been increased for the Pan-a-ce-a user.

The new PAN-A-MIN goes even farther in helping to maintain a high level of poultry health—more song, scratch and cackle in the poultry house.

REDUCES CHICK MORTALITY. One of the greatest services of Pan-a-ce-a was that of saving the baby chicks.

The new PAN-A-MIN maintains the same high level of chick health, and supplies more minerals for bone, feather and tissue development.

Dr. Hess Poultry PAN-A-MIN is not a substitute for good feed and proper care. Yet feed and care will not take the place of PAN-A-MIN. They supplement each other.

PAN-A-MIN helps to utilize feed and thus gives you greater returns from every feed dollar.

PAN-A-MIN helps to make your efforts count for more profits.

Make Dr. Hess Poultry PAN-A-MIN a part of your regular feeding program—add just 3 pounds of PAN-A-MIN to every 100 pounds of mash. The cost is less than a penny per hen per month.

Dr. Hess Poultry PAN-A-MIN means Pan-a-ce-a *plus*

PAN-A-MIN is put up in 100-lb. iron drums, 25-lb., 15-lb. and 7-lb. cartons. Your local Dr. Hess dealer will supply you according to the size of your flock.

DR. HESS & CLARK, INCORPORATED, ASHLAND, OHIO

NEY

"Naturally follows that production is increased"

MR. J. S. CAMPBELL, Jr. owns the Clearview farm at Butler, Penna. A farm that is nationally known among Jersey breeders. It is the home of Volunteer's Dreaming Sam and many other noted cattle.

The splendid big dairy barn is Ney equipped throughout—stalls, water bowls, litter carriers and pens. Ney engineers designed all the equipment.

And here is what Mr. Campbell says about it: "The Ney equipment has been installed long enough to demonstrate the fact that cows are more easily maintained in proper physical condition than before, and it naturally follows that milk production is increased."

Eleven other progressive dairymen have joined with Mr. Campbell in helping us write an interesting booklet called "Cow Comfort". It points the way to greater dairying profits. Your copy is ready. Just mail the coupon.

We'll include a copy of our complete catalog if you check the square on the coupon. There you will find full facts on the famous fifty year old line of Ney Dairy Barn Equipment and Haying Tools.

BIGGER Milk Profits this Fall

RIGHT now, the most successful dairymen are making sure of maximum fall and winter milk production by putting their herds on Bull-Brand Dairy Ration. Read what some of these hard-headed feeders have done with B-B feed.

"Profits of \$210.00 net per cow last year," says H. M. Baker, Columbus, N. Y. "280 to 290 quarts daily from 21 cows," say Field Bros., Derwood, Md. "8 cows—year's net profits \$1674.68," says Horace Renchler, Hamburg, Pa. "During two months' feeding, my 18 cows have produced one-third more," says John Berube, Fairfield, Me.

Bigger Profits Guaranteed
We guarantee that Bull-Brand Feed will increase your milk profits, too, just as it has for thousands of other dairymen. Try it under our guarantee of your money back if you don't find B-B most productive per dollar of feed cost. Maritime Milling Co., Inc., Buffalo, N. Y.

DAIRY AND POULTRY

Reviewing the Markets

Milk Prices

The following are the Sept. prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond.		
Milk Powder		
Hard Cheese	2.25	90¢
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class I League price for September 1928 was 3.42 for 3.5% milk and Sheffield's 3.17 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

Butter Goes Higher

CREAMERY	Sept. 6, 1929	Last Week	Last Year
SALTED			
Higher than extra	45 1/2-46	44 1/2-45	49 1/2-50
Extra (92sc)	44	44	49
14-91 score	39 1/2-44 1/2	39	43 1/2-44 1/2-48 1/2
Lower G'ds.	38-39	38	38 1/2-42 1/2-44

Brisk demand and lighter receipts have combined to advance the butter market a full cent over a week ago. The dry weather throughout the country is apparently taking its toll. It is believed by many in the trade that the September make, taking the country as a whole, will run behind last year. Compared with a week ago receipts have fallen off close to 5,000 tubs. The improved demand in local consuming channels has brought new life to the market and further expansion is expected next week. At this writing, the butter market is quiet because most of the trade has stocked up pretty well. We do not look for any weakening influence because of the fact that fresh receipts have suddenly become so light that there is hardly more than enough to go around. Consequently there is a swing to storage stock.

Cheese Goes Higher

STATE FLATS	Sept. 6, 1929	Last Week	Last Year
Fresh Fancy	24-25 1/2	23 1/2-25 1/2	26
Fresh Av'ge			24-25
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	
Held Av'ge			

We stated last week, that the cheese market was due for a raise. This has come to pass for fresh cheese is now bringing from 24c to 25 1/2c. The market is firm in the West as well as here in the East, and offerings for prompt shipment are priced fairly high. In spite of the quiet trade here in New York local traders are holding asking prices firm which leads us to believe that the market is strong enough to hold its present level. In the New York shed it is expected that the make will be light due to the increased demand for milk for the fluid market, all of which will tend to keep the cheese market firm.

Heat Hits Egg Market

NEARBY WHITE	Sept. 6, 1929	Last Week	Last Year

Gathered	36-45	36-45	36-42

Live Fowls Higher

The recent hot spell hit the egg market a severe blow at a time when it was rather wobbly on its feet. Receipts have been a little heavier and every favorable factor was needed to keep the advance under way. However, the extremely warm weather reduced the demand for current use and that caused buyers to be ultra-conservative in their operations. Nearbys have been not over abundant but the demand has been limited so that the market has done well to hold its own. Only the fanciest marks have been clearing readily. The rest have been laboring.

FOWLS	Sept. 6, 1929	Last Week	Last Year
Colored	30-32	29-30	33-35
Leghorn	25-27	23-27	30
CHICKENS			
Colored			36-42
Leghorn			35-36
BROILERS			
Colored	25-33	27-35	
Leghorn	26-28	27-29	
OLD ROOSTERS	23	22-23	-20
TURKEYS	35-42	55-42	
DUCKS, Nearby	23-27	22-27	-30
GESE			

Live fowls show some improvement this week, principally because of the fact that

the proportion of fowls in the freight arrivals is small. Most of the cars now contain broilers and when it comes to ordinary stock the market is oversupplied. Most of the Rocks' arriving by express have been sold at 33c, although some were sold at 35c, and efforts are being made to hold that price but it is not official. As was the case in the egg market, the hot weather was looked upon as a very disturbing influence and many feared it would interfere with trade.

Fruits

The demand was a trifle more active toward the latter part of the week on apples, pears and peaches, particularly on attractive quality, large sized fruit and values tended higher. Crab apples, plums, prunes and grapes, however, received scant attention except on fancy stock. Sales ranged widely.

During the preceding week, New York State started the following volume of produce to numerous consuming centers: apples 36 carloads; grapes 3; peaches 2; pears 47; plums and prunes 1, also mixed fruits 5 cars; carrots filled 41 carloads; cabbage 276; cauliflower 12; celery 73; cucumbers 109; green peas 16; lettuce 260; onions 137; stringbeans 7; tomatoes 84; potatoes 471 and mixed vegetables 78.

APPLES—HUDSON VALLEY: bushel baskets: U. S. Grade No. 1, Alexander 2 1/2 to 3 inches \$1.50-2.25; Duchess 2 1/2 inch mostly \$1.50; Gravenstein 2 1/2 inch and upward \$1.50-2.25; Rhode Island Greenings 2 1/2 inch \$1.75-2.25; 2 3/4-3 inch \$2.25-2.75, one lot \$3.00; McIntosh, wide range in color, 2 1/2 inch \$2.50-3.50, few fancy \$3.75-4.00; Twenty Ounce 2 1/2 inch \$2.00-2.50, 2 3/4-3 inch \$2.50-3.00; Fall Pippin 2 1/2 inch \$1.75-2.25; 2 3/4 to 3 inch \$2.25-2.75; Wealthy 2 1/2 inch, wide range in color \$1.50-2.50, 2 3/4 inch \$2.00-2.75; Wolf River 2 1/2 inch \$1.50-2.25, 2 3/4-3 inch \$2.00-2.50; Winter Banana 2 1/2 inch \$2.00-2.50. U. S. Grade No. 1, 2 1/4 inch fruit, various varieties, ranged from \$1.00-1.50; unclassified 2 1/4 inch and upward ranged from 75c-\$1.50.

WESTERN NEW YORK SECTIONS: barrels: Wealthy U. S. No. 1, 2 1/2 inch \$5.00, commercial pack 2 1/4 inch \$3.50.

CRAB APPLES—HUDSON VALLEY: wide range in size, quality and variety, per bushel basket \$1.25-3.50; per 12 quart basket 25c-\$1.00.

GRAPES—HUDSON VALLEY: per gift crate (eight baskets) wide range pack and quality, various varieties, blue 75c-\$1.25; Delaware 75c-\$1.50; Niagara 65c-\$1.25; 12 quart climax basket, all varieties 35-65c, mostly 40-50c.

PEACHES—HUDSON VALLEY: wide range in pack, quality and color of fruit, Elberta, per bushel basket, best \$2.00-2.50, poorer small \$1.00-1.50; per carrier of six four-quart basket \$1.50-3.50; per 12 quart basket, best \$1.00-1.35, poorer, small 50-75c; Georgia Belle, per bushel basket, best \$1.75-2.00, poorer, small \$1.00-1.25. Hale, per bushel basket \$2.00-3.50; per carrier \$1.50-4.50.

PEARS—HUDSON VALLEY & WESTERN NEW YORK SECTIONS & OSWEGO COUNTY: Bartlett, per bushel basket, fancy pack, best \$2.50-3.00, extra fancy large \$3.25-3.50, ordinary \$1.75-2.25; small \$1.25-2.00; Clapps Favorite, per bushel basket, fancy pack \$2.75-3.00, few extra fancy large \$3.25, ordinary \$2.00-2.25; small \$1.25-1.75. Seckel, wide range in size and quality \$2.00-4.00.

PLUMS—HUDSON VALLEY: Damson, per 12 quart climax basket, \$1.00-1.25; per four quart basket 25-50c.

PRUNES—HUDSON VALLEY: various blue varieties, per one half bushel basket, medium sized fruit 75c-\$1.00.

The Inside Story of Outstanding Endurance

BENEATH the tread of every Firestone Tire, you will find layer upon layer of the highest quality cord fabric. These cords are twisted to provide the greatest strength and elasticity . . . then every fiber of every cord, is saturated and surrounded with live rubber which prevents friction and heat.

This is the patented Firestone process of gum-dipping which doubles the flexing life of the cord. Thick cushions of live rubber between the plies provide further protection . . . combined with this is the toughest, safest, longest wearing tread ever developed.

These are reasons why Firestone Tires hold all world records for safety, endurance and mileage.

Write to the Firestone Tire & Rubber Company, Akron, Ohio, or Los Angeles, California, for booklet "The Secret of a Long Life."

The New Two-Door Sedan

From the Farmer's Staunchest Ally Comes the Farmer's Ideal Car

DODGE BROTHERS PRESENT
A NEW TWO-DOOR SEDAN
AT A NEW LOWER PRICE

\$925
f. o. b. Detroit

A most welcome motor car announcement to the American farmer comes from that stronghold of Dependability, Economy, Sturdiness and Long Life—*Dodge Brothers.*

It heralds a new all-purpose family car—with all the quality and performance of other Dodge Six models—with a new full 5-passenger

body style of extraordinary roominess, usefulness and convenience—with a price even lower than the previous Dodge Six price.

The new Two-Door Sedan is ideal for the farmer and his family. It is a sensational new Dodge Brothers achievement in value—offered at the surprisingly low price of only \$925 at the factory.

Where Motors are cheaper than Muscle

Let the electric motor fill your silo—it's cheaper, easier, swifter. And this is just one of the many applications where G-E motors, controllers, and other electric equipment cut costs and labor. ¶Electric grain elevators, motorized grinders, huskers, and shredders will save four-fifths of the time you now spend on these jobs. G-E motors can economically pump your

water, do your threshing, milk your cows, separate the cream, and sharpen your tools.

¶For farm households, G-E MAZDA lamps, refrigerators, fans, and cooking and heating appliances are economical labor-savers.

¶If you are located on or near an electric power line, ask the power company for complete information concerning the possible uses of electricity on your farm.

Tune in on the General Electric Special Weekly Farm Program on WGY (Schenectady), KOA (Denver), KGO (Oakland). In addition, every Saturday evening at 8 P.M. Eastern Standard Time the "General Electric Hour" is broadcast over a nation-wide chain.

Glue melts rapidly in this G-E electric glue pot

Makes good with the men—
G-E single-phase motor
Type SCR

G-E fractional horsepower motors are big helpers on many little jobs

The G-E electric soldering iron is easy to handle and stays hot

GENERAL ELECTRIC

Then...up it goes again!

it's Calumet's
double-action

that makes
better baking

TEST CALUMET'S DOUBLE-ACTION
Naturally, when baking, you can't see how Calumet's double-action works inside the dough or batter to make it rise. But, by making this simple demonstration with only baking powder and water in a glass, you can see clearly how baking powder acts—and how Calumet acts twice to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that takes place in the mixing bowl when you add liquid to your dry ingredients.

After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's second action—the action that takes place in the heat of your oven.

Make this test. See Calumet's double-action which protects your baking from failure.

“WHY do I get such wonderful results when I bake with Calumet?” women are always asking. “Fluffy cakes, light biscuits, all my baking just the way I want it.”

It is because Calumet Baking Powder has double-action. *Two* leavening actions, not *one*. And these two leavening actions protect your baking from failure to a remarkable degree. Women who used to have “bad luck” with baking, women whose ovens were always “acting up,” find it easy to bake successfully with Calumet.

They tell all their friends about this modern baking powder . . . they run in and show their cakes and biscuits to their neighbors. That's why Calumet today is the most popular baking powder in the world.

The test above illustrates Calumet's two leavening actions. The *first* action takes place in the mixing bowl—a steady, even rising that gets the leavening properly started. Calumet's *second* action begins when you put the cake in the oven. It literally “props up” the batter while the oven heat does its work. As a result a cake made with Calumet has a smooth, velvety texture that is simply beautiful . . . Calumet biscuits are light and feathery . . . muffins rise right up to perfection . . . and waffles and corn-bread turn out exactly the way you always hope they will.

Easy Success With Calumet!

All baking powders are required by law to be made of pure, wholesome, healthful ingredients. But not all baking powders are alike in their action. Not all give you equally fine results in your baking. Calumet is scientifically

made of exactly the right ingredients in exactly the right proportions to produce perfect leavening action. Its dependable double-action brings surer baking success, even to women who cannot regulate the temperature of their ovens exactly.

Here's a recipe for Calumet Coconut Cake. Notice that it calls for only *one* level teaspoon of Calumet to a cup of flour. This is the usual Calumet proportion. A double economy, since Calumet's cost is moderate to begin with. Mail the coupon and Marian Jane Parker will send you the Calumet Baking Book—a collection of splendid up-to-date recipes prepared by baking experts.

© 1929, P. Co., Inc.

COCONUT CAKE (3 eggs)

- | | |
|-----------------------------------|--|
| 2 cups sifted Swans Down | 1 cup sugar |
| Cake Flour | 3 eggs, unbeaten |
| 2 teaspoons Calumet Baking Powder | ½ cup milk |
| ¼ teaspoon salt | 1 teaspoon vanilla |
| ¾ cup butter or other shortening | 1 can (1½ cups) Baker's Coconut, Southern Style. |

Sift flour once, measure, add baking powder and salt, and sift together three times. Cream butter thoroughly, add sugar gradually and cream together until light and fluffy. Add eggs, one at a time, beating well after each addition. Add flour alternately with milk, a small amount at a time. Beat well after each addition. Add vanilla. Bake in two greased 9-inch layer pans, 25 to 30 minutes in moderate oven (375° F.). Spread boiled frosting between layers and on top and side of cake. Sprinkle thickly with coconut while frosting is still soft. Double the recipe for three 10-inch layers. (All measurements are level.)

CALUMET

THE DOUBLE ACTING-
BAKING POWDER

New York Farm News

Feeding Heavily to Maintain Milk Production

THE hot weather during the first week of September together with the large number of people in the cities returning from vacations greatly increased the consumption of milk and strained the resources of the dealers to provide an adequate supply of fluid milk.

It takes considerable leeway in the production and distribution of fluid milk to meet the fluctuating demand. During August, for example, the cool weather and the absence of people on vacations decreased consumption and caused something of a surplus, a surplus which was necessary in order to take care of the demand in September.

It is interesting to note while on this subject that the supply of cold storage dairy products is by far the heaviest that it has been in a long time, and very greatly exceeds the supply for the same time last year. There are several indications that we are at the crest of dairy production and that it is time for dairymen to go slowly on increasing their supply for a long time period.

On the other hand, farmers are straining every resource to meet the demand this fall so that the milk shed may be kept intact. The great drought has dried up the pastures and dairymen are feeding heavily of grain and of green feed to keep up production. Never before have we seen more effort made on the part of farmers to maintain production.

and macadam for Chatham-Ghent Highway. New bridge of concrete commenced at New Lebanon.

Another week of drought. There are serious conditions all over the county regarding water supply. There were two grass fires in Kinderhook, making six bad fires there this summer. Retesting of cows is under way in Ancram under Dr. H. C. Parker, the county veterinarian. There are about 2000 cows in the town. On one farm there are 115. Reactors are few this season. Eggs are 46c to 50c, butter 50c, new potatoes are 50c a peck.—Mrs. C. V. H.

Oswego County—It has been very dry here. What rain we have had dried out soon. Large amount of lettuce, cucumbers and beans are being sent to New York. Prices are low—beans 50c to \$1.25 a bushel, cucumbers \$1.00 to \$2.75 a bushel, lettuce 50c to \$1.00. Oats are poor, mostly cut for hay. Fruit, none to speak of. Milk doing well. Cows high. Hay selling at \$10 to \$16 a ton. Potatoes \$2.00 to \$2.25 a bushel. Cabbage 75c to \$1.00 a dozen. Cauliflower \$1.25 to \$2.00 a dozen. Eggs 43c to 50c. Wages are high, \$2.50 to \$5.00 a day. There have been many sudden deaths, Mr. George Crugler who was one of the most prominent citizens was ill only three days. He will be missed very much.—J. S. M.

Steuben County—Extremely dry, no rain for a long time. Crops are not making at all. Many crops are too far gone to be saved if rain does come. Oats and barley are the lightest for many years. Potatoes must be a light crop. On August 10 the Steuben County farmers' picnic was held on the Bath Fair ground. 10,000 people were in attendance.—C. H. E.

Dean F. F. Moon Dead

ALL those interested in the progress of forestry work, as well as hundreds of friends, greatly regret to know of the death of Frederick Franklin Moon, Dean of the New York State College of Forestry at Syracuse University. Dean Moon was one of the best educated men in his profession in America and to his education he added years of practical experience so that his aid will be greatly missed in working out the many coming and increasing problems of forestry.

Tax Problems to be Discussed

DURING the week of September 9 to 13, the National Tax Association is holding its annual convention at Saranac Lake, New York. It has only been in recent years that much attention has been given to the increasing problems of taxation, but now economists and experts are devoting much time to these problems, which should result in particular in more aid for the farmer taxpayer, who at the present time is paying far more than his share. 12pt Fighting For A Better Farm Tariff Bill

Fighting for a Better Farm Tariff Bill

THE tariff situation still continues to boil in Washington. Several Republicans under the leadership of Senator Borah have joined themselves together to fight the tariff schedules in the present bill in the Senate in the hope of getting better schedules and better protection for agriculture.

As the bill stands now, it is an improvement over the rates in the bill passed by the House of Representatives, but agricultural leaders believe that the Senate bill in its present form still will do more to injury agriculture than it will to help it.

New York County Notes

Columbia County—Continued drought throughout the county. H. L. Barton of Ancram Lead Mines brought in five carloads of cows from the north the past month. Peck Schoolhouse and Tanner Schoolhouse in Ancram newly painted, new heating plant and new porch for Peck Schoolhouse. Four Sunday Schools of Copake, Craryville, Hillsdale and North Hillsdale held a joint picnic at Prospect Lake. New shoulders of crushed stone

High Spots in the New York State Fair Cattle Show

(Continued from Page 3)

We are glad that we have accomplished this. We have also been asked to announce the prize-winners more adequately in the judging ring. It has not been possible to accomplish this as yet. We will ask for an amplifier next year so that adequate announcements may be made in the judging ring.

The Ayrshire Breeders' Association made a fine display of their futurity bulls this year. There were six in the class, and prizes of over \$100 each were paid to the winners of this group.

The Jerseys, Brown Swiss and Milking Shorthorns all had fine displays of their respective breeds.

The Beef Cattle Show

I believe that we will see more beef cattle in New York State. A splendid beginning was made this year by the Eastern Aberdeen-Angus Association, of which Mr. McGregor of Briarcliff Farms, Pine Plains, New York, is president and Prof. Hinman of Ithaca is secretary. Through their efforts 77 very fine individuals were shown. Among them was the grand champion of the National Livestock Show of last year at Chicago. When we can have such outstanding animals as this at our State Fair, we may well be proud of our exhibit.

Due to the fact that our Fair conflicts with the Ohio State Fair, with our present date it is difficult to get outstanding exhibits of the other beef breeds. However, we do have a good show of Herefords and Shorthorns.

The Alasa Farm Cup

Mr. Strong of Alasa Farms has donated a cup valued at \$150 to be competed for by cows of any breed in our butterfat contest. The importance of this contest has increased each year. This year we had 14 entries and it was a close race. At the time of writing this article, the winner had not been announced. The leading competitors are scattered among the Milking Shorthorns, Guernseys, Jerseys and Holsteins. Each breed had a strong competitor.

As is always the case, great interest was shown by visitors at the Fair in the judging ring and in the barn. An outstanding thing in our show this year was the large number of State-owned cattle. It was in all respects a real New York State show.

WHEN YOU BUY DIP

3 things

ARE MORE IMPORTANT
THAN THE PRICE YOU PAY

First—How strong is it? How does it compare with carbolic acid?

Second—Is it standardized? That is, will it run uniform, or does it vary in strength?

Third—What kind of emulsion does it make? Milky white? Free from any specks or oily streaks on the top, and free from settlings at the bottom? A poor emulsion not only denotes an inferior dip, but a waste to you.

Dr. Hess Dip and Disinfectant

IS FIVE TIMES AS STRONG
AS CARBOLIC ACID

It has a carbolic acid co-efficient of 5. That's why Dr. Hess Dip

costs less to use, no matter what price you pay for others. It requires less of it to make an emulsion.

Dr. Hess Dip is standardized, always the same, whether you buy it in Maine or Texas, the same yesterday, today and tomorrow.

Dr. Hess Dip makes the finest, whitest, milky emulsion of any dip that you can buy, and stays that way for weeks. The whiteness proves its worth.

Have your dealer place a teaspoonful in a glass of water—and see for yourself how much better it is.

Dr. Hess Dip and Disinfectant kills hog lice, sheep ticks and scab; destroys disease germs; keeps down foul odors; makes living quarters healthful.

Guaranteed.

Women's Interests at the Fair

Visitors Get Information and Amusement

THE annual state fair offers a fine opportunity to get a broad view of what people are doing and thinking. Since New York State Fair aims to be primarily an agricultural fair, farm folk especially can get from it both inspiration and information galore. Of course, one could go merely for pleasure and spend the entire time on the midway or at the races and leave, having had a gee-lorious time but none the wiser as to agricultural or home matters. On the other hand, one can go to the fair and spend hour after hour rushing from conference to speech-making or in judging exhibits or otherwise helping to bear the burden of work attached to such a great enterprise. It is safe to say that almost any normal person could find a great deal of profit and interest to him somewhere on the grounds.

Incidentally speaking, I find that a purposeful tour gets one much more information than just wandering around following the crowd. Many of the exhibits provide demonstrations at certain hours, and in plain view everywhere are posters giving the day's program so that the special features for the day may be attended by those who are interested.

But this article is chiefly about what women were doing at the fair. And there has been a wonderful change in the exhibits of what women do. Formerly freakish, unusual, un-useable things were considered to be the stuff of which women's exhibits were made and, unfortunately, large prizes were often given for such things. Gradually has come the idea—and the practice—of showing useful things made beautiful in their own right. A quilt to be beautiful does not need to be of such fine material and so intricate in design that no one would feel like using it. Prizes are given to the healthiest baby instead of to the prettiest one or the one with the most highly decorated carriage. The emphasis is being placed more and more on the educational aspects of the fair, not only in the exhibits themselves but in the demonstrations which accompany them for the purpose of explaining some good methods of doing things.

Various departments of the state had gone to great trouble and expense to show the fair visitors what is being accomplished for state welfare. The state health department, the department of correction, the department of mental hygiene, the state college of agriculture, the state experiment station, even the fair itself under the supervision of the department of agri-

culture and markets had representatives to explain their services and the fine displays of work in the exhibits.

Eight county home bureaus exhibited, each taking one certain topic which had been a project in the county and using it as a theme for the exhibit.

Delaware County's exhibit showed the great variety of uses to which whole wheat might be put, not only plain bread and rolls, but fancy muffins, cakes, cookies and delicious healthful sweets of many kinds. The health-giving qualities of whole wheat were emphasized by placards.

Wayne County whose exhibit of the hooked rug craft won second place, showed how a most artistic and useful rug may be made from old clothes. Artistic design was emphasized as well as the need for utilizing what one already has on hand. A suitable setting of furniture in the colonial "spirit" helped to show how such rugs can be used most effectively. The tools used for making rugs were on display, a simple frame and a stout needle with a hook much like a crochet hook.

Ontario County had one of the most difficult topics to portray, that of "Organization" showing how the home bureaus link up the farm women to county, state and federal governments. It was done very cleverly in the modernistic manner by using silver patches of paper against a background of black muslin. Necessary relief was given by flower stands and jars of cut flowers.

Yates County's Convenient Kitchen offered a solution of kitchen problems of arrangement for convenience and good looks. Ivory and apple green formed the color scheme which was adhered to in every detail as far as possible. Plenty of working space was provided on table tops, two drain boards and cabinet shelf. Cupboards were right where supplies or equipment would be used most often. A reasonable amount of labor-saving equipment was included, pressure cooker, iceless refrigerator, etc.

Genesee County's exhibit used placards and tables set with the proper combinations of food to show what people should eat whether they be large or small, old or young, sick or well.

Onondaga County's booth demonstrating good selection of furniture took first place. Every piece of furniture, every hanging, the rug on the floor, the cushions on window seat and chair formed a part of a pleasing picture. One of the tables, the desk and a chair or two had been refinished at

(Continued on Opposite Page)

Table Mats in Chinese Design

The design of these charming little table mats is Chinese in origin, and it is furnished already stamped on excellent quality black satin, not sateen. Colors in the rope silk for embroidering are silver-gray, and gold color, a bit of rust-red and brilliant turquoise blue.

Number 566 is round, 11 inches in diameter, while number 567 is shaped for the end-table, about 8 by

13 inches outside. Each of these two patterns includes the stamped satin, a color chart for working, a lining, and of course full instructions for making. We also include enough thread for embroidering complete in the right colors. Either mat will be sent for \$1.00 postpaid. Address Embroidery Dept., American Agriculturist, 461 Fourth Ave., N.Y.C.

The State Safeguards Public Health

But Often the Public Does Not Know How It Is Done

WHEN inquiries have come to us from readers about health matters which involve the cooperation of state health departments or any of their divisions, we have always found the departments willing and even eager to serve the public. The trouble seems to be that often those who most need such services do not know how to obtain them. We are always glad to assist in putting our readers in touch with the proper department and hope they will feel free to come to us when they need us. Yet precious time might be saved if it were known that in every state there is a state health department at the state capital and one of the important divisions is that of Maternity, Infancy and Child Hygiene. Most states have consultant nurses as well.

Here is an example of what one state is doing to help its prospective mothers safely through the ordeal of childbirth. This letter went in reply to our inquiry which, in turn, was a result of a letter from one of our subscribers who needed such care and yet had no money to pay for it. We do not intend to convey the impression that free hospital service is available to all. Private hospitals have to depend largely upon fees in order to keep going and sometimes the state hospital is too far distant or too crowded to serve the purpose. However, it is good to know all the possibilities in case hospital care is necessary.

"My dear Mrs. E....

Your inquiry sent to the Household Editor of American Agriculturist, has been referred to the above Department, and we shall be very glad to extend any help to you that may be needed.

I have asked the State Nurse, Miss N.... S.... to see you, and hope she can give you some practical help.

The B.... State Hospital will take care of you without charge if you are unable

to pay. The R.... P.... Hospital will also do the same under similar circumstances. If you are in a locality that is quite inaccessible to these hospitals. I would suggest that you ask your family physician or any other doctor about having you admitted some days before the baby is due in order that you may feel sure of adequate care at that time. I am interested to know what care you have had

Clever Frock

2900

Dress pattern No. 2900 with its fluttering skirt ruffles and side draped effect of bodice is delightfully designed for dresses of chiffon or printed silk. For fall wear the beige brown tones are most attractive. The pattern cuts in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4 yards of 40-inch material with $\frac{3}{8}$ yard of 36-inch contrasting. Price 13c.

up to the present time and I hope you will be quite frank with Miss S.... in telling her your needs.

Have you been to any doctor at all? What about a urine examination? How are your teeth? What about your food? All these are very important items in your present condition. If you will give me all this information at your earliest convenience I assure you our Department will be interested in helping you to obtain the care you may need.

Very sincerely yours,

E..... M.....

Nursing Consultant

P. S. We know of no maternity home in your vicinity.

Women's Interests at the Fair

(Continued from Opposite Page)

very little expense by the women who owned them. The rest of the furniture was new, but had been chosen along the lines of the old pieces. The lamp shades had been made by women and were definite additions to the scheme of the room. A bit of printed cotton in charming design and color hung above the desk and the window drapes in their golden color repeated the color note of the cotton print. The rug was of an inexpensive variety but just right in color. Truly, the booth showed that selection of furniture and furnishings is the prime essential in making a beautiful room.

Allegany County's booth with its display of the right kind of clothing for children took third place. There were play clothes which did not weigh down

their wearer, there were school clothes for rainy or for sunny days. But not only were there all kinds of suitable, attractive clothing, but there were little clothes closets or hangers so little folks could take care of their own clothes.

Chautauqua County's Child Guidance exhibit showed how the right sort of recreation could be provided for children by careful selection of books, toys for the builders, for mother's little helpers, for outdoor or indoor play and for special muscle development.

The plan for girl junior project workers was slightly changed this year. Demonstrations were given but not in contest as before. They were more for the purpose of teaching a new project to girls from counties not having that particular project. As usual, however, there were competitions between exhibits of clothing, foods and canned things made by the girls and sent in to be judged. The attendance of boys and girls was as large as ever.

Since women are grange members and usually have a lot to do with grange exhibits they will want to know which granges exhibited farm produce and how they were placed:

North Manlius—1st prize; Baldwinsville—2nd prize; Marcellus—3rd place; Cicero—4th place; New Woodstock, Red Creek, Cazenovia.

This counts most . . . Save yourself!

Penny by penny, you save on household things. But on washdays, it pays best to save yourself. With Fels-Naptha, you get what you need most—not more bars, but more help. The extra help of two safe, active cleaners, brought together in one golden bar. Naptha, the dirt-loosener (smell it!), and good golden soap, the dirt-remover. Together, they work to make your washing easier . . . to save you. Buy Fels-Naptha today . . . at your grocer's . . . you owe it to yourself.

Nothing can take the place of

Sold... 15 Tons of Straw

A Bell System Advertisement

A FARMER near Ithaca, New York, wanted to have his straw baled, provided he could find a place to sell it. He drove here and there in his car, making inquiries. No one wanted to buy. Then he thought of a man who used straw in considerable quantity. He stepped to the telephone and called him. He sold him 15 tons, then and there.

A farmer living in Grant County, Ind., started to sell 75 hogs, but thought it might be wise to telephone and see if prices were firm. Prices had dropped $\frac{1}{8}$ c. He held the hogs and got a $\frac{3}{4}$ c increase.

There is no friend quite like the telephone when emergency threatens, whether fire, injury, sickness or thieves. But it is also valuable in the day-to-day duties of life—running errands to town, bringing spare parts when a machine is broken, calling neighbors and friends, finding where to buy or sell for the best price.

The modern farm home has a telephone.

The Plains of Abraham—By James Oliver Curwood

He was at home, in the valley. The apple trees were about him and the sun was shining and he was with his mother. They were seated under a tree, resting from their labor of picking up cider apples while his father drove a cartload of fruit down the slope. He could hear the creaking of the wheels. Close to the cabin his Uncle Hepsibah was working the cider press. His mother's head touched his shoulder, and he could feel the softness of her hair against his face. Then they were laughing at a chipmunk who came to stare at them with his cheek pouches so full of corn that he looked as if he had the mumps. Quite unexpectedly, a black cloud shut out the sun and everything was obliterated in darkness. When this happened he seemed to be holding his mother from some force which was trying to drag her from him. This darkness came and went, and the odd part of it was that his father and Uncle Hepsibah did not move from their original positions—one was always halfway down the slope with the ox cart and the other was working at the capstan of the cider press. The chipmunk continued to stare at them with his mouth full of corn.

With an effort, Jeems roused himself from his dream. He saw Odd at his feet and beyond him a clump of briars, a tangle of long grass, an overgrown clearing in which there were no apple trees, no home, no Hepsibah at a cider press. It was Lussan's place. Day had come, and the sun was rising. He sensed these things first, in a flash of wakefulness, and then felt a weight against him and the softness of his mother's hair on his cheek. Only it was Toinette and not his mother. She must have come to him before the dawn broke. Her head was resting on his shoulder and his arms were about her as they had been about his mother. His movement had not awakened her, but now a slow tightening of his arms brought a tremor to her lashes and a deeper breath to her lips. He kissed her pale face, and her eyes opened. He kissed her again, and the act did not seem to disturb her any more than it amazed or shocked him. There was a responsive greeting in her eyes.

Then she sat up straight beside him and faced the rising sun.

The air was so cold that she shivered. Every shrub and briar and blade of grass in the clearing glistened with frost. The coat she had brought from the house slipped from her shoulders, and Jeems drew it about her again. They stood up, and strength returned into their cramped limbs. For a little while they did not speak. They heard a boastful blue jay screaming half a mile away, and in Lussan's meadow crows were gathering. A woodpecker drumming at a hollow stub made the sound of a man with a hammer. Sounds carried far in the silvery sun-streaked mist which lay between the earth and the sky.

That they belonged to each other was a truth which pressed itself on them without effort or confusion. Toinette was not ashamed that she had come to him nor that her act had proclaimed what pride and false prejudice had so long hidden from him in her heart. Her eyes glowed with a light which shone softly out of fathomless depths of pain and grief. She wanted him to know how completely the folly of her pride was gone and how glad she was that it was he who stood beside her now. They might have been years older, so calmly did the sense of surrender and of possession hold them. Except for the new tenderness in her eyes,

Toinette was unchanged. But Jeems felt himself taller at her side and something had entered him which was like the spirit of a conqueror. It was another world now. A vast mystery ahead of him. Something to fight through, to win from, to live for. Mysterious, it was still very real. It set his heart throbbing with an unappalled and challenging force. Yesterday, black with tragedy and grievous with its pain, was a long time ago, but, with Toinette, to-day had become a tremendous living present. Gently her fingertips touched his shoulder. Then she looked

seconds a look had come into Jeems's face like that which had frightened her in the tower room of the mill, a look hard and vengeful with the desire to kill.

"Jeems, dear, we must hide," she pleaded. "We must hide!"

The futility of trying to conceal themselves when their footprints were clearly left upon the frosty ground did not occur to him at once. It was her voice and the name it claimed for him that broke down the resolution which soon would have betrayed them.

"I know of a place," she was saying.

Bringing the Story Up to Date

JEEMS BULAIN with his French father and his English mother lived in colonial times near the border between Canada and the English colonies. Their neighbor, Tonteur, is their friend but Madam Tonteur hates Catherine Bulain because of her beauty and her English blood and tries in every possible way to teach her daughter Toinette to hate Jeems Bulain.

Catherine Bulain's brother Hepsibah who is a trader pays them a visit. After supper he opens his pack and among the presents he has brought is a beautiful piece of red velvet cloth for Jeems to give Toinette. Jeems attends Lussan's auction the next day and resolves to give Toinette his present and to whip Paul Tache. Paul is the victor in the fight. That evening Hepsibah tells Jeems of his fears that war between the French and English is inevitable.

Toinette leaves to attend school at Quebec and is gone two years. During this time the cloud of war draws nearer and Jeems develops into a strong, resourceful youth. Toinette returns home but refuses to speak to Jeems. Friction between the French and English grows steadily worse and there are rumors of war and massacre. One day Jeems takes a trip to Lussan's and as he returns just at dusk he finds his home on fire.

Jeems finds his father and mother dead and scalped by Indians and later finds Tonteur Manor also burned. He finds Toinette unharmed by the raiders. She bitterly denounces and then tries to kill him. When Toinette learns that Jeems' parents are dead she asks for forgiveness. They start for Lussan's place because Indians avoid abandoned houses.

with him toward the east and the Richelieu—and what lay beyond.

From the moment they had risen to their feet, Odd had stood as rigid as carven wood in the white-coated grass with his muzzle levelled toward Lussan's meadow. Something definite had come within his reach, which made it unnecessary for him to measure the wind, and suddenly there rose above other sound the wild and raucous crying of a blue jay, and a cawing of alarm among the crows. Black wings flashed over the tree-tops, and Odd's gaunt body quivered as he watched them disappear. A second and a third blue jay joined the first, and their tumult came to an end when a piercing bird call terminated sharply in a single screeching note.

"That was an arrow," said Jeems, beginning to string his bow. "More than once I have had to kill a noisy blue jay when creeping up on game."

He drew Toinette into the shelter of the house and called Odd. A few minutes later—swiftly moving, sombre horrors in a world of shimmering white—they saw the Mohawks come out of the edge of Lussan's meadow.

CHAPTER XIII

THE spectacle of death marching back over its trail brought no terror to Jeems. He had watched for it, had half expected it, and in a way it was like the answer to an unvoiced prayer which had followed his awakening when he had found Toinette in his arms. To fight for her now, to rush forth from the house with a battle cry on his lips, and to be cut to pieces in her defence was not a prospect which dismayed him, but which, instead, inspired in him a fearless exaltation. It was Toinette who saved him from whatever folly was brewing itself in his brain as he stood with a long hunting arrow fitted to his bow. With a breathless cry, she drew him away from the broken door, and there, safe for a moment from the savages who were entering the clearing, she flung her arms about his shoulders. For in these tragic

"We must hurry to it!"

She ran ahead of him and he followed her into another room where a stair was falling into ruin. A bit of sun splashed on the floor, and though the paneless window which admitted it they caught a glimpse of the Mohawks. The red killers had paused at the edge of the open. They stood motionless, like stone men, listening and watchful, the upper parts of their bodies still unclothed until colder days and glistening with grease and paint. Toinette did not allow Jeems to pause, and the steps made complaint as they trod upon them. Jeems looked down from the top and saw the marks of their feet in the dust below. Their fate was certain if the Mohawks came this far, but with only the narrow stair for their enemies to ascend he was determined, in this event, that each of his twenty arrows should find a home.

Toinette preceded him into the room above. She went directly to a panel-like board which held a wooden peg and in a moment they were peering into the musty gloom of a huge black hole under the roof, which the Lussans had used as a garret. Mice scampered about as the first light of years impaled the darkness.

"Madame Lussan brought me to this room after your fight with Paul," she whispered. "I flung my spoiled clothes far back in there!"

Even with the savages so near, pathos and memory were in the tremble of her voice.

Jeems faced the narrow aperture in the wall which Lussan had left as a window and a gun-hole for defence. Yesterday—Paul Tache—Toinette, the little princess with her riding habit and lustrous curls—and now just they two alone in the room where she had hated him so desperately! He went to the window, and Toinette came close to his side. No eyes could see them as they looked through the rectangular slit shadowed under the eaves. The sun had not risen high enough to direct its warmth effectively upon a whitened earth. The clearing was a

paradise made by sprites and nixies out of jewelled frost, with trees about it in gold and white, and thick hazel clumps transformed into glowing polychromes of fringy petalled yellow. Deeper into this scene of purity and beauty the Mohawks had not moved, and from the steadiness of their attitude Jeems knew they had come upon the open unexpectedly. A dozen warriors stood revealed outside the bordering thicket, and twelve pairs of eyes were fixed upon the abandoned house in a tense and suspicious scrutiny. Yet not a hand among the silent savages had moved to hatchet, bow or gun.

This fact drew a hopeful whisper from Jeems.

"They see the place is deserted, and unless they find some sign of us, they won't come nearer," he said. "Look, Toinette! There is a white man among them with a prisoner's collar around his neck—"

His words were cut short by a sudden movement among the watchers, as if a command had stirred them to life again. The man in the lead, with three eagle feathers in his tuft, stalked alone into the clearing, a tall and sinister figure burdened only with his weapons and a warrior's diminutive traveling pack—a giant who was red and black and ochrish yellow in his war paint, and at whose belt hung a bundle of scalps in which the sun played and danced with changing lights as he moved. These horrid objects, one of which was a woman's with hair so long that it could not escape the eyes of those who were in the house, wrenched a shuddering cry from Toinette, yet even then she thanked God it was as fair in colour as the day itself and not the gleamy cloud of darkness which might have been Catherine's. Faintness swept over her, and she closed her eyes that she might shut from her vision the grisly trophies of a warrior's success. When she opened them again, two score warriors in single file were following in the footsteps of the leader and passed within a hundred feet of what once had been Lussan's home, casting furtive sidewise glances as they went. In more than one belt, fresh scalps shown in the sunlight, and two white men and a boy with their hands tied and prisoner thongs about their throats walking in line. A little more to the right, and the presence of other things than emptiness and ghosts must surely have been discovered by the Indians, for from their window Toinette and Jeems could see the tell-tale imprints of their shoes in the white frost dangerously close to the thin straight line of their enemies.

Not until the trees on the other side of the clearing had swallowed the last of the Mohawks did Toinette's straining eyes turn to Jeems. There had been no sound in the passing of the red scourge, no cautious voice, no clatter of wood on steel, no crackle of brittle grass or weeds under fourscore moccasined feet. Where their tracks lay in the grass, one might have thought that three men had travelled instead of forty. And the world was dead behind them. Crows did not return to the meadows, and the blue jays had flown into safer distance. The woodpecker had gone to a farther stub. Even in the old house there was no longer the scurrying and squeaking of mice—no sound but the tumultuous throbbing of three hearts, two of them human and one a beast's.

It was then Jeems spoke.

"I swear there was a white man—a free white man—in that painted crowd, and long hair was hanging from his belt," he said.

HANDY ANDY Says "Here's How"

To Make Good Silage Without Tramping

By Ray Inman

Barnyard Golfers Make Records at Syracuse

(Continued from Page 5)

ried off most of the money.

It had been agreed by the entrants before the tournament began that if there was a tie for the championship, as there was between Miller of Delaware County and Holzhauser of Saratoga County in 1927, it should be played off in one 50-point game but for the money and place below the first the total number of points made by each contestant should decide the tie in games if any.

Turk, Brain and Albertson tied for second place in games won but as Turk had the highest number of points he was given second money and place and as Brain had more points than Albertson he was given third money and place. Turk's 12 points more than Brain were worth \$10. to him or almost a dollar a point. The 8 points that Brain had above Albertson were worth to him \$10 or \$1.25 per point and the 20 points that Albertson was below Turk lost him \$20. The moral is to pitch every shoe as carefully as though the highest money depended on that shoe.

Of course, the money won came handy for each winner, but the love of the sport and the desire in all respects to follow the rules of good sportsmanship seemed to be the controlling factor through all the games. No finer compliment could be paid to all the men than to say what is the whole truth, that each one tried to follow out the teachings of the golden rule in all their relations with each other. The record made by Shackleton, last year's champion, of 10 double ringers in one 50-point game was not equalled this year, but Adams, Albertson and Brain each pitched games in the finals in which they made 9 double ringers.

After the tournament games had been completed and the records compiled and verified, Earl Flansburgh, assistant county agent leader, speaking for the Farm Bureaus, told why the county agents are interested in helping to conduct the local county contests and to extend interest in the great game of horseshoe pitching. Then E. R. Eastman, editor of American Agriculturist, made a brief statement to the crowd about the meet and in a few well chosen words after the writer read the record made by each man, he awarded the prizes. Fifty dollars and the championship gold medal suitably engraved went to Mr. Adams of Chenango County; \$40. to Mr. Turk of Chataqua County; \$30. to Mr. Brain of Cattaraugus County; \$20 to Mr. Albertson of Ulster County; \$10 to Mr. Beardsley of Tompkins County and \$5. each to Mr. Pickard of Cayuga County and Mr. Ritz of Orleans County.

This is the first year that this tournament has been pitched on clay courts. These courts were permanently installed by the State Fair this year and will be used each year hereafter. Mr. G. E. Snyder, Albion, N. Y. had charge of the building of the courts and also the placing of the players as their names were called during the tournament. The writer had charge of the records and was assisted by Mr. Earl Hummell of Albany after the eliminations.

The men who lost out in the eliminations and some of their friends, did fine work in keeping score and marking the points of each player on a blackboard after each inning so that the crowd knew all the time how each game stood.

Mr. Leon E. Brown, Norwich; Mr. S. W. Hagen, Mannsville; Mr. C. E. Staples, Marlborough, and one or two others whose names the writer did not learn, did most satisfactory work as referees, being called frequently to decide some close point which they did without a complaint from any player. Last year some of the players were handicapped because they had been practicing on clay courts and had to pitch in the tournament on dirt courts. This year just the reverse was true because quite a good many players had never practiced on clay courts and found that they could not slide their shoes in clay as they had been in the habit of doing on dirt courts. A great many expressed themselves that they were going home and install clay courts for practicing on in the future. All expressed themselves as liking the clay

courts and were sure that they would be used to them if they came again next year. Dirt courts make players almost unconsciously careless pitchers. The clay on the courts this year was kept at about the consistency of putty by the ground keeper who kept working the clay over and wetting it when the courts were not in use.

The complete results of the finals are given in Table B. At the bottom of Table A the preliminary totals of the three previous tournaments in which preliminaries have been played are given. It will be noted that the average ringer percentage of the sixteen men that played in the preliminaries each year has increased from .208 in 1926 to .311 this year. Under Table B is given the average percentage of the six men that have played in the finals in the three previous years. This percentage has increased from .226 in 1926 to .361 this year. Also under Table B is given the grand total of all entrants in these tournaments since 1924 when the first tournament was held. The average percentage of ringers to shoes pitched that year was only .077 while it has been increasing each year until in this tournament it had reached .333 or more than four times as much in six years.

Without any question the tournament this year had the best pitching talent that has ever competed at the State Fair and was the most satisfactory from every standpoint that has yet been held. The players and all connected with the management are greatly indebted to the American Agriculturist, the Farm Bureau and the State Fair for the complete arrangements that contributed to such a successful meet.

The Plains of Abraham

(Continued from Page 4)

"I saw his blond head and lighter skin, but thought my eyes were lying to me," replied Toinette.

"An Englishman," said Jeems. "A murderer for money such as my Uncle Hepsibah told me about."

"And yet—he might be French."

They stood looking into each other's eyes, she of the aristocracy of Old France and he of the New World's freedom, and her hands rose slowly to his face as his bow and arrow fell to the floor. For the first time she raised her mouth to his.

"Kiss me, Jeems—and pray a little with me in gratitude for the mercy God has shown us!"

The thrill of her lips lay for a moment against his.

"I am sorry for everything in the world," she said.

Some of the softness and beauty of boyhood returned into his face as she drew herself from his arms and he descended the creaking stair ahead of her.

They did not go out at once, but stood near the lower door, listening for sound and watching for something to move, while Odd kept his eyes on the forest walls of the clearing. The sun rose higher, and before its devastating warmth the fragile structures of the frost builders crumbled away, fairy cities and kingdoms giving place to the more colourless blankets of autumn. Not until then did the earth seem to live again. A cheery group of chickadees settled among the bushes, and red-squirrel's feet pattered across the roof of the house. The woodpecker was back at his old tree, hammering and digging to get at a grub. Odd moved and heaved a sigh as if he had begun to breath freely once more, and when the throaty, chuckling song of the red-squirrel sounded over their heads, Jeems drew his gaze from the open.

"They are gone," he said. "But there may be stragglers behind, and it is safer not to show ourselves too soon." (To be Continued Next Week)

The scientifically accurate way to load shells

WHEN you buy shotgun shells, forget everything but the kind of game you are going to hunt. Tell your dealer you want a Remington Game Load designed especially for that kind of game.

There is a Remington Game Load for every kind of game hunted with a shotgun in North America. These loads represent the combined experience of hundreds of thousands of sportsmen.

Experience in the field developed the ideal characteristics for each load-velocity, penetration, pattern, size of shot. That is loading for exact results rather than with a fixed amount of powder. They are more uniform than loads with a specified amount of powder, because two lots of powder are seldom alike. The Remington Game Load principle furnishes the scientifically accurate method of loading shotgun shells.

The Service Bureau

A Department Devoted to the Interests, Welfare and Protection of A. A. Readers

Washington Auto Service Co. Active

"Will you please inform me on the Washington Automobile Service Corporation of Newark, N. J. I have a receipt for \$29.75 paid in full for an automobile insurance for two years and should get my policy the latter part of this week. I am wondering if it is all right and if so will it cover the new law in full?" New York.

THE money which you paid to the Washington Automobile Service Corporation was not paid for an insurance policy and if the agent intimated to you that he was selling you an auto liability insurance policy he was badly misrepresenting the situation. The Washington Automobile Service Corporation is one of a number of companies that have been very active for several years in selling what is known as

years ago by the Postal Inspector at Austin, Texas, and that the U. S. Attorney declined to prosecute upon Browne's promise to refrain from mailing further circulars. Apparently Browne was unable to resist the temptation.

Taking a Flyer in Airplane Stocks

ALTHOUGH there are a good many companies manufacturing airplanes whose securities are good investments, the fact that flying is becoming so popular and is growing so rapidly makes it an excellent field for questionable operators.

Recently, a temporary injunction was issued in favor of the New York Attorney General against Hadley & Co.,

New York City, restraining them from continuing alleged fraudulent practices in the sale of stock in the Crescent Aircraft Corporation.

A temporary injunction obtained by the Attorney General against the New Age Industrial Corporation of Syracuse is still in force.

Real Estate Sharks Active At Boulder Dam

We recently received some literature advising us to purchase lots near the site of the Boulder Dam. Claims were made that these lots will be very valuable when the Dam is completed.

THE publicity which has been given to the Boulder Dam project by newspapers has made a very favorable situation for land speculators. It is estimated by experts, who are familiar with dam construction, that water for irrigation will not be available for possibly twelve or fifteen years. It is also estimated that while there are seven million acres of vacant government land in southern California, that at least 90% of this land will never be irrigated. It is stated that one concern alone recently defrauded nearly one thousand residents of California

by selling them lots at an elevation of 1200 to 1400 feet above the river and which could not, therefore, by any possibility, ever be irrigated.

The best advice we can give our readers is never to buy real estate without first giving it a personal examination.

We "Stuck" to This One

We received a check for \$40.00 from the —Co. for which we thank you very much indeed. We have had sickness in the family and I can assure you that this money will be very useful to us.

THIS letter tells of the final settlement of the claim which we have been handling since last May. Fortunately, the company involved was entirely reliable. Our subscriber had shipped a hide to this company which was in a truck accident and was lost. The company claimed that they had sent a check in settlement for it but we were able to convince them that settlement had not been made and then they were very glad to send a check to our subscriber. The harder a claim is to settle the more satisfaction we get when we forward a check to a subscriber.

Not An Insurance Policy

EVERY mail brings at least one inquiry from a subscriber in various sections of the state, as to the standing of the Washington Automobile Service Corporation of Newark, N.J. Evidently salesmen of this firm are canvassing again in an effort to obtain new memberships. Several subscribers have understood that the membership includes an insurance policy which meets the provisions of the new New York State Insurance Law.

If any of our subscribers have signed up as members of this organization and have secured or understood they were to secure any type of insurance policy in consideration of a service fee, we would be glad to hear from them.

an automobile service contract, mainly to rural residents. Although these contracts differ somewhat, in general they offer rebates or reductions on gas, oil, accessories and repairs as well as free towing service in case of accident and in some cases a certain amount of legal help which is usually surrounded by a number of qualifications which may make the service of doubtful value.

The American Agriculturist Service Bureau has had hundreds of letters from subscribers who have invested or who are contemplating investing in schemes of this sort, but we have yet to hear from a single subscriber who has invested and who has felt that he has received his money's worth. In many cases they report that they have received absolutely nothing for the money they have spent.

The new New York State Law which goes into effect September 1, is not, strictly speaking, a compulsory insurance law. The law does require that following an accident for which the driver is responsible or following conviction for one of several offences against the Motor Vehicle Law that a driver will have his license suspended until he can show financial responsibility. One way of showing financial responsibility is to have an insurance policy which protects anyone who may be injured or whose property may be damaged through accident caused by your car.

The "policy" as you call it, which you are expecting from the Washington Automobile Service Corporation is not an accident liability insurance policy and will not in any way meet the requirements of the new law which became effective September 1st in New York State.

A Lot of Money—If You Get It

A NUMBER of people near Rochester have been approached by Leo C. Browne and asked to share in a possible one hundred million dollars or more yearly profits from his sisal industry. We understand that Browne's activities were investigated about three

A Farmall Owner writes to his McCormick-Deering Dealer

[the Forbes Co. of Hopkinsville, Ky.]

An experienced power farmer gets a new surprise in the FARMALL.

"It paid for itself 2 or 3 times over in 1928"

His FARMALL cultivates 105 acres in 3 days—and 50% better!

He says, "More work done — more money in the bank for everybody!"

The many lines of McCormick-Deering power and equipment are at every farmer's service! Write for catalogs and see the dealer.

"Gentlemen:

"I want to express my thanks for the kindness and help rendered me when you sold me the Farmall Tractor.

"I had told you that I could not farm without a tractor but could not think that the Farmall would do all that you recommended it to do.

"But after seeing the Farmall do the work, I at once became interested and bought. I want to say to you that this tractor has already paid me big interest on the investment. It paid for itself some two or three times over in the 1928 crop. I understand that you now have Farmall equipment to do most any job on the farm. I am going to get a mowing machine and the sweep rake, and am thinking now of buying another Farmall this year.

"Last year I cultivated 105 acres of corn in three days and did it about 50% better than I could with my teams. No one will go wrong in buying a Farmall. It is the real 'farmer's friend' of today, and I believe that when more of the farmers buy the Farmall and use it there will be more work done and more money in the bank to their credit.

"I again want to thank you and will always appreciate it, as I am in so much better condition financially than before. I also want to say that the International Harvester Company is doing more for the betterment of the farmers than any other concern I know of."

Very truly yours,

D. L. VAN CLEVE,
Hopkinsville, Ky.

FARMALL

Farming in Bermuda

(Continued from Page 2)

not mean improperly made Bordeaux or free arsenic. It meant that the salt sea-spray in tearing gales would be carried to the center of the island and falling on potato foliage where the tissues have been broken by the wind gives rise to an injury that might easily be mistaken for tip-burn. Bermuda has about all the insect and fungus pests known to science but strange to say, I am told the American potato bug has never gotten a foot hold.

Then there is celery. Forty years ago in America a man named Greiner published "The New Celery Culture" which in a word was the plan of setting the plants so closely that they crowded each other and blanched themselves by their own shade. Somehow or other the idea never seems to have been a success with us but I found all Bermuda celery grown on this plan. The plants are set 10 inches apart each way, which gives about sixty thousand plants per acre. They assured me they had tried all distances and this was the best one. The celery I saw was of very large size and fine crispness and flavor. This celery received a couple of "side dressings" of nitrate of soda and castor pomace during the growing season. This is applied by hand, men going through these narrow ten inch rows to scatter it. I talked at length with one grower who was applying castor pomace. We arrived at the conclusion that he was putting on at this dressing about 1800 pounds per acre. The cost of this particular material was about \$38.00 per ton. It costs real money to take care of the fertility problem for this intensive type of truck growing.

Paul, the Hebrew, was a most voluminous letter writer in his day and not infrequently he employs a figure of speech saying "But time would fail me to tell of—" after which he proceeds to mention a rather imposing array of topics.

So time would fail me to write as fully as I would like concerning Bermuda. I think I must be one of those people with whom a little travel goes a long ways. In any case, eight days among Bermuda farmers has given me an amount of subject matter beyond what the Editor is willing to publish. He tells me that travels in Bermuda do not "go as well" as tales about Old New York Villages or Hill Country farms.

So time—or rather space—fails me to write of the Bermuda lilies and onions and carrots and parsley which are exported and bananas and strawberries which are consumed at home.

I would like to write of their dairying for the island has some 1200 cows and milk sells for about three times the going price of the New York Milk Shed.

Then there are about 1500 horses and thousands of bicycles, eight road trucks and one motor ambulance. You are in no danger of being run over by an automobile but possibly on the main street of Hamilton you might be trampled to death under the feet of horses.

I wish I could tell of the almost universal architecture of the island houses built of solid blocks of coral—(each one sawed as perfectly exact as a pressed brick) with the roofs made of slabs of coral an inch and a half thick cemented in place with the lime of the island.

In a word my terminal facilities are wonderfully poor.

But in any case—even if I can't tell it all to the readers of the A. A.—I shall always have golden memories of the lovely islands where I was for a little time a casual visitor.

On the Willson Brothers Dairy Farm in South Windsor, Conn., Socony products are used to operate this harrow as well as many other kinds of farm machinery.

For Harvesting the Crops of New York and New England ... you'll find Socony on the job

From the fruit farms of Western New York and the dairy farms of Central New York and New England, to the potato farms in Maine and Long Island, you'll find Socony products operating tractors, trucks, harrows, reapers, harvesters and other farm machinery.

Many thrifty farmers start their equipment with Socony Special Gasoline because it insures quicker starting, greater power and fuel economy.

For lubricating this machinery they are using Socony Aircraft Oil and the recommended grades of Socony Motor Oil.

Among the products we make especially for farm work are:

Ruddy Harvester Oil	Eureka Harness Oil	Standard Hand Separator Oil
Socony Household Oil	Socony Turex Oil (For Diesel and Oil Engines)	
Mica Axle Grease	Socony Disinfectant	Socony Motor Oil
Socony 990A-Motor Oil for Model A Fords		Socony Gasoline & Special Gasoline
		Dendrol Dormant Spray Oil

Call of the Children

It is, indeed, true that the children, even more than the mother, are dependent on the father, who must recognize this by making due provision for the little ones in case he is called away.

This he generally does through insurance protection, and many fathers have made and are making such provision by arranging a policy in the

Postal Life Insurance Company

Insurance in force, \$56,000,000
Resources, \$20,000,000

The contract thus taken out is approved by the State Insurance Department and may be Whole-Life, Limited-Payment Life: Endowment, Joint Life, Child's Welfare or a Monthly Income policy under which the Company pays a stated sum each month, generally to the mother, to take care of the children when they are growing up, and in many cases the mother herself takes out insurance for their protection.

In either case the Policy wisely provides

Help When Most Needed

The result is that the father and mother who thus look out for their family cannot fail to be always held by them in grateful remembrance, while those who fail thus to provide—well—it is enough to say that hardly any situation could be more serious.

It is well worth your while to have the POSTAL tell you about the different policy-contracts that can be issued as

Protection For Those Near and Dear to You

Call at the Company's office or write as follows

Saving Old Landmarks

In Herkimer County - Home of Owen D. Young

THIRTY years in the life of a little country hamlet can make many changes. From mud roads to concrete, from oil lamps to electric - from a general run-down condition to a street where every home seems to vie with its neighbor in the care of its lawn and flower garden, where pleasure parks replace neglected vacant lots, where everyone seems to enjoy living, this is Van Hornesville, the birthplace and home of Owen D. Young.

Leaving the Mohawk Valley Turnpike, Route 5, at Nelliston, following Route 80 through Fort Plain, over fine roads winding through wooded hills for about 12 miles, you reach this quiet spot among the hills of Herkimer County. Entering the village from the east on your right is the new school built by Mr. Young. This is one of the finest school buildings in the state. The building is built of stone, selected by Mr. Young, and some of it was drawn for miles, the colors blending into a perfect color scheme.

A Home for Teachers

The building is perfectly equipped with all modern improvements, and nothing has been overlooked for the comfort of the children. Across the street Mr. Young is building a home for teachers. Of course, this will be a model home when completed. On the hill opposite is a unique club or community house, the building and fixtures nearly one hundred years old - this also has been remodeled by Mr. Young. "Remove not the ancient landmarks, which thy fathers have set."

Next we come to "Young's Park", once a neglected vacant lot. A little farther up the street is the home of Mr. Young's mother, an ideal country home shown in the illustration on this page. Opposite is the children's playground, also used for picnics. The old village cemetery on the hilltop, beautifully kept is the resting place of some of the pioneers of Herkimer County. Here also among the wooded hills rests the young son of Mr. Young. At the rear of the cemetery Mr. Young has erected a fine memorial, with a window designed from the scenery of the valley, with its hills and streams.

At the upper end of the village is the stock farm owned by him. Here you will find about 100 thoroughbred Holsteins, one of the finest herds in Central New York. Mr. Young owns over 1000 acres around the village and is planting out acres of fruit and shade trees. I think that part of his success lies in giving the "other man" his full share of praise. In one of his recent articles on "What is Right in Business" he quoted from Emerson these words—"The habit of directing large affairs generates a nobility of thought in every mind of average ability. The affairs themselves show the way in which they should be handled, and a good head soon grows wise and does not govern too much."

I asked one of the village residents how much the new school building cost. His answer was "No one knows, and never will know, by his telling." A man of determination and clear vision,

Owen D. Young started out to do something for himself and others, and he has done it.—E.S.G.

Prices Our Grandparents Received

I RECENTLY took the following prices from an old diary which I found. I thought that these prices might be of interest to your readers:

Horses sold for	1864	\$135.00
Cows sold for		20.00
Buckeye Mower sold for		115.00
Turkeys dressed sold for, per lb.		.12
Butter sold for	1865	.25, .30 and .40 per lb.
Bran sold for		\$1.00 per 100 lbs.
Tea sold for, per lb.	1867	\$1.75
Butter sold for, per lb.		.28
Wheat sold for, per bu.		2.25
Sugar sold for, per lb.	1871	.13
Tea sold for, per lb.		1.25
Crackers sold for, per lb.		.10
Molasses sold for, a gallon	1877	.50
Sugar sold for, a lb.		.10
Sugar sold for, per lb.	1898	.06
Eggs sold for, per doz.		.13
Hay in barn sold for, per ton		5.75
Maple sugar, sold for, per lb.		.09
Butter sold for, per lb.	1899	\$1.18

—Mrs. C.L.B., N.Y.

Estimating Wind Velocities

HOW hard is the wind blowing? Ask any three people this question and you will likely get as many different answers. The Forest Service has worked out a method of estimating wind velocities as indicated by the effects on common objects.

A light wind, according to this scale, is one moving not more than 7 miles an hour. Direction of the wind is shown by smoke drift; wind is felt lightly on face; leaves rustle.

A gentle wind has a velocity of from 8 to 12 miles an hour and can be identified by the fact that it keeps leaves and small twigs in constant motion. Such a wind will extend a light flag.

Moderate winds blow from 13 to 18 miles an hour and raise dust and litter; small branches are moved and swayed.

Fresh winds have velocities of from 19 to 24 miles an hour and cause small trees in leaf (hardwoods) to begin to sway. Crested wavelets begin to form on inland waters.

In strong winds large branches or whole trees are in motion; one walking against the wind experiences inconvenience, and wind whistles in telegraph or telephone wires. The velocity ranges from 25 to 38 miles.

A gale, velocity from 39 to 54 miles an hour, breaks twigs off trees, generally impedes progress, and is likely to inflict slight structural damage on buildings.

A whole gale blows from 55 to 75 miles an hour, uproots trees, and does much structural damage to buildings.

Any wind with a velocity of more than 75 miles an hour is classed as a hurricane, and a description of the effects is not considered necessary as an aid to identification.—I. W. D.

The Young home in Van Hornesville, Herkimer County

New York's Fruit Prospects

Horticultural Society and State Department Get Estimates

EDITOR'S NOTE—As in past years, the New York State Horticultural Society and the New York State Department of Agriculture and Markets have cooperated to secure figures on New York State's probable fruit crop. The report which appears on this page is not an official government crop report.

FRUIT conditions were generally poor, except in the case of peaches, grapes and quinces, about September 1st judging from the report of 163 members received in time to be included in the accompanying tables. The Hudson Valley in particular suffered from a wet spring, accompanied by unseasonable freezes, followed by a severely dry summer. Most of the Lake Ontario section has also suffered from dry weather. The "condition" figures for "all varieties" of each kind of fruit are "weighted" by the relative importance of the different counties. The individual variety figures are simple averages. In using the figures due consideration should be given to the relative advancement of the crop compared with the same date in other years, to the probable size of the individual fruits, and to the factors that, during a given year, may cause improvement or deterioration, particularly with winter apples, after September 1st. These include such matters as scab, insects, drouth or excessive rain, severe storms, etc.

Apples: The prospects for apples, as indicated by the "condition" reports of members are for another light crop. Indications are generally the best in the Champlain Valley, poorest in the Hudson Valley from Columbia and Greene counties southward, and fair to poor in much of Western New York. The state average "condition" reported for all varieties is 44 per cent compared with 50 last September, 39 in 1927 and 73 in 1926. Fall varieties are 46 percent compared with 64 percent last September; McIntosh, on the other hand is reported at 41 compared with 30 last season. Baldwin, at 51 percent compares with 36 last September, 33 in 1927 and 64 in 1926; Greening at 28 percent is very light compared with 57 a year ago, although in 1927 this variety was reported at 22 per cent in contrast to 76 per-

cent in 1926; Northern Spy at 38 percent, the same as last year, compares with 49 in 1927 and 31 in 1926. On the farms of 117 members reporting expected production of winter apples of marketable quality 162,181 barrels are reported as expected this year compared with 182,565 barrels harvested in 1928 and 178,772 barrels harvested in 1927. In general, only the commercial apple sections are represented in these reports. In past years, the records appear to indicate that September 1 estimates of winter apples on individual farms of members have averaged somewhat under rather than over the final harvest.

Quality of Apples Poor

Quality is again disappointing, due to scab and aphid injury and drouth. For the state, members judged that 55 percent would probably pack "A" grade (this grade is not now in use, having been superseded by the federal grades, "A" corresponding, roughly to "U. S. No. 1"), compared to 57 expected at this time last year, 48 in 1927 and 71 in 1926.

There were only 24 reports on prices being offered by dealers for winter fruit, tree run. These ranged mostly from \$2.50 to \$3.75 per barrel depending on location and variety, with one report below \$2.50 and five reports above \$3.75, Hudson Valley and Lake Champlain figures generally running considerably higher than western New York. For Grade "A" packed, per barrel, 20 reports mostly ranged from \$4.00 to \$5.25, with three reports below \$4.00 and four reports above \$5.25.

Pears: Pears are again a light crop, the scarcity being most pronounced in the Hudson Valley, though light to very poor crops are generally reported in all parts of the state. Bartletts and Seckels are especially light. All varieties average 27 percent compared with 38 percent last year and 45 percent in 1927. By districts and varieties, the reports are as follows:

	State			Western New York			Hudson Valley		
	'29	'28	'27 '26	'29	'28	'27 '26	'29	'28	'27 '26
All Varieties ..	27	38	45 46	27	34	39 45	20	32	64 56
Bartletts	25	32	45 45	23	34	34 38	23	24	64 60
Seckels	21	44	44 35	21	52	38 32	15	35	58 40
Kieffers	30	44	44 52	33	41	41 49	19	44	47 60

Peaches: The "condition" reported averages

58 percent compared with 74 percent last September and 27 percent in 1927. Peach leaf curl in Western New York, and dry weather in both Western New York and the Hudson Valley helped reduce yields.

Quinces: Reported at 62 percent compared with 55 percent a year ago and 40 percent in 1927, this crop is apparently more abundant than in any season since 1925.

Grapes: Although the grape regions are not fully represented in these reports, the condition of 80 was reported compared with 87 reported last September and 56 in 1927.

Alfalfa in Every Seeding

WE have been gratified in walking over the meadows on a good many farms of the East in the last few years to see how thoroughly thousands of farms have been inoculated with alfalfa and to see this splendid plant springing up everywhere, in many cases mixed with the other grasses, on every meadow on the whole farm. It has become a very common practice of thousands of farmers to sow a little alfalfa seed with the other grass seed, and in most cases this is a splendid practice.

Where the soil is at all favorable to alfalfa, and if the hay is to be fed on the farm, it may be desirable to add from four to ten pounds of inoculated alfalfa seed to the acre in addition to, or in place of a part of the clover seed. The quantity of alfalfa seed to use will vary with conditions. Ontario Variegated or Grimm alfalfa is recommended. Of course, where possible, a full seeding of alfalfa should be considered, and thousands of farmers are now growing Grimm alfalfa with fine results.

If the hay is to be marketed, mixtures should not be considered. Another factor that should be considered is the fact that alfalfa and timothy do not reach the right stage of maturity at the same time. Alfalfa is ready to cut before timothy, but if the mixture is cut to be fed on the farm, then the timothy may be cut with the alfalfa with good results.

NEW YORK STATE HORTICULTURAL SOCIETY

Vol. 124 September 21, 1929 No. 12

In Honor of Useful Lives

REPRESENTATIVES of the Master Farmer Board of Judges are busy this summer visiting nominees for this great honor. Over one hundred nominations were received in New York State. Each of the nominees was sent a very detailed questionnaire. When these were returned, the best qualified were sorted out for a personal visit. From those visited, from ten to fifteen final selections will be made to receive the honor for this year. The awards will be made in person by Governor Franklin D. Roosevelt at a big meeting in New York City on December 12.

The purpose of the Master Farmer movement is to recognize outstanding success in farming and rural citizenship. The nation should honor its leading farmers as it does its soldiers, its scientists and its captains of industry.

Clifford V. Gregory, editor of the *Prairie Farmer*, who started the national Master Farmer movement, said: "It is an inspiration to boys and girls who are growing up in the country to know that success may be the reward of effort on the farm as it is in the city—not only the success that is measured in money, but, what is more important, the success that comes from an upright and useful life in family and community."

Give The Farm Board A Chance

THE ways of Congress are sometimes hard to understand. After years of argument, Congress finally passed the Agricultural Marketing Act, which called for the appointment of a Federal Farm Board to carry out the provisions of the Act. After a great deal of deliberation and scouting around the country, President Hoover finally appointed the eight members who, together with the Secretary of Agriculture, make up the personnel of the Board.

Now our Washington correspondent informs us that Congress is dissatisfied with the appointments to the Farm Board and is going to "investigate" the qualifications of each member. We call this so-called investigation mighty poor business.

AMERICAN AGRICULTURIST has not been enthusiastic about any of the proposed forms of federal farm relief. We have believed that there was as much, or more, danger of injuring agriculture as there was of helping it—especially

eastern agriculture. But now that the Agricultural Marketing Act is passed and the Farm Board appointed, we believe in giving the Board a chance, and certainly Congress should be the last agency in the world to create distrust in its own baby by finding fault with the appointees to the Farm Board.

As a matter of fact, so far as we are able to judge, and we know several of the members, the personnel of the Farm Board is excellent. The appointment of Charles Wilson, a fruit grower of Hall, New York, was very satisfactory to eastern farmers. It is true also that the Board has so far shown a surprisingly large amount of common sense in its preliminary statements and work. Through judicious loans that have been made to various cooperative organizations, including some help to our own eastern cooperatives, many farmers have already been materially helped.

Certain it is, if this Farm Board is going to be of any aid to American farmers, it must have their confidence and support, which confidence is not to be gained by constant fault finding from members of Congress or its committees.

Have You Visited Ticonderoga?

TO one who likes to reflect on the achievements and glories of the past, a visit to old Fort Ticonderoga, pictured on our cover, is a real inspiration. It has been our privilege to visit Ticonderoga several times, and always as we walk the old walls and look out across the mountains and lakes which the fort guards, our imagination is stirred with the brave deeds of other years.

The fort is situated, as you know, on the outlet from Lake George to Lake Champlain. It was fortified by the French in 1755 and was called at first, Carillon. It was the rendezvous of Montcalm's army in 1757, and was unsuccessfully attacked by the British under Abercrombie in 1758. It was invested and taken by the British under Amherst in 1759, all of these engagements being in the old French and Indian Wars.

Ticonderoga now is mostly remembered because of the gallant capture of the fort by Ethan Allen and his Green Mountain Boys in the Revolution in 1775. The door and the passage through which Allen made his surprise attack and entrance are still standing.

As one recalls in imagination all of the old fights which roared around this "Gateway of the North", and those men who were garrisoned there, who ate and slept, worked and thought, and had their being there, he wonders, where are they now, and what was it all for? To be sure, the soldiers and their very names are gone and mostly forgotten, but their brave deeds helped to make possible the foundations of our America, and therefore live on in our hearts.

Contagious Abortion May Be Eradicated

LEADERS of dairy organizations throughout the country are quite excited over the many articles and comments tending to show the relation between undulant or Malta fever in humans and contagious abortion in cattle. Several scientists are claiming that milk from cattle coming from dairy herds in which there is contagious abortion is a dangerous food.

Unfortunately, some of these articles by the scientists are appearing in publications read by the consumer, and do not give both sides. For example, the contagious abortion germ found in milk is destroyed by efficient pasteurization, and it is also true that not all of the scientists and doctors are agreed that such milk is dangerous. These facts should be made clear.

Every dairyman recognizes the truth, however, that contagious abortion is something that we must fight, and fight hard. It is causing millions of dollars in losses to dairymen every year. One prominent farmer made the remark to us recently that he believed there was a connection

between abortion and garget. "At least", said this man, "when I cleaned up my dairy with the blood test for abortion, I no longer had trouble from garget. Before that, my dairy was constantly afflicted."

Dr. H. J. Metzger of the New York State College of Agriculture, recently stated that cattle abortion cannot be cured, but it may be eradicated. He recommends as a means of stamping it out the blood test and the isolation of infected animals. No cure for abortion is known, according to Dr. Metzger, and the purchase of any drug or stock tonic as a cure is a waste of money. The blood test will detect the presence of the disease. A complete discussion is given in a new bulletin by Dr. Metzger, published by the College, which will be sent free of charge to anyone writing to the College of Agriculture at Ithaca and asking for bulletin No. E-182.

Small Crops—Better Prices

SPEAKING generally, the harvests of farm crops throughout America will this year be considerably smaller than they were last year, and a small percentage under the ten-year average. If the history of other short crop years is borne out, the farmers will receive more money for these smaller crops than they did in years when there was heavy production.

Of course, this does not help the man whose crop is a total failure, and who therefore has nothing to sell. But every farmer knows that, taking it year in and year out, he makes more money from an average or small crop. Here is hoping that it will be true this year.

Watch AMERICAN AGRICULTURIST for the next few weeks or until your crops are marketed for constant and accurate reports on harvest and market conditions.

When Interest Rates are High it Slows Up Trade

WE have a peculiar situation in the money market which is of dollars and cents interest to every farmer. There is not enough gold in the world to support the present high level of world prices. We have more than enough gold in this country to keep up our own level of prices, but in order to buy our products, including our farm products, Europe first must borrow gold from us.

To meet this increased demand for gold, and also possibly to put a stop to Wall Street speculation, the Federal Reserve Bank has been constantly raising its interest rates in recent months. The result is that foreign countries are not going to be able to continue to borrow American gold. Money is going to become tight and more difficult to secure all over the world, which may result in a general slowing up of trade, and in particular in the purchase of wheat and other farm products by foreign peoples.

Eastman's Chestnut

OF the countless good stories attributed to Artemus Ward, the best one, perhaps, is one which tells of the advice which he gave to a Southern Railroad conductor soon after the war. The road was in a wretched condition, and the trains were consequently run at a phenomenally low rate of speed. When the conductor was punching his ticket, Artemus remarked:

"Does this railroad company allow passengers to give it advice, if they do so in a respectful manner?"

The conductor replied in gruff tones that he guessed so.

"Well," Artemus went on, "it occurred to me that it would be well to detach the cowcatcher from the front of the engine and hitch it to the rear of the train, for, you see, we are not liable to overtake a cow, but what's to prevent a cow from strolling into this car and biting a passenger?"

Governor Urges Changes in Local Government

For Optional Re-Organization in Town and County Units

WHY must the American people be inconsistent? In our business life and in our social contacts we are little controlled by the methods and practices employed by our forefathers. The farmer of today does not plant, cultivate, harvest and market as did his grandfather. Methods of manufacture and of distribution and of merchandising are entirely unlike those of a century ago. We have made great changes in the budgeting and administration of Federal and State governments. Nevertheless, in almost every state of the union we seem content, in the main, to accept and continue to use the local machinery of government which was first devised generations or even centuries ago.

In the State of New York, for example, I am utterly unable to understand why we remain wedded to the local system of government devised two hundred and fifty years ago by His Royal Highness, the Duke of York.

It has been well said that while in the larger units of American government, at Washington and at the State Capitols, undoubted savings in administrative efficiency can still be made, yet the waste there is a mere drop in the bucket in comparison with the extravagance, the loss, the duplication—yes, the stupidity and, in some cases, the dishonesty—which exists in so many sections in the conduct of local government.

For Americans to be proud of their business efficiency, of their economic progress of all the improvements which have come to us during the past generation, is highly inconsistent with the attitude of the average citizen who without objection allows local government to continue in its time-worn groove of inefficiency.

I do not think that I am overstepping the bounds of truth, and I am fairly familiar with conditions in many States, when I assert that not one percent of the towns and counties of the United States but could save great sums for the taxpayers if they were reorganized along modern business lines.

A Local Problem

It should be clearly understood, of course, that while this problem is nation-wide in its scope, yet its solution cannot be considered from the national standpoint but must be studied first from the state standpoint and, secondly, from the point of view of the dwellers in the counties and towns themselves. While the generalization in regard to the need of reorganization applies to all states, the details vary in each state and, indeed, even in the local units themselves.

That is why I take, merely as an example before this National Tax Conference, the situation which exists today in the State of New York. The lessons from New York may not apply in detail to the other states, but they do apply in principle.

Under the Duke of York's laws the county and the town were recognized as the two units of local government. With practically no exceptions the organization of our counties and towns remains the same today as two hundred and fifty years ago. We now have all the town offices, for example, which existed under the first State Constitution of 1777, with several more added. It is well to remember in dealing with this broad problem that the conditions of life have undergone a revolutionary change. These conditions have changed too, all of our relations in business, but they have not called for

corresponding changes in our agencies of government. In the old days people of a community lived very much within that community with few, if any, outside contacts. Today modern transportation and modern communication have given to many things, which were originally of local concern and, therefore, functions of local government, a far broader sphere.

Cannot Change All at Once

I recognize to the full the sentiment and home pride which clings jealously to the retaining of county and town lines, especially in those parts of the country which have a long standing historical background. As a matter of practical effort, therefore, revolutionary changes in local geographical units would seem to be out of the question

is necessary to maintain a school for \$1,200 to educate three pupils that, of course, should be done, but there are still thousands of districts in this state which, for economic reasons, will be consolidated with other districts in the days to come, and the per capita cost of giving children a modern education will be greatly reduced.

How Town Lines Were Established

The very size of townships is in this state an illustration of the out of date method of their formation. I am reminded of one town whose size was determined, back in the seventeenth century, by the amount of territory that a man could ride a bull around between sunrise and sunset. Some towns are compact, homogeneous units, while

lighting, water supply, concrete roads, special policing, etc. Why should they be governed under a system devised for a sparsely settled agricultural community?

The other side of the picture relates to the relief of local units of government through functions which are no longer purely local even though the geography of the local units may remain the same. Let me cite some examples.

During the early history of the country, roads, for instance, were used almost exclusively by the people living within a given community, and it was proper that they should be required to maintain these roads. Now, however, almost no road is a local road and this function of government, originally a purely local town function, has now become one of county and state concern.

Any Change Wholly Optional

I know of no business reason, and can think of none, why the town as a unit of administration of highway expenditure should longer exist. I shall propose to the next Legislature that the citizens of any county in this state may in their discretion substitute a county highway organization for the present large number of town highway organizations—one in each town—which now exist. If an enabling act of this kind is passed, and if the counties of this state shall avail themselves of the act, it will result in the substitution of fifty-seven county highway organizations in the place of the nine hundred and thirty-three existing town highway departments. Were this a purely business proposition the decision would be immediately and promptly made. It would result in building more and better town highways for the same amount of money. More than that, it would result in the opening up of vast areas of the State of New York which today, because they are off a concrete state road, have shown no increase in value and have shown steadily decreasing populations.

Another example: Except for the fact that larger health districts are permissible, the town is still the unit for health administration in rural communities. With modern means of transportation no good reason exists in most cases for that form of administration. Disease germs are no respectors of political boundary lines. They will flit from one town to another without the slightest thrill when they pass over town lines. There is no doubt that administrative health units larger than the town are imperative in these modern times.

Why Not Eliminate Collectors?

Still another example: Every two years in this state we elect in each town a collector of taxes—over 930 of them in all. In the old days when a horse and buggy furnished the most rapid means of communication, a town collector's existence was justified. The town collector today is paid by the fee system and there is a definite premium for his own pocketbook if he lets a collection of taxes slide and later gets a higher fee for the delay. It would be right, of course, in some towns to provide, as a matter of convenience, some central point and some one individual—say the town clerk—who might receive the payment of bills voluntarily brought in. But, in the main, the principal tax collecting agency might well be the office of the County Treasurer.

I shall ask the next Legislature for enabling legislation which would allow

If Changes Are Made YOU Will Have To Make Them

MORE than seven hundred delegates, representing forty-five states in the Union, several provinces of Canada, and other foreign countries, met last week in the twenty-second annual tax conference of the National Tax Association.

To show the growing interest in farm tax problems on the part of tax experts who make a business of studying the tax situation, the most important part of this conference was devoted to farm taxes, and there was almost united agreement that real estate of all kinds, and particularly farm real estate, is grossly unfairly taxed in proportion to other property.

The high spot of the whole week was reached in the banquet on Wednesday evening when nearly a thousand persons interested in tax problems heard Governor Franklin D. Roosevelt and ex-Governor Frank O. Lowden of Illinois discuss the rural tax situation. Governor Roosevelt's address is given on this page. Governor Lowden's will appear in an early issue.

We urge that every reader of American Agriculturist study this talk of Governor Roosevelt very carefully. You may not agree with all of his suggestions, but you will agree that no progress can be made in finding a solution for the present situation in rural taxes until rural people themselves take an interest in and study the problem.

In reading what Governor Roosevelt said about re-organization of town and county government, let us call your attention to his statements that it is not possible to make very many radical changes at a time, and that any progress must be made slowly. Also note the Governor's suggestion that no changes should be made in any county without the consent of the local people. In other words, he recognizes that it is *your* problem.

for immediate relief. We do not put through great reforms all at one time. We must seek what can be practically accomplished even though the process may be piecemeal.

The two main aspects of this problem are: First, what can be accomplished towards the consolidation and reorganization of local units of government and, secondly, if we leave local units of government as they now exist, how we can relieve them of functions which are not purely local.

In regard to the consolidation and reorganization of local units of government only one step has been so far taken in this state. I refer to the consolidation of many of the small school districts. I must frankly acknowledge that the process is a slow one, for in the State of New York there are over seven thousand one and two-room schools still in existence. Nevertheless, the start has been made. I have every respect for the little red school house; I am inspired by its sentiment and traditions. However, in these days of the automobile and improved highways, the important thing is to provide adequate educational facilities and to do it in the way least burdensome to the taxpayers. If for geographical reasons it

others with scanty populations sprawl over wide areas. We have instances of two adjoining towns, both using the same community center, and if the law were changed wholly capable of being joined into one political unit, thus eliminating 50% of the combined totals of the two sets of town officials.

In this same connection it is worth while noting that a differentiation must be made between counties which are mainly agricultural and other counties which are almost wholly suburban. For instance, in Nassau County, on Long Island, the greater part of the area of the county lies within the limit of incorporated villages. Yet in addition to the officials of these villages there exist complete sets of town officers who have jurisdiction over the fringes of land outside the incorporated villages. This brings up the serious question as to the necessity for town government in the suburban counties. Why have many complete sets of officials whose jurisdiction and duties overlap?

It is time for the recognition of the new phenomenon of the widely growing suburban areas which are constantly increasing in size, in wealth, and at the same time in the demands for all kinds of public improvements—sewers,

REFRIGERATION FROM OIL HEAT

Luxurious Convenience

—oil-burning SUPERFEX furnishes

Refrigeration all through the Year

SUMMER days may be over—but refrigeration is a year around luxurious convenience. Makeshift methods of keeping food are neither sure, safe nor economical.

As little as from one to four cents a day will keep food pure, clean and cold. SUPERFEX in your kitchen will save you many, many steps this fall and winter—next summer you will wonder how you ever did without it!

Homes on electric power lines have been enjoying year around refrigeration for quite some time. Now the new invention—SUPERFEX, the Oil-Burning Refrigerator—brings this modern convenience to rural homes everywhere.

No electricity or gas required. Once a day you light the SUPERFEX burners—then forget them. Twenty-four to thirty-six hours of continuous, food-preserving cold are yours for a trifle.

SUPERFEX freezes ice cubes and makes easily possible many new salads and desserts. It is a luxurious convenience that eliminates the bothersome, tiresome trips to cave, cellar or springhouse.

Trouble-proof—Safe

SUPERFEX is noiseless. No valves, no gears, no belts; no moving parts. No drains. No "servicing."

Moderate Prices—Convenient Terms

SUPERFEX is made in a wide range of sizes and styles. Prices \$198.00 and upward f. o. b. factory. See SUPERFEX at your dealer's store. He will arrange terms to suit you. If you do not find SUPERFEX in your town, please write us for name of nearest dealer.

Let us send you handsomely illustrated literature—just mail the coupon.

NO ICE TO CUT

Forget about cutting and storing ice this winter. End expensive ice hauling next summer. SUPERFEX does away with this—install yours now!

NEW MILK CHILLER

The SUPERFEX oil-burning principle is now used in a chiller that reduces milk to 40° in 3 minutes. Details gladly mailed you. Write!

SUPERFEX

OIL BURNING Refrigerator

Superfex is manufactured and guaranteed by the

Soya Beans for Feeding Cows

TWO weeks ago in my notes on a

By M. C. BURRITT

vanced in a time of short crop.

short trip in the corn belt, I mentioned soya beans and the interest which the eastern dairyman has in this crop. Now I want to tell the story of soya beans as a source of concentrated feeding protein and the reasons why all feeders should have a new interest in this crop.

The growing of soya beans commercially as a source of oil and of feeding meal is a new industry in this country, having developed almost entirely within the last ten years. It seems almost certain that there will be a natural and steady increase in the acreage and production of these beans in the United States and that they may become one of the staple crops of the country.

M. C. Burritt

While soya bean growing is relatively new in the United States, in Manchuria the soya is one of the oldest crops having been grown there for more than three thousand years. The industry there is very large too. It is said that nearly one-fourth of the total area under cultivation is planted to these beans. Manchuria produces approximately 4,000,000 tons of beans or about one-half of the total world supply. Of this tonnage more than one-half is exported as oil and oil cake (meal). The remainder is used at home both for human food and cattle feed.

We have much to learn about beans from Manchuria with its three thousand varieties and its centuries of experience. The U. S. Government has an expert - an old schoolmate of mine by the way - in Manchuria now, studying the growing and processing of the beans, and searching for better varieties.

The reason for the great interest in soya beans in this country now is the growing shortage of concentrates. The principal sources of supply of proteins for feeding stuffs are cotton seed, linseed, gluten feed and meal, peanut meal and soya beans. The total supply of these supplementary protein feeds manufactured in 1928 as given by Prof. Savage follows:

Cottonseed meal.....	2,300,000 tons
Gluten meal and feed.....	600,000 tons
Linseed oil meal.....	675,000 tons
Peanut oil meal.....	25,000 tons
Soybean oil meal.....	26,000 tons
Total.....	3,626,000 tons

The same authority estimates that the requirements of 22,000,000 dairy cows in the United States, conservatively put at 400 pounds per cow annually, calls for 4,400,000 tons or nearly a million tons in excess of the supply. And there are 34,000,000 beef cattle and 59,000,000 hogs in addition whose best and most economical feeding depends on a complete ration containing an adequate supply of supplementary protein.

It should be noted that each of the sources of supplementary protein, except the last, is a by-product from the production of other staples. This means that the supply is not grown for the feeder primarily, but only incidentally, and that it depends almost entirely upon the demand for and the price of cotton, flax, corn and peanuts, all of which have other and major uses. Hence the price which the dairyman pays may be very much affected by the supply of cotton which yields about one pound of seed normally valued at about 2½ cents for each pound of cotton usually worth about 20 cents. Moreover, these by-products are as a rule rather closely controlled by a few large manufacturers, and are therefore, subject to being cornered and the prices further ad-

This then is an important problem for the eastern dairyman in particular because he is one of the heaviest buyers of supplementary protein. There are three possible answers to it. He can:

1. Use less protein - substituting 16 and 20 per cent feeds for 20 and 24 per cent feeds in accordance with circumstances.

2. Grow more protein at home - mainly alfalfa and clovers - where this is possible.

3. Stimulate and encourage the growth of soya beans in the middle west by making favorable contracts for growing them and by providing a regular and dependable outlet to his mills.

It is probable that he will need to do all three things. But it is particularly important that the soya bean industry be expanded at this time. The oil is needed in industry where it has many uses, as well as the feed for cattle feeding. The feeds are rapidly becoming the major use, however, the whole beans being crushed for this purpose. The soya bean fits well into the corn belt rotations and offers an excellent substitute for oats, now an unprofitable crop. There are other reasons why soya bean growing is likely to be materially increased in the next few years which I may sketch in later notes.

Control Peach Leaf Curl

BECAUSE of the spread and the ravages of the peach leaf curl we are glad to call attention to a statement recently issued by the New York State College of Agriculture regarding the necessity for spraying to control this disease and the time and other directions for putting on the spray. This statement follows:

Fall Spraying

Although the fruit grower may dislike the thought of getting out the sprayer again after a busy season, he should take no chances in controlling peach leaf curl. Of course, the spraying may be done in the spring, but at that time the mud may be too deep for hauling the heavy machinery, or other work may be too pressing to permit the spray to be applied early enough. If a fall application is made there is no doubt of the fungicide being present in time to prevent infection.

How Disease Spreads

The spores of the curl fungus live over winter among the hairs of the bud scales and their germ tubes are able to gain an entrance into the young leaf during the first rain period after the bud begins to swell in the spring. Any spray applied after this happens might as well have been thrown away so far as control of the leaf curl is concerned.

When to Spray

The spraying should not be done until all the old leaves are off the tree, but before freezing weather arrives. If the nights are very cold, the applications should be made near the middle of the day when the sun will dry the spray quickly.

What to Use

The material to use is lime-sulphur, 7 gallons with 93 gallons of water, or if San Jose scale is present, it should be more concentrated. The liquid should be applied as a fine mist so that each bud will be coated. Special care should be exercised to hit all the terminals by applying from opposite directions, or if a ground lead of hose is used, the operator should spray from all sides of the tree.

One for all *and* all for one

A business stands or falls with its customers. If the goods or service it sells renders a profit to both parties concerned—fine! If it doesn't,—well, you know what happens.

In the feed business, the manufacturer must make and sell feeds that can make money for the feeder. His obligation to do this is as great as if the customer were a legal, instead of a moral, partner. They are both in business for their common benefit, and can only help each other by working together.

The buyer needs the feed, and the seller needs the customer. And the customer will continue to be a customer only as long as the feed he buys earns a profit for him.

So it's up to the manufacturer to do his best to make a feed that will pro-

duce. The better the feed, the more prosperous the customer — prosperity that is mirrored in the size of the manufacturer's business.

The wise manufacturer tests his feeds beforehand on experimental farms and in research laboratories. Testing with a creative intent—because it points the way to improved feeds and new discoveries in feeding practice. All of which means greater profits for the farmer.

Recognition of the partnership principle has made Park and Pollard more than anxious to excel in the development and making of profit-producing feeds. By striving for maximum *consumer* profits it has won hundreds of thousands of loyal partners. A profitable partnership for all concerned.

The Park & Pollard Co

Boston, Mass. Buffalo, N. Y.

The Dairy Industry Needs Concrete

For Dairy Barn Flooring its Sanitary Qualities are unsurpassed. Concrete Flooring is an important factor in the Production of Clean Milk and in the Eradication of Infectious Diseases as Contagious Abortion, Tuberculosis and Contagious Mastitis.

It can be cleaned easily, quickly and thoroughly by scraping or by flushing.

It can be disinfected easily, quickly and thoroughly.

It is durable against wear.

It will not rot, swell or disintegrate because of flushing or disinfection.

It provides no corners, crevices, cracks or other lodging places for filth.

It does not absorb odor-producing filth.

The PAGE HAND POWER MILKER

Lowest Price Ever Offered

Easy To Operate

It's Portable—Wheel It Anywhere and Start Milking

No Installation Expense—No Pipes—No Pulsator

Our surprisingly low factory price on this 2-cow Hand Power Milker makes it the lowest priced milker per milking unit ever offered. And for only \$12.50 extra a third cow attachment can be added enabling you to milk 3 cows at once. Thousands in use. Easy to operate.

\$5 DOWN AFTER FREE TRIAL

No other milker on the market can compare with the PAGE for low price—ease of operation and milking efficiency. We let you prove it before you pay. We will put this PAGE Hand Power Milker in your barn on FREE TRIAL. See the time and work it saves; see how soothing its action on the cows and how sanitary and easy to clean. Then if satisfied, pay only \$5 down, balance in easy monthly payments.

10 MONTHS TO PAY 10 YEARS' GUARANTEE

This Page Milker is portable—no pipe lines to install—no pulsator—no tanks—no expensive special pails; just wheel it in and start milking. Milks right into your own shipping can.

Liberal Exchange Privilege

Should you later wish a PAGE 2 or 4 cow gas engine or electric Milker you can trade in your PAGE Hand Power Milker on very liberal terms.

Write For Free Book Get the facts about the lowest priced milker which pays for itself in short time. Don't delay—this liberal No Money Down offer only good until we have an agent in your locality. User Agents Wanted.

With the A. A. DAIRYMAN

What Becomes of the Poor Cows

HOWARD Elridge, Marilla, Erie County, N. Y. the Farm Bureau Committeeman and successful dairyman gave a short discussion of the dairy problems in Erie County. It is worth passing on. The occasion was the annual meeting of the Erie County Dairy Herd Improvement Association. The group had been discussing the problems that effect the income on Erie County Dairy Farmers. Poor cows, poor feeding, diseases, the prevalence of the habits of buying cows rather than the efficient raising of young stock, lack of reading the program that included keeping transmitting bulls were all mentioned as major problems. The contribution which deserves repeating which Mr. Elridge made was in connection with the poor cows. He said that after he had given his cows a chance to produce by feeding them good roughage and grain according to their production and they failed to meet his standards, he immediately sold them to the butcher and not a dealer or to a neighbor. If cows went wrong with udder or breeding trouble, he did the same thing with them. Poor cows like bad money should be taken out of circulation. This is one essential practice that will aid in getting better cows on New York State Farms.

Storm Forecast for Dairymen

AT A MEETING of the College of Agriculture Milk Stabilization Committee the other day Dr. C. E. Ladd, Chairman of the State Stabilization Committee made the following suggestions which will be of considerable interest to the dairymen in the Milk Shed. He outlined a two or three day storm forecast which would be wired to the county agent's office which would be mailed to the dairymen requesting the service the same day that a drop in temperature is coming or that a severe storm is coming. For example if the forecast this morning indicated that tomorrow night there would be a severe drop in temperature accompanied by a storm, this information would be wired to the county agent's office. A letter would be mimeographed immediately to the dairymen in the county, reaching them on the following morning. This would give them an opportunity to keep their cows in the stable that night in anticipation of a severe drop in temperature and a storm. Further details for the perfection of this service will be announced later through the local farm bureaus.—FRED B. MORRIS, Assistant County Agent Leader, New York.

Tightening Rusted Silo Hoops

ARE you sure that the hoops on your silo are tight enough to prevent air leaking in and spoiling the silage? Often the threads and the nuts become rusted together and it seems impossible to draw them up. First go over all the nuts and threads with a can of kerosene or of penetrating oil, putting this on several times and allowing plenty of time for it to work in. Sometimes this will permit the nut to be loosened slightly.

When the kerosene fails to loosen it, this can often be done by holding a heavy hammer or axe under the nut and striking it on top with another hammer. Still another way is to slip a sheet of tin or asbestos paper behind the joint, then turn the flame from a blowtorch on the nut, then try to loosen it while the nut is hot.

Once the nut is partially loosened, it is usually possible, by using kerosene liberally and turning the nut backward and forward, gradually to tighten the most obstinate nut. Where the staves have shrunk and the nut comes up to

Farm service demands CHAMPION dependability

Trucks, tractors and stationary engines as well as your motor car must under all conditions be dependable units in the business routine of the farm. Farmers the world over know the absolute dependability of Champion Spark Plugs for every farm engine, and every operating condition.

The greatest single factor in spark plug efficiency is the insulator. For on it ultimately depends the maintenance of peak efficiency, irrespective of operating speeds, temperatures and pressures. If the insulator is of inferior quality, engine performance and economy are greatly impaired.

Champion sillimanite—nature's finest insulator—is a rare mineral used exclusively in Champion Spark Plugs.

Possessed of a natural high resistance to electric, heat and mechanical shock, it is ideally adapted to withstand the ravages of combustion, and the intense pressures and temperatures of modern engines.

Sillimanite is your guarantee of Champion's superior performance. Champion Spark Plugs in engine driven farm equipment insure maximum efficiency, economy and dependability.

the end of the thread without tightening the hoop, one remedy is to remove the nut and slip on heavy washers or even sections cut from a gas pipe of the proper size, while another way is to slip under the hoop strips of galvanized iron or similar material of roll roofing.—I. W. DICKERSON.

Let Veterinarian Examine Dead Animals

"About two months ago we lost a brood sow. She acted perfectly all right until I found her dead. When I found her, her intestines protruded, her nose and mouth were bloody and she was all bloated up and turned purple. I couldn't understand what could have happened to her but finally decided that she must have choked to death on a piece of glass, a nail or something like that. I thought no more about losing the hog but yesterday morning I found another dead under exactly the same circumstances. The first hog was due to farrow within a week when she died. She had a fairly clean pen and was in with other hogs. The second hog had already farrowed when she died, and the pigs had been removed about two weeks. Her pen was rather dirty and she was also in with other hogs. I was feeding both hogs all the whey they could drink once a day with a little feed. Can you tell me what caused the hogs to die and the remedy, if any?"—V. S., New York.

THE symptoms you give are too meagre for anyone to attempt an accurate diagnosis. The protruding intestines and the bloody nose and mouth would accompany a severe bloat from any cause and an animal would bloat in this weather in twenty-four hours, regardless of the cause of death.

If I had been in your place, I would have sent for your local veterinarian and had him post the second animal that died. If you have lost any more in the meantime, get into touch with him at once, so that he may obtain fresh specimens on which to work or which he may forward to the College here.—PROF. R. B. HINMAN.

The Pennsylvania Ton Litter

MANY Pennsylvania farmers interested in growing hogs have joined ton litter clubs in an effort to grow a ton of pork in a certain limited time from one litter of pigs.

It is stated that 80 per cent of the 486 ton litters which have been grown during the last five years were fed on what is known as the Pennsylvania ton litter ration.

This ration consists of 4 parts of ground shelled corn, 3 parts of ground whole oats, 2 parts of middlings, and one part of tankage of fishmeal. It is fed either in the dry condition or as a thick slop.

Among the advantages claimed for the ration is that 70 per cent of the feeds are farm-grown grains and the remainder can be purchased from any feed dealer. There is enough variety to make the ration highly palatable. The carbohydrates are balanced with animal protein which has been found more efficient in swine feeding than vegetable protein. There is not so large a percentage of oats in the ration as to make it objectionable and the oat hulls supply the necessary and proper amount of fiber to make the feed digestible and to supply the bulk essential to development of a large digestive system.

Only one mixture is needed for all kinds of hogs, the sire, sows and young pigs receiving the same feed with beneficial results. Ton litter growers have used the ration for the first four months of the prescribed feeding period to develop large framework in the pigs and then have finished the fattening in the last two months with a ration of 9 parts of corn and 1 part of tankage, or have used a self-feeder with corn in one compartment and tankage in the other.

Important factors needing attention in the dairy industry today are: (1) Greater efficiency in production; (2) Production of the highest quality in dairy products; (3) Increasing the consumption of dairy products. O. E. Reed, Chief Bureau of Dairy Industry, U. S. Dept. of Agriculture.

FISHKILL FARMS

offer the following

Yearling Bulls

FISHKILL HENGERVELD PIEBE—A son of the noted show bull KING PIEBE 19TH, whose dam, SOLDENE BEETS DEKOL, has a record of 33.43 lbs. butter in 7 days and 1,113.83 lbs. butter in 365 days as a five year old. On the dam's side this young bull traces back to DUTCHLAND COLANTHA SIR INKA, one of the best sons of that greatest of all milk sires, COLANTHA JOHANNA LAD. A great combination of producing families.

FISHKILL COLANTHA PONTIAC—his dam FISHKILL PONTIAC DEKOL INKA, a daughter of DUTCHLAND COLANTHA SIR INKA, made a record at the age of 2 years, 11 months and 15 days of 493.72 lbs. butter and 11,012.20 lbs. milk in 365 days.

FISHKILL AAGGIE INKA PIEBE—a very richly bred young bull whose ancestors all represent high producing blood lines. His dam has a 7 day record as a two year old of 21.55 lbs. butter, and record made in class "C" of 697.12 lbs. butter and 14,373.4 lbs. milk in 365 days. This is on twice a day milking. This young bull's sire is a grandson of the great KING PIETRTJE ORMSBY PIEBE, while his dam is a granddaughter of the great DUTCHLAND COLANTHA SIR INKA.

FISHKILL MAID HENGERVELD—A son of DUTCHLAND INKA COLANTHA MAID. One of her daughters, FISHKILL INKA LADY DEKOL, made a record of 11,741.8 lbs. butter at 2 years, 11 months. This was the highest two year old fat record in America in 1927 and 1928.

FISHKILL PIEBE BEAUTY—a son of the great KING PIEBE 19TH, a great show bull and a son of a 33 lb. cow and a grandson of ROSE DEKOL WAYNE BUTTER BOY, who holds a 365 day record of 1,213.81 lbs. butter in 365 days, being the only cow to hold such a record and at the same time have four daughters that have produced over 1,000 lbs. of butter in a year. This young bull's dam traces back to DUTCHLAND COLANTHA SIR INKA.

FISHKILL PIEBE INKA—The dam of this young bull made a record of 12,500 lbs. milk in 365 days on twice a day milking. She traces twice to DUTCHLAND COLANTHA SIR INKA. This young bull's sire is the famous KING PIEBE 19TH, whose entire pedigree is rich in blood lines of high producers and comes from a family of show ring ribbon winners.

FISHKILL FANNIE INKA DEKOL PIEBE—A son of the great proven show bull KING PIEBE 19TH, who combines the blood of two famous animals—ROSE DEKOL WAYNE BUTTER BOY the only 1,200 lb. cow that has four 1,000 lb. daughters, and KING PIETRTJE ORMSBY PIEBE, whose get have won more grand championships and first prizes at the greatest shows of the country than the get of any other sire that ever lived. This young bull's dam is from a line of high producers tracing twice to the greatest of all milk sires COLANTHA JOHANNA LAD.

Reviewing the Latest Eastern Markets

Milk Prices

The following are the Sept. prices for milk in the basic zone of 201-210 miles from New York City.

Dairymen's League prices are based on milk testing 3.5%. Sheffield on the basis of 3%.

Class	Dairymen's League	Sheffield Producers
1 Fluid Milk	3.37	3.17
2 Fluid Cream		2.10
2A Fluid Cream	2.26	
2B Cond. Milk		
Soft Cheese	2.51	
3 Evap. Cond. Milk Powder		
Hard Cheese	2.25	2.05
4 Butter and American cheese. Based on New York City Market quotations on butter and American cheese.		

The Class 1 League price for September 1928 was 3.42 for 3.5% milk and Sheffield's 3.17 for 3%. The above prices in each class are not the final prices the farmer receives. The final price received from the dealer is the result of the weighted average.

August Prices Announced

The Dairymen's League announces the following pool prices for August for 3.5% milk.

Gross	\$2.63
Expenses	.06
Net Pool	2.57
Certificates of Indebtedness	.15
Net Cash Price to Farmers	2.42

August 1928, Net CASH Price, 3.5% milk	\$2.53
August 1928, Net POOL Price, 3.5% milk	\$2.63
August 1927, Net CASH Price, 3.5% milk	\$2.32
August 1927, Net POOL Price, 3.5% milk	\$2.42
August 1926, Net CASH Price, 3% milk	\$2.26
August 1926, Net POOL Price, 3% milk	\$2.36

The Sheffield Producers announce the cash price to producers for 3% milk in the 201-210 mile zone, as \$2.56 per hundred, (\$2.76 for 3.5% milk).

August 1928 price to producer, 3% milk, \$2.60; 3.5%, \$2.80	
August 1927 price to producer, 3% milk, \$2.44; 3.5%, \$2.64	
August 1926 price to producer, 3% milk, \$2.37; 3.5%, \$2.57	

Butter Loses, Then Gains Ground

CREAMERY SALTED	Sept. 13, 1929	Sept. 6, 1929	Last Year
Higher than extra	46 1/2-47	45 1/2-46	50 -50 1/2
Extra (92sc)	46	45	49 1/2
44-91 score	40 -45 1/2	39 1/2-44 1/2	45 -49
Lower G'ds	38 1/2-39 1/2	38 -39	43 -44 1/2

The butter market has been an up and down affair since last week's report. The week opened with a one half cent advance over the quotations we

gave last week. On Tuesday, the 10th, there was another unexpected advance principally due to the fact that fancy butter was hard to get. However, this strained the situation, for on the 11th the price fell off a half cent on creamery extras. This tightened up the market for sellers refused to accept the lower rates on goods carried over.

The weakness was apparently only momentary for on the 12th the market showed a much firmer tone. There was greater buying interest in evidence. On the 13th, the market showed sufficient strength to entirely overcome Wednesday's loss and now the market rests at the quotations as given above. Buyers seem to need stock and they do not hesitate to pay the current rates.

Government report for September 1 shows that the holdings of butter in the warehouses of the country total 168,974,000 lbs. compared with 136,175,000 lbs. on September 1 a year ago. The excess holdings on Aug. 1 were 31,177,000 lbs. which shows that the instorage movement is still going on. Apparently the shrinkage has not been as heavy as some anticipated.

Cheese Still Trends Upward

STATE FLATS	Sept. 13, 1929	Sept. 6, 1929	Last Year
Fresh Fancy	24 -25 1/2	24 -25 1/2	26 -
Fresh Av'ge			
Held Fancy	27 1/2-29 1/2	27 1/2-29 1/2	24 -25
Held Av'ge			

The cheese market is still on the upward movement and although prices at this writing show no change officially, everything points to an advance. Dealers are more conservative in their offerings because of the higher replacement costs now prevailing. Fresh Western cheese cannot be sold on the New York market at prevailing quotations except at a loss, which shows how much country prices are above prices in the Metropolitan district. There is a very limited amount of fresh New York State cheese available and anything that grades as extra fancy easily brings 25c with pet marks a half cent higher. If the situation continues we look for an advance next week.

Cooler Weather Helps Egg Market

NEARBY WHITE	Sept. 13, 1929	Sept. 6, 1929	Last Year
Hennery			
Selected Extras	53 -58	51-56	56-59
Average Extras	49 -52	48-50	52-55
Extra Firsts	41 -47	41-47	40-48
Firsts	37 -40	37-40	35-38
Undergrades	35 1/2-36	35-36	34 -
Pullets	33 -40	33-40	32-37
Pewees	23 -30	23-30	29-30
NEARBY BROWNS			
Hennery	47 -54	46-52	44-50
Gathered	36 -46	36-45	36-43

The change in the temperature and lighter posted receipts have brought relief to the egg market, which brings prices more closely in line with those of a year ago. If the quality of the bulk of the arrivals were better there is no doubt that we would see even better prices. A good many of the arrivals show the effect of holding and the hot weather still shows some effect. There is a surplus of intermediate grades which naturally would cause a sluggish market. The market on fine quality eggs is firm. Rather than use the medium grade eggs at current rates many operators are swinging to the better quality storage eggs. We have reached the point now where good quality storage eggs are going to compete with the so-called fresh product that shows the effect of being not so fresh. Therefore, we look for an improvement on the higher classifications whereas intermediates are going to have a more difficult time.

Colored Fowls Scarce

FOWLS	Sept. 13, 1929	Sept. 6, 1929	Last Year
Colored	31-33	30-32	27-32
Leghorn	18-23	25-27	19-22
CHICKENS			
Colored	26-35		28-35
Leghorn	26-28		25-28
BROILERS			
Colored	-38	25-33	
Leghorn	-38	26-28	
OLD ROOSTERS	-23	-23	
TURKEYS	40-45	35-42	
DUCKS, Nearby	23-28	23-27	26-30
GESE			

There are very few colored fowls arriving by express and they are in real

demand. Radio listeners who were on their toes and had stuff to sell undoubtedly profited this week. Leghorn fowls on the other hand are in heavy accumulation and are trending downward. The above conditions reflect the situation throughout the entire poultry market, freight arrivals being light on colored fowls and heavy on Leghorns.

Roasting chickens by express have not been too plentiful and they are turning firmer. Some Leghorns are selling as high as 30c. Pullets and broilers cover a wide range, some sell up to 38c and a few fancy bring more in a peddling way.

HEBREW HOLIDAYS

NEW YEAR—Oct. 5-6, 1929. Best market days, Oct. 1-2-3, 1929. Kinds most in demand: Fat fowl, turkeys, ducks and geese.

DAY OF ATONEMENT—Oct. 14, 1929. Best market days, Oct. 10-11, 1929. Kinds most in demand: All prime stock wanted, especially spring chickens and roosters.

FEAST OF TABERNACLES—Oct. 18-19, 1929. Best market days, Oct. 15-16-17, 1929. Kinds most in demand: Fat fowls, ducks and fat geese especially.

Demand for Fruit Slow

The demand during the week was slow all through on account of most of the stock being of undergrade quality. High grade, large sized fruits brought higher prices than previous week and sold fairly readily. Crab apples, plums and grapes were particularly slow sellers.

APPLES—Hudson Valley: bushel baskets, U. S. Grade No. 1, Alexander 2 1/2-3 inch \$1.50-2.25; Duchess 2 1/2 inch mostly \$1.50; Gravenstein 2 1/2 inch and upward \$1.50-2.25; Rhode Island Greenings 2 1/2 inch \$1.75-2.25, 2 3/4-3 inch \$2.25-2.75; McIntosh, 2 1/2 inch \$2.25-2.75; Twenty Ounce 2 1/2 inch \$2.00-2.50, 2 3/4-3 inch \$2.50-3.00; Fall Pippin 2 1/2 inch \$1.75-2.25, 2 3/4-3 inch \$2.25-2.75; Wealthy 2 1/2 inch \$1.75-2.25, 2 3/4 inch \$2.00-2.75; Wolf River 2 1/2 inch \$1.25, 2 3/4-3 inch \$1.50-2.00; Winter Banana 2 1/2 inch \$2.00-2.50. U. S. Grade No. 1, 2 1/4 inch fruit, various varieties, ranged from \$1.00-1.50; unclassified, 2 1/4 inch and upward ranged from 75c-\$1.50. Western New York Sections: barrels, Wealthy U. S. No. 1 2 1/2 inch \$5.00; commercial pack 2 1/4 inch \$3.50.

CRAB APPLES—Hudson Valley: wide range in size, quality and variety, per bushel basket \$2.00-2.50; per 12 quart basket 25c-\$1.00.

GRAPES—Hudson Valley: per gift crate (eight baskets) wide range in pack and quality, various varieties, blue 75c-\$1.25; Delaware 75c-\$1.50; Niagara 65c-\$1.25; 12 quart climax basket, all varieties 45-60c.

PEACHES—Hudson Valley: wide range in pack, quality and color of fruit, Elberta, per bushel basket, best, \$1.50-2.75; poor, small 75c-\$1.00; per carrier of six four-quart basket \$2.25-3.00; per 12 quart basket, best \$1.00-1.35; poorer, small 50-75c. Hale, per crate, \$2.50-3.50.

PEARS—Hudson Valley and Western New York Sections and Oswego County: Bartlett, per bushel basket, fancy pack, best \$2.50-3.00, extra fancy large \$3.25-3.50, ordinary \$1.75-2.25; small \$1.25-2.00; Clapps Favorite, per bushel basket, fancy pack \$2.75-3.00, few extra fancy large \$3.25, ordinary \$2.00-2.25; small \$1.25-1.75; Seckel wide range in size and quality \$2.00-4.00.

PLUMS—Hudson Valley: Damson, per 12 quart climax basket \$1.00-1.25 per four quart basket 25-50c.

Potatoes Regain Strength and Advance

For a few days last week the potato market was in an easy position and this week the market opened up in a similar condition. On the 10th however, the trade started to stiffen up a bit and on the 11th it turned much firmer and has continued so for the balance of the week. All sections are sharing in the firmness and the market is advancing especially on Maines. Long Islands are bringing \$4.75 to \$5.25 for the

best in 150 lb. sacks. Long Islands in bulk are generally bringing from \$5.75 to \$6.00 per 180 lbs. Maines in 150 lb. sacks are bringing from \$4.35 to \$4.60 while bulk goods are quoted at from \$5 to \$5.40 per 180 lbs.

Vegetables

CABBAGE—Western New York: white, domestic, per sack of about 80 pounds, store sales, best, mostly \$1.85, poorer \$1.65; pier and yard sales, sacks of 80 pounds \$1.65-1.75; 90 pound sacks \$1.75-1.90; bulk stock, per ton basis, mainly \$40.00-45.00, occasionally small retail sales reported slightly higher. Catskill Mountain Area: per cauliflowerer crate, white \$1.00-1.50.

CELERY—Upstate, stock in the rough, wide range in pack, size, quality and condition, per two-thirds crate \$1.50-2.50; half crate 50c-\$1.50, a few \$1.75; quarter-crate \$1.00; per bunch 25-50c.

LETTUCE—Big Boston, per crate of 24 heads, Western New York, Oswego and Madison Counties: 10-65c, a few 75c.

CUCUMBERS—Per bushel basket, wide range quality and pack, No. 1's 35c-\$1.50, a few \$2.00; dills \$1.25-1.75, pickles and counts ranged to \$1.75; 16 quart basket \$1.00-1.50; four quart basket 75c-\$1.00.

ONIONS—Orange County: store sales, per 50 pound bag, yellow, mostly around \$1.00; white boilers \$1.25-1.50; poorer 75c-\$1.00; picklers \$2.00-2.75, poorer \$1.25-1.50; sacks of 100 pounds, yellows \$1.50-2.25; reds \$2.00-2.25. Madison County: store sales, yellow, per 100 pound bag \$1.50-2.25; 50 pound bag \$1.10-1.25. Pier sales, yellows, per 100 pound bag, \$2.00 delivered.

SQUASH—Oswego County: per bushel basket, yellow crooked neck 50-75c; white 50-75c; green Italian 75c-\$2.00.

TOMATOES—Various varieties, per carrier of six four-quart basket 75c-\$2.25; fair quality \$1.00-1.50; ordinary to poor 75c-\$1.00; per 12 quart climax basket, No. 1's 50-75c; No. 2's 25-30c.

Hay Receipts Liberal

Receipts were again liberal especially at Brooklyn. Coupled with a limited demand prices declined \$1.00 per ton under the previous week's close. At the close, however, the demand was improving and prices were showing a tendency to firmness for the top grades. Supplies consisted principally of small bales, with a heavy proportion grading, Nos. 2 and 3. Low-grade hay was extremely difficult to sell except at concessions. Straw receipts moderate, demand active, prices advanced \$1.00 per ton. Oat \$15-16; Rye \$18-19. Timothy in large bales generally brought \$24 to \$25 for No. 1 grade, with No. 2 bringing on the average \$2 less. Sample sold as low as \$13. Mixtures containing grass or clover have not brought more than \$22, and most of it sold below that figure, generally around \$18.

Farm News from New York

Dairymen from the New York Milk Shed to Attend National Dairy Show

REQUESTS for information concerning the American Agriculturist-New York Central train to the National Dairy Show are coming in the office every day. The plans at present are that the train will leave Grand Central Station, New York City, at 5:00 p. m. standard time, on Sunday, October 13, and will arrive at St. Louis at 5:30 p. m. Monday.

Several years ago when the National Dairy Show was held at Syracuse in New York State, there were approximately 80,000 people in attendance at the show. For the past two years the show has been at Memphis, Tenn. and the attendance has been approximately 270,000. This should give dairymen in the New York Milk Shed some idea of the interest in dairying in the southern and middle western states. Naturally, these dairymen have their eyes turned toward the New York market and we believe that it will be worth any dairyman's time to go to St. Louis and see for himself what is being done to increase dairying in that section of the country.

Anyone who is interested in taking this trip can get full information by writing to American Agriculturist, 461 Fourth Avenue, New York, N. Y.

High School Boys at the State Fair

ONE of the inspiring events at the recent State Fair was the program put on by the boys who are taking vocational agriculture in New York State high schools. One of the principal events was a speaking contest. Eight boys representing different sections in the state, gave original talks on some topic relating to farming. Harry Stanley of Marathon won first prize; Grant Sharp of Hoosick Falls, second place and Hughes Dearlove of Bath won third place. The boys who have enrolled in high school courses in agriculture have organized into a group known as the Young Farmers of New York. This association has selected Howard Hill of Albion, president of the State Association and Lloyd Pinkney, president of the local Young Farmers' Club at Web-

ster, to represent the association at the annual meeting of the Future Farmers of America to be held at Kansas City in November.

The Future Farmers of America is the national organization of boys taking vocational agriculture in high schools. Nearly 600 of these boys attended the State Fair and took part in the activities arranged for them.

Pageants Commemorate Sullivan-Clinton Expedition

THE last of the historical pageants to celebrate the 150th anniversary of the Sullivan-Clinton expedition of Revolutionary times are scheduled as follows:

September 21, Saturday, Geneva; 22, Sunday, Kershong; 23, Monday, Kendala; 23, Monday, Canoga; 24, Tuesday, Union Springs; 24, Tuesday, Cayuga Castle; 25-28, Wednesday to Saturday, Elmira, Meeting of New York State Historical Ass'n. 27, Friday, Horseheads; 27, Friday, Ithaca; 27, Friday, Montour Falls; 27, Friday, Painted Post; 28, Saturday, Elmira; 28, Saturday, Newton Battlefield.

As a picturesque ending to the pageants held at Geneva and Elmira, Indian Long Houses together with small cornfields will be burned. In the expedition many such burnings took place to make way for civilization by the whites.

Agricultural Publishers' Association Conducts Prize Contest

OPPORTUNITY is offered for some farm boy or girl to realize a cash profit on his or her knowledge of farm conditions. The Agricultural Publishers' Association, of which this paper is a member, has offered prizes of \$250, \$150 and \$100 for the three best theses on either of two subjects: (a) The Farm Market for Commodities, or (b) Selling Commodities to farmers. Contestants must be seniors or graduate students of some college or university.

A committee of three nationally known advertising men has been selected to

make the awards. These judges are: John Benson, president, American Association of Advertising Agencies; Chas. C. Younggreen, president, Advertising Federation of America and Henry L. Staples, former member of the Harvard Award Committee.

You may have a boy or girl in college whom you want to compete for the prizes that have been offered. Complete details of the contest can be secured by writing to V. F. Hayden, Executive Secretary, Agricultural Publishers Association, 360 N. Michigan Ave., Chicago, Ill.

H. E. Dibble Dies Following Auto Crash

THE many friends of Harold E. Dibble of Honeoye Falls were shocked to learn of his sudden death at Strong Memorial Hospital, Rochester. Death resulted from injury sustained in an automo-

bile accident near Conesus Lake on August 17.

He was a graduate of Cornell University and also attended the University of Wisconsin for one year. Mr. Dibble leaves a wife and two daughters.

Gas from Corn Stalks

ABOUT 1500 members of the American Chemical Society have been meeting at Minneapolis, Minn. One talk of particular interest to farmers concerned the utilization of corn stalks. In addition to the manufacture of paper and other valuable products, it is claimed that from a tank 8 ft. in diameter and 8 ft. deep, enough gas could be produced from corn stalks to supply all the needs of a family of four or five. It is estimated that 8 square miles of corn land could produce enough corn stalks to supply gas for a city of 80,000 inhabitants.

New York County Notes

Cayuga County—Farmers have taken advantage of the wonderful weather for the past few weeks to secure the second cutting of alfalfa in fine condition. Many fields of clover and other grasses are also yielding the second crop. Corn is maturing rapidly and though we are not really suffering for rain, at this writing, Sept. 5th, we are still pretty dry and wells are low. Threshing is going forward rapidly as well as ploughing for wheat. Advice from the Imperial Valley, California indicates that growers received for wheat this year the lowest price paid.

Sullivan County—The men folks are very busy cutting their corn and digging potatoes. Corn is a good crop and potatoes are fair. The women folks are busy doing canning, pickling and preparing for the cold weather meals. Many springs and wells have gone dry, as there has not been a generous rain since June. Eggs are 50c to 55c, butter 40c to 50c a pound. Feed has taken a raise in price. Apples will be a very light crop and cabbage also. Peaches are being brought in and sold for \$1.00 a basket, lovely ones at that.—P. E.

Schoharie County—A much needed rain came to this county on the 9th. Some farmers had been compelled to draw water several miles for their cows. The Farm Bureau held their 13th Annual Picnic at Charlotteville, August 23 with an attendance of 2500. On August 29, 3000 attended Old Home Day at Jefferson. Labor Day celebrations were held at Richmondville. The Cobleskill Fair will be the week of September 23. Threshing oats and buckwheat is farmers' work now. Eggs are 45c, potatoes 59c a peck.—Mrs. L. McM

Rensselaer County—In Saturday's paper it was announced the churches of Troy would pray for rain. We had a shower on Saturday, and today, Monday, September 9, a steady rain is coming. Only a few potatoes are still green. This was the longest dry weather ever known.—F.

Cortland County—The drouth so prevalent in other sections was beginning to be left here. Springs and wells were getting low, and rain was needed very badly. Potato and cabbage vines are very promising, with lighter yields if the dry weather had continued. Early cabbage

brought \$30.00 to \$35.00 per ton, while potatoes are \$1.75 to \$2.00 per bushel. Farm Bureau agent, H. L. Vaughn has purchased the old Purlee farm near McLean. He intends to operate it with tenant farmer, in connection with his regular duties. W.N.G.

Saratoga County—The county and state fairs are nearly over. More from this vicinity attend the New York State Fair at Syracuse every year. The Saratoga Co. Fair at Ballston was better than ever, all report. Many from here attended the fair at Rutland, Vermont. Oat threshing is nearly completed. No silos around this vicinity are filled, but farmers expect to begin soon. The weather is very warm. A number of bad fires were near here recently. The dry weather was growing serious, the wells and cisterns were getting very low.—L. U. P.

Columbia County—The principal event in the county this past week was the Chatham Fair. 35,000 attended on Labor Day, which was 7,000 more than any day's previous record. Primary grades will attend school in Grange Hall, Kinderhook, until the school building is ready. About forty acres in Ghent were burned over by forest fires, 600 men and two fire departments worked under Fire Warden Harms. The Veterans of Foreign Wars have raised \$1475 through contributions for their new home in Hudson. The water supply in Hudson was very short. The situation was quite serious. The Garden Club of Kinderhook made bouquets for the hospital. Butter is 50c a pound, eggs, 50c a dozen in trade at the country stores. Potatoes are \$2.25 a bushel.—C. V. H.

Potter County—Dry weather continues. Pastures are very dry. Frost has damaged buckwheat, corn and gardens in the exposed places. Oats are very light. Unless the next month has especially good growing weather the late potato crop will be far below the estimate. Eggs bring 40 to 42c, dairy butter 50c, potatoes \$2 to \$2.40, poultry 23c, white honey 25c. Mrs. H. E. J.

We had a heavy frost July 19th and August 19th. Many fields of buckwheat and corn injured. Potter County Farmers' Annual Picnic attended by about 1500 people. New Dairymen's League cooling station at Millport is nearly completed. The hiking cows, Alice and Tomboy passed within a few miles of us, on their long journey.—M. C. S.

Northampton County—After continued dry weather we are having very heavy showers. The corn looks good, some very good. Fruit of all kinds will be scarce in this section. Corn is \$1.00 a bushel and wheat \$1.20 per bushel, eggs 48c, butter 59c. Feed is very high. It seems that all locations have different prices. The farmers are preparing for seeding. A farmers' basket picnic was held in Union with the Kiwanis of Bangor on August 29 at Johnsonville.—F. P. H.

Crawford County—Crops are not up to usual standard because of dryness. The outlook for corn, oats and buckwheat is a poor yield. Early potatoes are below expectation even for those who sprayed them well. Frost hit the low fields August 20 and caused much damage for some by killing potato tops, injuring corn and buckwheat and one man's large cucumber patch was entirely killed. Three fine young bulls from high producing high testing herds have been delivered to those who will keep them for Crawford County's first Jersey Bull Association.—Mrs. C. B. L.

Farm Organizations Object to Tariff Bill

IT SEEMS probable that the discussion of the tariff will occupy much time in Congress this fall. It has even been suggested that the new tariff bill will not be enacted into law at the coming session. Recently twelve leading farm organizations sent a communication to the Senate in which they severely criticized the tariff bill as revised by the Finance Committee. One schedule particularly mentioned was the one on vegetable oils and fats. It was recommended that vegetable oils have a basic tariff rate of 45 per cent with appropriate specific duties. A request was also made that the tariff on dried whole milk and casein be 10c per pound on dried whole milk and 8c a pound on casein. The rate recommended on cheese was 8c a pound, but not less than 40 per cent ad valorem.

Large importations of frozen and dried eggs from China have constituted a problem for local poultrymen. The farm organizations have recommended a tariff of 12c a pound on frozen eggs and 36c a pound on whole dried eggs, 30c a pound on dried egg yolks and 60c a pound on egg albumen. In addition to a number of other specific recommendations these farm organizations put themselves on record as favoring the removal of the tariff on all fertilizer materials.

The report as sent to the Senate was signed by: Fred Brenckman, representing the National Grange Patrons of Husbandry; Chester H. Gray, representing the American Farm Bureau Federation; Charles W. Holman, representing the National Cooperative Milk Producers Federation; A. M. Loomis representing the National Dairy Union; F. E. Mollin, representing the American National Livestock Association; J. B. Wilson, representing the National Wool Marketing Council; J. A. Arnold, representing the Southern Tariff Association; R. L. Adams,

representing advisory board Growers Tariff League; Louis F. Miller, representing Vegetable Growers Association of America; J. H. Mercer, representing Kansas State Livestock Association; J. S. Montgomery, representing Central Cooperative Association and C. A. Stewart, representing National Livestock Producers Association.

It will also be of interest to producers of farm products to know that a resolution was recently passed in the Senate, calling for information from income tax reports of those seeking tariff increases on manufactured products. The resolution provides that the Committee on Finance may request from the secretary of the treasury, the information needed.

Farm Board Makes Loan to G. L. F.

THE Federal Farm Board today announced that it has agreed to make a loan of \$50,000. to the Cooperative Grange League Federation Exchange, Inc., of Ithaca, N. Y., to be used for the purchase or construction of marketing facilities at a number of New York State railroad shipping stations.

These facilities are to afford grading, packing and loading services to farmer cooperative groups in the different communities, which are members of the federation.

The application for the loan sets forth that it is proposed to provide these marketing facilities at not fewer than ten nor more than fifteen shipping stations. The maximum cost of each unit will not exceed \$8,000. Of the sum used, the Board will advance 50 per cent and the federation an equal amount, the government's loan to be secured by a first lien on the property.

Mr. H. E. Babcock, General Manager,

and other officers of the federation appeared before the Board August 12th and presented information on the character of their organization and the proposal to expand its marketing program. It was said the federation has some 35,000 farmer stockholders and serves about 80,000 patrons.

Mr. Babcock said that the federation's program calls for the establishment of only a few units at the outset, but later the service will be extended to other shipping points, thus enabling farmers throughout western New York cooperatively to provide themselves with the necessary facilities for marketing their agricultural products.

Officials of the GLF Exchange wish to emphasize that the GLF has no intention of rushing into handling produce, but that it is simply cooperating with the Federal Farm Board to study the problem and to make a beginning toward solving it.

Little Recipes for Little Cooks

by *Betty*

Lesson Number Seven

DEAR LITTLE COOKS:

Wouldn't it be fun to have a picture of all the little cooks together? It would take a pretty big camera to get us all in, wouldn't it? So many nice letters come and I wish I could know you all real well, but I feel that we are good friends even if most of you do live far away. We are all using the same recipes and thinking about being good little cooks and helping at home. It makes it so much more fun to know that there are so many others doing the same things, too.

Only a little vacation left. Are you glad or sorry? I guess I am a little of each. My sister Helen, who is six, will start this fall. We go to the school in town because it is the same distance as the country school and we get lots more rides to town. We don't have hot lunches in our school because most of the children go home at noon, but we have thermos bottles in our lunch boxes and we can have hot soup or cocoa and it tastes awfully good, too.

Then we have little glass jars (that hold about half a cup) with screw tops and in these we take salad or fruit gelatin or sauce for dessert. Very soon I'll tell you about some good sandwiches for your school lunch.

Betty

YOU WILL NEED A HOT OVEN FOR BAKING THESE RECIPES

A Nice Fruit Pudding

In August when the apples are ripe and there are lots of them I like to make this pudding with apples.

First, I butter a small baking dish and then I peel and core a good apple and slice it in thin slices. These slices I put in cold water into which I have put a little salt. I do this to keep the apples from getting all dark brown as they would if they stood uncovered while I was getting the rest of my pudding ready. Then I get ready:

- ½ egg beaten
- 2 tablespoons melted butter
- 2½ tablespoons milk
- ¼ teaspoon vanilla

These I mix well in a bowl. Next I measure into another bowl the dry things:

- ¼ cup sugar
- Few grains of salt
- ¾ teaspoon baking powder
- ½ cup flour, sifted

Then I put the two, the dry and the liquid together and beat well with my spoon.

When I have this, which I call my batter or dough, ready I put the slices of apple neatly in the bottom of the buttered baking dish. I sprinkle the apples thickly with sugar (and a little cinnamon if you like it) and then I pour the batter or dough over and spread it smoothly. Now it is ready to bake in a rather hot oven.

It takes about 30 minutes to cook the apples and dough well and I test it with a toothpick before I take it out of the oven. You know how mother does. If the pick comes out sticky, it isn't done. If not sticky, it's all done.

To Serve the Pudding

I turn my pudding upside down on a small plate or saucer. Plain cream or whipped cream tastes very good with it.

Peaches are awfully good instead of apples and I always wish I could pick all I wanted off the trees like some of the little cooks can who live farther south. In the winter I sometimes make this with crushed pineapple. It's good. For that I put a thicker layer of butter on the baking dish and on this I sprinkle brown sugar

quite thickly. Then comes the layer of pineapple and the batter just as before.

Family Sized Recipe (For Six)

- Six apples and 1 cup sugar
- 2 eggs beaten
- ¾ cup milk
- ½ cup melted butter
- 1 teaspoon vanilla
- Dry materials:
- 2 cups flour, sifted with baking powder
- 3 teaspoons baking powder
- 1 cup sugar
- ¼ teaspoon salt

Stuffed Tomato

While you have lots of ripe tomatoes, wouldn't you like to make stuffed baked tomato? This is the way I do it:

First of all I see that the oven will be quite hot. Then I choose a nice, smooth, round tomato, quite a large one. I wash and wipe it carefully and cut a little hole in the top. Then with a small spoon I scoop out the inside. I have to do this real carefully or I will break the tomato and then I should have to start with a new tomato. When I have the center of the tomato all out and put in a bowl, I add:

- 3 tablespoons of cracker or bread crumbs made very fine
- 1 teaspoon of melted butter
- ½ teaspoon salt
- Few grains of pepper
- 1 teaspoon of sugar (if you like sugar on cooked tomato)

I stir all this well with the tomato pulp that I took out.

Now I am ready to stuff my tomato. I put it all in my hollow tomato, heaping it up well, if I have enough stuffing. Then I place my tomato in a small baking dish and bake it until it is all soft, but not until it gets so soft that it falls all to pieces because I want it to look pretty as well as taste good. When I serve it I put a sprig of parsley in the top that just finishes it up fine.

Sometimes I add finely chopped cold ham to the stuffing or cold hamburger or ground cold beefsteak, but when I add meat I do not put in sugar. Cold sweet corn can be put in this stuffing if you like.

Stuffing for Six Tomatoes

- 1 cup soft fine bread crumbs
- 2 tablespoons melted butter
- 1 teaspoon salt
- 2 tablespoons sugar, if liked
- Pinch of pepper
- (Use about 1 cup chopped cooked meat if you like and no sugar)

Chocolate Drop Cookies

Small Recipe

- ¼ cup of brown sugar.
- 2 tablespoons of melted shortening.
- 2 tablespoons milk.
- 6 tablespoons flour.
- ¼ teaspoon soda.
- ¼ teaspoon vanilla.
- ½ square chocolate, melted.
- 2 tablespoons nut meats, chopped or cut fine.
- ½ egg beaten well (an egg yoke may be used if desired.)
- Pinch of salt.

Large Recipe

- 1 cup brown sugar (white will do.)
- ½ cup shortening, melted.
- ½ cup milk.
- 2 eggs well beaten or 4 yolks.
- 1½ cups flour.
- 1 teaspoon soda
- 2 squares chocolate.
- 1 cup nuts chopped or cut fine.
- 1 teaspoon vanilla.
- ¼ teaspoon salt.

First of all, I put the chocolate to melt in a small dish set into the top of the teakettle. Then I put the ½ egg I need into a bowl and beat very light. Next I add the sugar and stir well. When this is done, I add melted shortening, melted chocolate, vanilla, salt, milk and beat more. Then I sift some flour and measure out what I need. I sift this flour with the soda and add to the other things in the bowl. I stir the flour in well and beat with my spoon till it is all smooth. My cookies are all made now except for the nuts which I add last. (You really don't need the nuts but they taste good if you have some to use.)

Grease a cookie pan real well and then drop the cookie dough by spoonfuls. I know you have often watched your mother doing this and will know how much to drop for each cookie and how far apart they should be.

Bake in an oven that is neither very hot nor very slow.

This little recipe makes a plate of cookies for supper. When you can make them nicely, mother will let you try the big recipe and when you want something 'specially fine you will like to frost these cookies with cocoa frosting.

There Are Still Some Scrapbooks Left

Every little boy and girl can still get all the lessons that have been printed. They will come right with the scrap book you order. Just send 10 cents to Betty, c/o AMERICAN AGRICULTURIST, 461 Fourth Ave., New York, N. Y.

Governor Urges Changes in Local Government

(Continued from Page 5)

the citizens of a county, if they so wished it, to place the duty of collecting taxes in the office of the County Treasurer, providing at the same time for the sending out of tax bills in uniform form, with definite notation thereon telling each taxpayer what his money was going to be used for; how much was to go to the state; how much to the county; how much for roads; how much for schools, etc., etc. It has been estimated that the consolidation of tax collecting, under a county official, would save the taxpayers of this state over a half a million dollars a year by the elimination of unnecessary existing town officials.

So Many Peace Justices Not Needed

Finally, it is right that we should give serious consideration to the office of Justice of the Peace. These town officials are in most cases paid by fees. Their duties are threefold—to hold and commit violators of the law; to try minor violations of the law, sitting as magistrates; and to hear and try small civil actions happening within their town. In most cases Justices of the Peace have had no legal training, and, while most of them are conscientious in the exercise of their functions, the great majority of the Justice of the Peace courts in this state give unsatisfactory and, in many cases, costly justice. Simplified and less costly justice for the average citizen is a crying need of the whole nation. One of the first steps will be to reorganize the whole system of Justices' courts, retaining possibly some individual in every township, who shall have the jurisdiction of a committing magistrate but placing the trial of both criminal and civil cases in the hands of qualified and trained Judges. By this means we shall gain much, both for better justice and for the saving of the taxpayer's pocket-books.

It is worthy of note that on February 1, 1923 a committee of the New York Legislature rendered a report in which it was said "There is no point at which larger or more immediate governmental improvements can be made at the present time in the State of New York than in county, town and village government. In this report we are able to point to an annual saving of some \$2,620,000, which can be made by the adoption of the specific minor recommendations we have to make. It is not possible to estimate the savings which would result from the adoption of the major suggestions but they would total many millions of dollars. Our recommendations have not been confined to economy. We have given equal attention to the matter of better government and in some cases our suggestions would require increased appropriations. On the whole, however, the plans we are outlining would result in a substantial reduction in the tax burden, as well as in better service."

This report was rendered to the Legislature more than six years ago. Since that time no definite steps have been taken by the Legislature to make effective these specific recommendations. No steps have been taken which would have saved the taxpayers of this state \$15,000,000 in the past six years, nor the major suggestions which the committee reported would save many more millions of dollars. My predecessor has called this to the attention of many Legislatures. It is time for action.

Let me say that I consider this one of the major outstanding problems confronting the people of the State of New York. I consider that it is the major outstanding problem in almost every other state. I hope that next year New York will have the courage, the common sense, and the will, through its Legislature, to start this definite reform. I want to see this state save millions in taxes for the benefit of the present generation, but even more I want to see our generations reorganize and improve an outworn system for the sake of those sons and daughters who come after us.

The LYNN Range Oil Burner

As Important in the Kitchen as the TRACTOR on the farm

The LYNN is a revelation in modern kitchen efficiency and economy Now you can cook and heat this easier, cleaner, more modern way — with more saving in fuel than you ever thought possible. No coal or wood no dirt and ashes

The LYNN Has These Outstanding Advantages

1. Clean, Silent, Odorless, Automatic
2. Simple in Construction, Unique in Design
3. Needs no Attention, can be operated by a child
4. Burns without waste, cheap 38° to 42° Furnace Oil
5. Can be easily installed in less than an hour's time.
6. Safe—cannot get out of order
7. Needs only occasional cleaning
8. Low in cost—lasts for years
9. Made—Sold—Guaranteed by one of New England's Oldest and Largest builders of high grade machinery

DEALERS Wanted

Desirable territories are open to Progressive Dealers. Write us for complete information about this fast selling, profit making, easily serviced Range Oil Burner

Post Your Farm And Keep Trespassers Off

We have had some new signs made up of extra heavy material because severe storms will tear and otherwise make useless a lighter constructed material. We unreservedly advise farmers to post their land and the notices we have prepared comply in all respects with the laws of New York, New Jersey and Pennsylvania. The price to subscribers is 95 cents a dozen, the same rate applying to larger quantities. Cash must accompany order.

Now These Rich Steaming Oats

in 2½ to 5 minutes

Get these fine
premiums with the
coupons in each box

HOT nourishing oatmeal—
with the rich old-fash-
ioned porridge flavor. How the
family loves it. And it's good for
them besides, for the whole grain
nourishment it contains builds
brawn and brain—gives vigor and
stimulation.

Now deny your family no
longer. For Mother's Oats comes
two ways: the regular, as you
have always known it, and the
quick-cooking (Quick Mother's
Oats)—that takes but 2½ to 5
minutes to prepare.

The tang of these *crushed* oats,
with their full flavor, whets the
morning appetite. The plumpest
choicest oats that grow—a bushel
yields but 10 lbs. of these flakes.

A coupon in every package

With Mother's Oats you get the
most useful and attractive premi-
ums. Silverware guaranteed for 20
years—china—14-karat gold shell
jewelry—books—toys—almost
everything! Things you've wanted,
felt perhaps you couldn't afford.

Save the Mother's Oats Cou-
pons and they're yours. But be
sure you get Mother's Oats. At
all grocers. And write today for
big free catalog of premiums.
Address: Mother's Coupon Dept.,
Room 1708, 80 E. Jackson St.,
Chicago, Ill.

The makers of Mother's Oats also make Quaker Oats and Quick
Quaker Oats, which you may have been accustomed to buying.
They use the same care in selection, the same high standards of
millin_g, that have made the name Quaker a household word.

Mother's Oats

Mother's Oats comes in 2 styles, the Regular and
Quick Mother's that cooks in 2½ to 5 minutes

Get Fall Plantings In

Many Things Need Starting before Winter

WITH summer on the wane, we are
reminded that it is time to plan
and start plantings for next year.
Many flowers may be planted or trans-
planted now, while shrubs and trees
are very partial to late fall for trans-
planting.

First of all, and we cannot say this
too often, there should be a very de-
finite plan of planting. Hap-hazard,
skip-hop-and-jump effects are just as

wreath, syringa, white and purple li-
lacs, forsythia, flowering almond,
flowering quince, hydrangea, phlox,
sweet-william, larkspur, bleeding heart,
iris, peony, rose, arbor vita are some
of the common ones. I know one yellow
barberry shrub that is almost a hun-
dred years old and is still in its prime.
I could mention two or three peony
clumps almost as old and every week
I see specimens of box at least two
generations old and still thriving. It
would seem that if one wanted to plant
something for the next generation to
enjoy, a planting of box would prove
such a legacy.

No planting scheme is complete
without its perennials, its bulbs and
its annuals. This article is concerned
chiefly with what is to be planted or
transplanted at this season. That
means that the annuals are set aside
with one swoop until spring.

To get blossoms next year, peonies
should be planted this fall. Divide the
fleshy roots, being sure to keep from
two to five "eyes" and cover them two

Lady's unbleach-
ed muslin APRON
NO. C1531 is a
most attractive de-
sign for general
use. The material
is of excellent
quality and will
improve with ser-
vice. Enough ma-
terial for two poc-
kets is provided.
The price of this
apron, postpaid to
any address, is
only 45c. Address

turalist, 461 Fourth
Ave., New York
City.

disquieting in the outdoor arrange-
ment as a living-room which has its
furniture set anglewise, its rugs askew
and its pictures all "anyway." The feel-
ing of restfulness and spaciousness re-
quires broad stretches of green grass,
orderly placing of shrubs and flowers
with due regard to size, color and sea-
son of blooming. A misplaced flower
bed often completely spoils the effect
of harmony which could be obtained
by uninterrupted lawn bordered by
hedge or flowers.

Shade trees placed where shade is
needed help any place to look more
friendly and comfortable. Too much
shade makes it look damp, forbidding
and unkempt.

Therefore it is a fine scheme to sit
down and plan the whole layout on
paper. If the place is old and has some
plantings already, they can be charted
and made a part of the picture. Some
may need transplanting. If so, fall is
as good a time as any for moving them.
As soon as the first frost comes or
when leaves change color the change
can be made. Even large trees are
transplanted, the main care being to
get a large ball of earth around the
root system.

Many trees growing wild are fine
for shade around the house and, pro-
vided the question of ownership is set-
tled satisfactorily, they can be moved
from the woods. Practically any of
these trees could be thus obtained in
these parts, except the flowering dog-
wood which is protected by New York
State law; it can be purchased from
the nurseryman: sugar maple, Norway
maple, dogwood, beech, white ash, wal-
nut, white oak, scarlet oak, red oak,
American elm. Others easily obtained
from the nursery are flowering crab,
Oriental plane, linden, and black cherry.

House is Center of Interest

The house should always be the cen-
ter of the picture and, according to the
landscape artists, should not be viewed
through a prison-bar effect of many
parallel tree trunks across the front
of the lawn. A few well placed trees
are better than a great many in a row.

No place seems quite complete with-
